With regard to fevers, there can be no doubt that they change their type at different periods, as is well known to those who have attended to the practice of the London Fever Hospital, or other large Fever Hospitals. The annual reports of such Hospitals show a constant fluctuation in the proportion of typhoid or abdominal fever, and of typhus or low fever; and Dr. MURCHISON shows that in the year 1830 the prevailing fever in England was typhus, and that the inflammatory or relapsing kind of fever, although it had previously been very common, had then become very rare. It is very easy to understand that bleeding, whether judiciously or injudiciously employed, did less harm in the inflammatory than in the typhus fever. Now, we apprehend

that those who argue for the existence of a change of type in diseases do nothing more than assert what the records of Fever Hospitals abundantly prove—namely, that different kinds of fever prevail at different times, and may require different treatment. If such is proved to be the case with fevers, it is neither incredible nor improbable that other diseases may also undergo a change of type, or what is pretty much the same thing, that a sthenic class of diseases may prevail at one time, and an asthenic one at another.

THE PUMPS IN THE CITY OF LONDON.

A FULL report on the pumps and wells of the city has just been presented to the Corporation of London by their indefatigable Health Officer, Dr. LETHEBY. The results of a large number of analyses, extending over a period of five years, are embodied in this report. There are, it appears, thirty-five pumps in the city, the quantity of saline and organic matter ranges from 26.63 grains to 129.73 grains in the gallon. During the past month the water of the new river contained 17.16 grains, and that of the East London 18.18. There are only six wells in the city with less than 50, and two others with less than 70 grains per gallon. Ten contain from 70 to 80 grains; nine from 80 to 90 grains, and two from 90 to 100 grains in the gallon. There are five wells in the city, the water of which contains from 100 to 130 grains of solid matter in each gallon. These wells are in Aldgate, High-street; Bishopsgate-street; Leadenhall-market; Milton-street, Cripplegate; and St. Nicholas Olave Churchyard.

Not only is the solid matter thus excessive, but its constituents demonstrate the origin of the pollution. Thus, the water of Leadenhall-market pump, contains 40 grains of common salt per gallon, besides a large quantity of nitre and organic matter, evidently derived from the hides exposed for sale. The wells in the city churchyards and their neighbourhood contain saltpetre and ammonia. Of the saltpetre, from 20 to 30 grains in the gallon. This is, doubtless, the final product of the decay of the bodies buried in the locality. Other wells are contaminated with the oxidised products of sewage escaped from neighbouring drains. Nearly every one is largely impregnated with the compounds taken up during the percolation through the foul soil of the city. In places where the soil is protected this obtains to a less extent. The two pumps at Guildhall are examples, but even these are so much tainted, that Dr. LETHEBY considers it dangerous to use the water for drinking purposes.

These waters are all rendered more dangerous by their bright sparkling appearance and cool agreeable taste; for these qualities are, in fact, derived from the decay of organic matter. In the outbreak of cholera in 1854, it was observed that those who drank the water of the Broad-street pump died of the disease, while those who had not almost uniformly escaped. Moreover, persons at a distance, who had had this water sent to them on account of its supposed purity, also died of cholera.

Enquiry proved that the well had suddenly been polluted by cesspool drainage.

This illustrates one danger to which all wells in cities are at every moment liable; but apart from this, it is not to be supposed that the habitual use of water charged with organic matter may not insidiously affect the health.

Dr. LETHEBY illustrates his opinions by a reference to the epidemics of 1848-9 and 1853-4 in which the effects of impure water are strikingly manifest. In both those outbreaks the southern districts of London were most severely visited, and on each occasion the persons who suffered most were found to have drunk the worst water. Two companies drawing their water from the Thames supplied the inhabitants. In one case the water contained a much larger quantity of organic matter than the other; and although the conditions of the districts were otherwise the same, the inhabitants using this water suffered a much larger mortality than those consuming the other. But in the second epidemic the circumstances were just the reverse. The water of the old company, which was formerly the worst, was now the best, and the mortality of its consumers three and a half times less than that of their neighbours. To these warnings one more is added, on the authority of Sir JAMES MCGREGOR, who relates that when the British army was in Spain, 20,000 soldiers were buried in a rather small space of ground; and after two or three months the troops who drank the water from the wells of the neighbourhood were attacked with dysentery and malignant fevers. Yet in the city churchyards there are the remains of ten times such a buried army undergoing decay; and not long since, in the whole metropolis, 50,000 bodies were buried in the year in a space of not more than 218 acres. In a generation of thirty years this would amount to a million and a half of decomposing bodies in the surface soil of London, and through these remains the water percolates into the shallow wells. From these and other considerations, Dr. LETHEBY concludes that the water from the surface wells of the metropolis, contaminated as they are with the refuse of drains and the soakings from graveyards, is unfit for public use, and that no natural process of oxidation can render it safe. He advises, therefore, that none of the water furnished by the city pumps—nor, in fact, by any of the pumps of London—should be used for domestic purposes.

THE DEPRESSING PASSIONS IN RELATION TO CHOLERA.

Dr. FORBES WINSLOW has written a letter in the *Pall Mall Gazette*, with a view of representing the necessity of keeping the mind tranquil as a preventive against cholera. He calls attention to the fact that persons may in many instances be exposed with impunity for a length of time to the most virulent contagion if the mind remains in a fearless and unanxious condition, whereas those who are most timid are most likely to fall victims to the disease. Dr. Winslow's opinion and advice are not uncalled for at the present period, when many persons are in such a state of terror as to produce, if not actual cholera, at least some very alarming

mental and even corporeal disturbances. The daily publication of the details of cholera cases in the newspapers tends very much to perpetuate and intensify this state of mental perturbation: and although it would perhaps be unwise to prevent the journals from giving forth their cholera experiences to the world, yet even from this source some good may be derived, if people will turn their sympathies towards their suffering neighbours, and thus divert the feelings which would otherwise be concentrated on themselves.

Correspondence.

THE ELIMINATIVE TREATMENT OF CHOLERA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In his letter on "the Eliminative Treatment of Cholera," published in your issue of the 8th inst., Dr. Mapother observes "the contagion introduced from Liverpool seems to have been confined to the members of the family first attacked, but with so many of the English ports infected, we can scarcely expect to escape from other importations." If these words were intended to imply that cholera is chiefly, or generally, propagated by contagion, or, from a person who is ill of it to another who is not, I would beg of Dr. Mapother, and of any others who hold that opinion, to examine the report published by the "Commissioners of Health (Ireland)," after the fever and cholera epidemics of 1846-50. These commissioners were Sir P. Crampton, Sir H. Marsh, and Dr. (now Sir D.) Corrigan. It is well known that the last-named particularly gave the most laborious attention to the duties of that important situation, and having previously had ample professional experience in respect to cholera, we may be sure that, when officially issuing instructions regarding the measures proper to be adopted in the event of the re-appearance of that disease in this country, he and his colleagues did so on grounds which they had good reason to believe to be founded on the numerous facts that were reported to them, and on those which were known to themselves. In September, 1848, these commissioners issued a circular, in which they observe that, "though fever is highly contagious, or easily propagated from one individual to another, all experience shows that cholera is rarely, if ever contagious, and that the friends and relatives of the sick may be under no apprehension of catching the disease, and need not be deterred from affording to the sick in their own dwellings every needful assistance and attention."

The Commissioners state in that important circular (which, in my opinion, ought to be published in every newspaper at present), "that this view of the subject has an important bearing upon the measures to be adopted in meeting a visitation of cholera, not by an extended system of hospital accommodation, such as is needful in epidemics of fever, but recommend in preference a general system of prompt and efficient dispensary relief." But they add that, "as there is always, particularly in cities, a large class of destitute persons who have neither friends nor the means of support, to such persons efficient relief cannot be afforded except in hospitals."

These were the Commissioners' opinions when, in 1848, they issued their circular respecting the arrangements necessary to be made for the treatment of cholera. In August, 1850, the Lord Lieutenant, through the Chief Secretary, requests that "as the Commissioners will no doubt have been enabled to acquire much information which may be hereafter most useful should a similar visitation ever occur again, they will furnish him with a report embodying their views on this important subject"—the epidemics of fever and cholera—"as such a document would be most valuable." When thus called upon the Commissioners made their report,

and conclude it by stating, "we have nothing to alter or modify in the advice given in our circular of September, 1848, with regard to future arrangements, should cholera unfortunately again visit us, which, in reference to medical treatment, may be summed up in providing prompt dispensary attendance for the sick poor who may wish to remain in their own homes, and hospital accommodation for those who stand in need of it."

Until those well-considered opinions of the Commissioners of Health are shown to be erroneous in respect to the non-contagious nature of cholera, it would seem that the measures recommended by them ought to be preferable to those that are suggested by some influential parties, and that much public benefit would result from the adoption of those recommended by those Medical Commissioners; there would be far less expense, far less loss of life, I believe, and far less social discomforts amongst the class which is most liable to be attacked by this disease.

I conclude by requesting the attention of those who hold that cholera is mostly or much propagated by contagion, to the well-known and melancholy fact, that numerous medical men and others who are in close attendance on fever patients, as clergymen, nurses, &c., have taken fever and have died of it, and that the reverse, in a very remarkable degree, has been the case as regards their attendance on cholera. A few have died of it, but, comparatively, very few.

I hope I may add that, having had a large practice in the cholera period of 1832, and having as the Poor-law Medical Inspector visited most if not all the workhouses and other hospitals in which much cholera was treated in 1849, all my inquiries (and they were many and anxious), and all my experience concur in the views published in the Commissioners of Health's Report.

DENIS PHELAN.

August 17, 1866.

LONDON WORKHOUSES AND INFIRMARIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As your journal has a character for much fairness, holding the balance between contending parties, it would be well to say that Dr. Edward Smith's Report on London Workhouses gives 1000 cubic feet as existing already in some of the wards, though the newspapers "sensationalise" the fact that in some others it is only 500. Bence Jones, Dr. Todd, Edward Smith himself, Pettenkoffer, Angus Smith, &c., are quoted to show that about 600 is enough, and the great error is in reality bad ventilation; and even with 800 or 600, and notably with 1200, the nurses and paupers are so cold and shivering, they stop up all inlets or outlets of ventilation.

"Marked cleanliness" is the condition of all the workhouses, says Dr. E. Smith. "Even the old ones, Holborn and Poplar, vied with the new ones," in this; but "ventilation is almost everywhere defective." There are "paid nurses, too, in all or nearly all the workhouses," and so of other things so often denied.

"Pilfering of stimulants does not exist only as a very exceptional thing;" but a mountain has been made out of this mole-hill of an exception, and so of several other abuses, as they have been styled, so that it would be very unsafe for our able men like Dr. Mapother, or Dr. MacCormac of Belfast, to generalise too much on bad arrangement, overcrowding, &c., in London workhouses, from sensationalisms copied from one paper to a dozen others without examination.

—I am, &c.,

ERINENSIS.

VIVISECTIONS IN ENGLAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A little while ago a violent agitation existed in the public mind in England, got up by a London Society

(so called) against Cruelty to Animals. Doctors were hissed and hooted in meetings as "butchers," &c. A prize essay was instituted, obviously against vivisection, for which thirty-five essays were sent in; one-half, it is now stated, against vivisection, and one-half in favour of its cautious use, or its being left to the good sense of the profession itself. It was half proposed to prosecute men like Brown-Séguard, if direct cruelty could be proved. Signor Gavazzi and such men howled and hissed at him and the "doctors" in long speeches. But the general result is curious. One prize of fifty guineas is adjudged to a horse-doctor who proposed to suppress all vivisection, and an extra prize to Dr. Markham of the *Association Journal*, for his Essay in the same direction, curiously enough Professor Owen favouring the horse-doctor view against men like Hughes Bennett, Bowman, Dr. Sharpey, &c. A humane idea was put forth in some essays to recommend chloroform to vivisectionists, but the *éclat* or splash made in the society required all cruelty and vivisectional doctors to be put down, and thus attract subscriptions from its old lady supporters. The profession has got "a slap in the face," and so the society thrives, and no one objects.—I am, Sir, your obedient servant,

KAPPA.

TREATMENT OF BURNS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Most modern pathologists agree in believing the true way of treating burns consists in preventing the contact of the air with the burned surface by some mechanical covering, so as to allow nature the necessary time to repair the loss; hence it is why so many still adhere to that dirty old way of treating burns by sprinkling flour.

That this is true most of us now believe, as it affords us a true and ready way for explaining the manner in which the old authors treated burns with such success, and this not only applies to burns but to ulcerated surfaces—protect them from the influence of the air and they will heal.

All the good derived from treating burns by "carron-oil," "citting batting," and such like, is readily explained.

Our proposition consists in treating burns by painting them with a solution (thick) of gum arabic mixed with a small proportion of gum glycerine—the glycerine to act medicinally by its soothing properties, and mechanically by preventing the gum from falling off in scales—the part burned to be painted with such a solution, and allowed to dry by exposure to the air; when dried we have an un-irritating artificial skin, transparent, which allows the surgeon to see nature making the necessary repair, without disturbing the dressing.

Theoretically our treatment holds good; but as we have had no opportunity of treating it practically, it remains to be proven by practice how far it will prove successful.

It is necessary the proportion of glycerine should be small, otherwise it would prevent the solution from drying.—I am, Sir, yours truly,

M. F. GAVIN, M.D., &c.

Gardiner-street, Dublin, August, 1866.

THE CASE OF DR. DWAIN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Unaware that any reply in the way of consolation or advice has been given by any of your correspondents to the very important letter of Dr. Dwaine, as published in your journal of the 22nd ult., I would suggest to that aggrieved gentleman, in the first place, that he should at once satisfy himself as to whether any Government official whatever has a legal power to compel a member of the medical profession to give professional evidence (as an expert) in a public court without a fee. I verily believe that no such power exists.

In the second place, it appears that even if dispensary

medical officers are to be brought under so despotic and unjust a rule, this gentleman enjoys the happy privilege of a freeman from such grinding oppression in not being a dispensary doctor. Verily there seems to be, nay there is in actual operation, a strong tendency to heap additional burdens and restrictions upon dispensary medical doctors.

A plan has just been put into operation for appointing the paid officers under railway directors to issue dispensary tickets, demanding the services of medical officers at their pleasure. Now it is well known that hitherto, indeed since the formation of railways, the station masters and officials upon the several lines of railway formed clubs for the purpose of securing medical aid when necessary, and were thus self-supporting! And such is yet the practice. Why then break down this very proper spirit of independence upon the one hand, whilst upon the other an act of unfairness and oppression is carried out towards an over-worked and under-paid class of our Most Gracious Majesty's subjects? It is a true sentiment, "that so long as wrong is passively endured, wrong will be actively inflicted." Would that medical men were united and firm in seeking redress of their wrongs, and assuredly they would not labour in vain. —I am, Sir, your obedient servant,

AN OLD DISPENSARY DOCTOR.

COUNTY AND CITY OF CORK MEDICAL PROTECTIVE ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your advertising columns of the 8th instant contain resolutions from this Society, to which the attention of the entire profession is called. No doubt all who love its honour and respectability will read them with much interest.

The accompanying creditable letter, written by a military medical gentleman, recently come to Cork, was the means by which the attention of the Association was called to this important trial.

[COPY.]

"1, Parkview-terrace, July 27, 1866.

"MY DEAR DR. ARMSTRONG,—I happened to be in court to-day when the case of Foley v. Poole was tried, an instance, as you are no doubt aware, of a pauper patient endeavouring to obtain damages from the medical officer of the Ardmon Dispensary for malpraxis and neglect! This attempt, I am happy to say, was a complete failure, and a verdict was given in favour of Dr. Poole without a witness being called for the defence, Judge Fitzgerald stating that Dr. Poole left the court without the slightest stain on his professional character. I had no idea that the practice so prevalent, I regret to say of late, in England, of endeavouring to extort money from practitioners in medicine and surgery for alleged malpraxis and neglect, had extended to Ireland.

"This gross, and fortunately unsuccessful, attempt has proved that we are liable to these unprincipled attacks here as well as elsewhere. I think that this is a case for the Cork Medical Protective Association to take cognizance of, and that we should meet at an early day for the purpose of expressing our sympathy for Dr. Poole under this unmerited attack on his professional character; and that the members of the profession, not only in Cork, but throughout Ireland, should, by subscription, endeavour to compensate him for the pecuniary loss necessarily sustained in conducting his successful defence. It appears to me that this is one of those cases which eminently deserve the sympathy and aid of every member of our profession. None of us know when our time for selection for these iniquitous persecutions—under the name of prosecutions—may occur; but by uniting now in defence of our outraged confreere, we take the most effectual means of deterring unprincipled adventurers

from initiating similar proceedings against members of our profession.

"I shall be happy to contribute a guinea to a fund for this purpose.—Believe me to remain, yours very sincerely,
"M. JOHNSTON."

It appears that this prosecution is but little known to the profession, and hence the reason why the subscription list is not yet filled up. Allow me to enclose a copy of the circular I have issued on the subject, and to commend it to the consideration of the profession.—I have the honour to remain, dear Sir, faithfully yours,

CHARLES ARMSTRONG.

Cork, August 18, 1866.

[CIRCULAR.]

COUNTY AND CITY OF CORK MEDICAL PROTECTIVE ASSOCIATION.

20, Patrick's-hill, Cork, August 4, 1866.

DEAR SIR,—At a special meeting held to-day, a subscription list was opened to defray the expenses incurred by Dr. Poole at the late action brought against him, resolutions in reference to which you will see published in all the local papers, the *Waterford Mail* and *THE MEDICAL PRESS AND CIRCULAR*, by this Association.

An early answer will oblige, yours faithfully,

CHARLES ARMSTRONG, Hon. Sec.

NAVAL MEDICAL WARRANT.

TO THE EDITOR OF THE ARMY AND NAVY GAZETTE.

SIR,—Will you allow me to state that the moderate views put forward by you in your leader on the 4th inst., on the demerits of the new Medical Warrant for the Navy, are well received by a large number of those most interested. Although much more can be said, yet you have struck at the main points affecting those who have gone through the heat of the day, and dissuading young officers from remaining in the service—viz., its poor prospects. I noticed that you, who see so clearly the main faults, have not expressed your views of the best and most just way of remedying them. If you wait for evidence you will not be displeased at receiving this letter from one who has served a long period. The Retirement regulation has deprived us of the right to retire after 25 years' service, which is held to be of such value that we have lately seen an officer decline his promotion rather than relinquish it. By the old scale those who retired after 25 years were entitled to 18s. 6d., per day, without regard to age or state of health. The new regulations set this aside by substituting that we shall have only five-fifths of actual daily rate of pay, or from 12s. to 13s. 6d. a day on retiring with less than 25 years' service; and 20s. a day, after 25 years' service, when 60 years of age, or if in broken health. You have favoured us, Mr. Editor, with what you regard as the just feeling of the Navy on these hard terms in exchange for the optional boon of retirement at 20 years' service. I do not believe that the feeling of the Army will be so mild if the same regulations be enforced on it, as the sacrifice of rights secured in the Warrant of October, 1858, will be greater. I may state my conviction that naval medical officers will not be satisfied with a lower scale than this:—Optional retirement at 20 years' service on 16s. 6d.; do. at 25 years' service on 18s. 6d.; compulsory retirement at the age of 60 years on 21s. With regard to the scale of allowances it may be safely asserted, without risk of contradiction, that naval officers serving on their daily rate of pay are entitled to rations, mess, servants, fuel and light, and above a certain rank, to a private servant, as part of their emoluments. This rule is fixed as far as relates to executive officers, and the medical officers claim no more than this for themselves. The unfair system retained for the latter is an injurious relic of by-gone days, when hospital appointments were paid at a 50 per cent. higher rate than those in ships of war; but now that medical officers get the same daily pay everywhere, they

are not content to be without a due compensation for the allowances of a ship when they are serving ashore. As you have amply shown, this is not duly met by the new Warrant. This grievance would be redressed by rescinding the 4th Regulation altogether, and including in Regulation 5 "Hospital allowances in lieu of provisions for themselves and servants, for the pay of servants, and for fuel and light, according to their relative rank with other naval officers;" or by altering Regulation 4 in such a manner that £30 per annum being the minimum allowance for those who live at the mess for them, there shall be a well proportioned increase according to relative rank for those who are called on to maintain distinct households, and, are entitled to a private servant when serving in a ship. Accepting with you, these as the main points at issue, there are doubtless others of importance, but as they interest but few of us comparatively, I shall not allude to them in this letter in support of the views you have already published.—With sincere thanks, I subscribe myself,
A SURGEON IN THE NAVY.

It is useless to shirk the question. The Navy must be provided with a supply of medical men. When we say supply it is well understood by the expression we mean the infusion into the ranks of the surgeons of her Majesty's Naval service of highly educated professional men. The circular which was lately issued, and from which so much was justly expected, has produced nothing. We are told that we must be patient, and wait for the opening of the schools, when it is supposed the professors will recommend their hearers to join the Navy. We have no faith in this statement, which can only have its origin in hearsay. Some of the clauses contained in the circular have been received with satisfaction, while others have been loudly and universally condemned. It is contended that it would not only be popular, but fair, that the pay of the medical officers generally should increase by periods of four years instead of by five, as at present arranged, that the allowances for servants are ridiculously low, that these should be computed according to regulations prevailing in the Navy, without reference to those existing in the Army, and should be calculated according to the relative rank of officers wherever they may be serving. This should be no difficulty. *It is also considered just that Naval medical officers should be allowed to retire after a service of twenty years on the half pay acquired by such service, and that staff-surgeons should be permitted to retire after twenty-five years' service on £1 a day; and when they are compulsorily retired at sixty years of age, after completing a service of twenty-five years, they should be awarded £1 2s. 6d. a day.* In reference to the inspectorial grades, it is contended that when compulsorily retired at sixty five years the members should have an advanced rate of pay beyond that provided in the present half-pay scale. The present Lords of the Admiralty are not responsible for the provisions of the circular; and as some have been proved to them to be unsatisfactory, it is hoped that no time will be lost in making such improvements as the demands appear to require.—*Army and Navy Gazette.*

[From the *United Service Gazette.*]

Army Surgeons, can this be true?

MR. EDITOR,—Will you or some of your numerous readers kindly inform me if it can be true that in the Gazette of 22nd March, the surgeon of a regiment lately returned from India, who wanted but ten days to complete twenty years' service, was placed on half-pay at the liberal (?) rate of pension of five shillings a day, and if so, what led to so extraordinary a proceeding?—I am, &c.,

ONE WHO THOUGHT OF MAKING HIS SON AN ARMY SURGEON.

MR. EDITOR,—In your impression of the 11th instant is a query from "One who thought of making his Son an Army Surgeon." In the Gazette of 30th of March he will find that two surgeons are placed on half-pay, one of whom has served more than nineteen years, the other over seventeen years, and for which they have each been granted the liberal allowance of five shillings a day—a rate of half-pay which it is no such extraordinary circumstance to give officers of the medical department, as your correspondent seems to think.—I am, &c.,
OFFICE CLERK.

Extract from *United Service Gazette* of August 18, 1866.

MR. EDITOR,—In reply to "One who thought of making his Son an Army Surgeon," permit me to inform him that he

mistakes the date of the Gazette referring to the surgeon. The Gazette was dated 30th March, and in it was placed on half-pay, at the rate of five shillings a day, a medical officer who wanted less than a month of completing twenty years' service, or of his promotion to the rank of surgeon major, when, by the late medical warrant, he ought to have been entitled to a rate of half-pay at sixteen shillings and sixpence a day.

I believe the circumstances under which he was placed on half-pay, were these:—About fifteen months prior to the date of the half-pay gazette, he was placed in arrest while serving in India, for some affront to his commanding officer, real or imaginary. A court of inquiry assembled to investigate the matter, but as there was no one present when the alleged affront took place, it was a case of one man's word against another. At any rate the medical officer alluded to, after some time was released from arrest, and returned to his duty, which, by the way, he did while under arrest, and continued to perform for some months after this circumstance occurred.

Now, as to the right or wrong of the case, I, of course, am ignorant; but this does seem strange to me, that the assertion of one man of superior rank, and that, too, not on oath, should cause such a grievous wrong to a man as that adverted to. Of this I am fully aware—there was never the least fault found with the manner in which the said medical officer performed his duty.—I am, Sir, &c.,

ONE WHO OFTEN HEARD THE MATTER CANVASSED.

P.S.—Under such circumstances as these I am not surprised at first-class or even third-class medical men being unwilling to enter the service. Depend on it a trivial increase of pay will never induce men to subject themselves to treatment like the foregoing.

PROGRESS OF THE CHOLERA.

THE report of the Registrar-General for the thirty-fourth week of the year, which ended on Saturday, the 25th of August, confirms the conclusions drawn by us in our last week's report, founded on the daily returns up to the same date. It is satisfactory to find a continued gradual subsidence of the epidemic in London. The whole mortality of London amounted in the week to 1477, being an excess over the estimated number of 173. More than the whole excess is due to cholera, which caused 265 deaths, besides which 129 were registered during the week as having died from diarrhœa. The following figures show the gradual rise and fall of the epidemic during the last six weeks:—

Cholera	346	904	1053	781	455	265
Diarrhœa	221	349	354	264	194	129

The distribution of the disease remains much the same as in the previous weeks. Out of the 265 deaths from cholera last week, 198 occurred in the east districts, 39 in the south, 13 in the central, 12 in the north, and 6 in the west, while the 129 deaths from diarrhœa were distributed as follows:—41 in the east, 39 in the south, 21 in the north, 13 in the central, and 15 in the west districts. The younger portion of the community continue to display the greatest mortality. No less than 230 persons, under 20 years of age, died from the epidemic, the numbers being 115 from cholera, and the same from diarrhœa. The annual rate of mortality during the week has been 25 per 1000 in London, as against 23 in Edinburgh, and 20 in Dublin.

Respecting the meteorological state of the week, we find the mean height of the barometer at the Royal Observatory Greenwich, to have been 29.773 in.; the mean temperature of the air 61.2 Fahr., which is 0.5 above the average of the same week during the last 50 years; the mean degree of humidity of the air 86. During the week the rain-fall was 0.32 in., and every day, except Thursday, the blue mist, to which Mr. Glaisher has drawn attention, was more or less dense.

The Registrar-General acknowledges the courtesy of the London Water Companies, who have furnished him with the average daily supply of water for the month of

July; 467,696 metric tons of water were supplied daily; or 1076 litres to each house, and 152 litres (=33·6 gallons) to each person. The analysis of the waters for August is by Professor Frankland, F.R.S., of the Royal College of Chemistry:—

COMPANIES.	Number of Houses supplied in July, 1866.	Average Daily Supply of Water, in Gallons, during the month of July, 1866. (See Note).	Solid Matter in 100,000 parts of the Waters.	Organic and other Volatile Matter included in Col. 4.	Amount of Oxygen required for oxidation of Organic Matter.	Total Hardness.*

Note.—The water includes the supply for manufactures and for various purposes other than domestic consumption. This return, as compared with that for the previous month, shows an increase of 2948 houses, and an increase of 6,365,826 gallons of water supplied daily.

The table may be read thus:—100,000 lb. of Chelsea water contained 24·89 lb. of solid matter, of which 1·29 lb. of organic and other volatile matters was driven off by incineration; 0·0344 lb. of oxygen was required to oxidize the organic matter in the said quantity of Chelsea water. Of the solid matter, 17·4 lb. were carbonate of lime, or its equivalent of hardening salts.*

The results are recorded in 100,000 parts. By moving the decimal point one place to the right, the above figures express in milligrams the quantities contained in one kilogram of the several waters.

The fourth column of this table contains the amount of solid matter left on evaporation and desiccation at 120 deg. C.—130 deg. C. (248 deg. F.—266 deg. F.) The whole of the waters were again, as in last month, free from turbidity when drawn from the companies' mains.

The daily London mortality from the epidemic, since our last table, has been as follows:—

	Deaths from Cholera.	Deaths from Diarrhoea.
August 25, Saturday,	36	22
„ 26 and 27, Sunday and Monday together	53	28
„ 28, Tuesday,	81	23
„ 29, Wednesday,	29	22
„ 30, Thursday,	29	16
„ 31, Friday,	not ascertained.	

We last week noticed a certain disposition of the disease to spread. It is gratifying however, to announce that the new places that have become infected are not numerous, indeed up to the close of the Registrar-General's returns there were none; but a day or two after, Plymouth was reported to have suffered from an outbreak of which further details will be seen below.

LIVERPOOL.—The new returns from this place show a decline of 15 in the total mortality of the week, which is, however, still 200 above the corrected average number of the cor-

* The degree of hardness hitherto employed by chemists is that first proposed by Dr. T. Clark—viz., one grain of carbonate of lime, or its equivalent of hardening salts, in one imperial gallon of water, or one part in 70,000. The degrees of hardness used in the above table are readily converted into Clark's degrees by multiplying by 7, and then moving the decimal point one place to the right.

† No return has been received from the South Essex Company for the month of July, the numbers inserted above for this company are the same as those returned for June, no alteration having occurred in the number of houses supplied, or in the average daily supply of water during the previous four months.

responding week of the ten years 1856-65. Out of a total of 503 deaths, 146 were referred to cholera, 69 to diarrhoea, 23 to scarlatina. During the past eight weeks the deaths from cholera in Liverpool have been respectively 4, 19, 45, 87, 101, 126, 157, and 146. The annual rate of mortality in this borough during the thirty-four weeks of the year has averaged no less than 43·4 per 1000, whereas in the 10 years, 1851-60, it did not exceed 30. The authorities have indeed a terrible stimulus to do their duty, and we should be glad to be more explicitly assured of their activity.

PLYMOUTH.—The first cases of decided cholera occurred on Sunday night and resulted in the deaths of Miss Haddy, the matron of the Female Home for Fallen Women in Hill-street, and of the laundress connected with that establishment. Some of the other inmates have been attacked, but hopes are entertained that they will recover. The disease is supposed to have been introduced, or its fatal effects accelerated, by an alteration on Saturday of the drainage of the locality which is in an imperfect state. With reference to the general condition of the town, it is due to the Sanitary Committee and the guardians of the poor to state that for a long period they have been endeavouring to promote cleanliness. Although possessed of an ample source for the supply of water to the town, the authorities are prevented from bringing that supply home, through the mistaken opposition of some of the inhabitants on the score of expense. Nearly £30,000 have been expended in pipes and reservoirs, and only £6000 more is required to make the system complete. The revenue from the water is nearly £6000 annually.

It is to be hoped that immediate measures under the new Sanitary Act will be taken to compel those reluctant to finish the works to abandon a senseless opposition to measures absolutely necessary for the welfare of the place. It is a matter of national concern, that Plymouth should not be permitted to become another centre of the disease.

Reviews.

THE RETROSPECT OF MEDICINE; being a Half-yearly Journal, containing a Retrospective View of every Discovery and Practical Improvement in the Medical Sciences. Edited by W. BRAITHWAITE, M.D., and JAMES BRAITHWAITE, M.D. Vol. liii. January to June, 1866. Pp. 420. London: Simpkin, Marshall, and Co.

This old established Retrospect fully maintains its character as a valuable chronicle of the medical sciences. The subjects, as usual, are arranged under the separate heads of practical medicine, surgery, and midwifery; and under the head of addenda, a number of topics are introduced which could not conveniently be included in the former part of the volume.

THE AUSTRALIAN MEDICAL JOURNAL. No 62. This number is a good specimen of what is done in our profession at the antipodes. Mr. De La Roche Bragge gives an article entitled "Some Statistics of Midwifery in Private Practice." Mr. A. T. Gunning has a paper written on a case of Pneumonia and Empyema of the right side, with Bronchitis and partial Pneumonia of the left side; and Dr. Samuel Cusack, formerly Surgeon to Stevens' Hospital, contributes "Notes of some of the cases treated in the Colonial Hospital, Nelson, New Zealand, during the year 1865."

AN APPEAL ON BEHALF OF THE IDIOTIC AND IMBECILE CHILDREN OF IRELAND. By GEORGE H. KIDD, M.D., &c. Second Edition. Dublin. 1866.

In a former number of this Journal we particularly noticed the first edition of Dr. Kidd's valuable pamphlet; and some

time afterwards, in commenting on the proposed institution, the claims of which it advocates, we expressed a hope that the tractate, then out of print, would soon appear in the form of another edition. We are glad to say that our wish has been realized. The present edition is an obvious improvement on its predecessor, though, at the time, the former edition contained a summary of all known information on the subject. This edition is *distributed* by the Committee of which Dr. Kidd is one of the Honorary Secretaries.

CLINICAL LECTURES ON DISEASES OF THE HEART. Delivered at the Mater Misericordiae Hospital, by DR. THOMAS HAYDEN, Physician to the Hospital, &c.

THESE Lectures were originally given in our columns in July last; and they are now issued in a separate form. There is no more sound Hospital Physician and industrious follower of our profession than Dr. Hayden, as our pages frequently testify. These lectures, it is needless to add, are well worth reading.

ON MIXED TYPES OF FEVER: in Relation to the question of the Identity or Non-Identity of Typhus and Typhoid Poisons. By HENRY KENNEDY, A.B., M.B., &c.

DR. KENNEDY'S position as Physician to the Cork-street Fever Hospital, and Physician in ordinary to Sir P. Dun's Hospital, gives him an undoubted status in publishing his views on the above important subject. It is well to say that his views are not those of Dr. Jenner and others; but they are stated with great moderation, and are well worthy of consideration. This pamphlet is a reprint of Dr. Kennedy's paper which originally appeared in this Journal in May last.

OBSERVATIONS ON THE MEDICINAL SPRINGS OF HARROGATE. By GEORGE KENNION, M.D., &c. London. 1866.

THIS little pamphlet of sixteen pages contains much useful information for medical men who may wish to advise patients in the choice of fashionable resorts for the cure or alleviation of disease.

MEMOIR CONCERNING THE ACIDULOUS, GASEOUS, BICARBONATED, SODAIC WATERS OF VALS (ARDECHE). By DR. TOURRETTE. Paris. 1866.

THIS pamphlet of twenty-two 8vo pages, contains a chemical analysis of the waters in question; and argues their usefulness in curing bilious gall stones, diabetes, vesical catarrh, chlorosis, and other affections. In diseases of the skin, these waters seem to have exercised a beneficial effect.

ON ATMOSPHERIC CONDITIONS INFLUENCING THE PREVALENCE OF TYPHUS FEVER. By THOMAS WRIGLEY GRINSHAW, A.B., M.B. &c., Dublin. 1866.

THIS pamphlet is a reprint of a paper which appeared in the *Dublin Quarterly Journal* for May in the present year. The author is Assistant-Physician to Cork-street Fever Hospital; and his calculations and deductions, we are bound to say, exhibit considerable ingenuity and study of his subject. We hope he will pursue this matter farther.

RINDERPEST, ITS PREVENTION AND CURE; and Gypsum as a Sanitary agent. By JOHN J. LUNDY, F.C.S., F.G.S., &c., Member of the Public Health Committee of the Town Council of Leith. 2nd Edition. Edinburgh. 1866.

THIS pamphlet is intended to prove the superior advantages of gypsum as a deodoriser. Happily the cases of rinderpest are becoming less every day; but nevertheless Mr. Lundy's pamphlet is a useful contribution to the literature of the subject.

FIFTH ANNUAL REPORT OF THE DISPENSARY FOR SKIN DISEASES. Glasgow. March, 1866.

THIS report, which is written by Dr. McCall Anderson, is a useful contribution to the Statistics of Dermatology. It is right to record our regret at the untimely decease of Dr. Anderson's coadjutor in the founding of this institution, Dr. A. B. Buchanan, who fell a victim to typhus fever during the past year. Since the establishment of this Dispensary, 5331 persons have received advice at it.

ON THE NON-IDENTITY OF THE PARASITES MET WITH IN FAVUS, TINEA TONSURANS, AND PITYRIASIS VERSICOLOR, &c. By DR. MCCALL ANDERSON, Physician to the Dispensary for Skin Diseases, &c., Glasgow. Glasgow. 1866. Pp. 20. 8vo.

THIS paper is reprinted from a recent number of the *British and Foreign Medico-Chirurgical Review*; and it is quite equal to Dr. McCall Anderson's well and favourably known repute as a dermatologist. Our space will not admit of any detailed notice of this paper. We may, however, observe that Dr. Anderson deduces important proofs in favour of the non-identity view, from the occurrence of Favus, Tinea Tonsurans, and Pityriasis Versicolor, amongst the lower animals, and their transmission from them to man. His views differ materially from those of another eminent Dermatologist, Dr. Tilbury Fox, who, like Dr. McCall Anderson, has been an industrious and successful student in this important field.

ON THE TREATMENT OF LUPUS. By J. L. MILTON, Surgeon to St. John's Hospital for Diseases of the Skin. London. 1866.

MR. MILTON is well known as the author of a recent work on "the Modern Treatment of some Diseases of the Skin;" and this pamphlet of twenty-seven 8vo pages may be read with much advantage to the practitioner who seeks for information as to the treatment of Lupus. Mr. Milton doubts the value of external applications, but at the same time he thinks "that the disease *may always be relieved, and generally, if not always, cured.*" He advocates the use of Fowler's solution as an alterative, on Mr. Hunt's plan, and of calomel as a purgative; and he does not believe in the efficacy of Donovan's solution. He gives eighteen cases in support of his views. The pamphlet is practical, and is calculated to prove useful.

ON THE APPLICATION OF DISINFECTANTS IN ARRESTING THE SPREAD OF THE CATTLE PLAGUE. By WILLIAM CROOKES, F.R.S.

As we have already noticed the experiments of Mr. Crookes in connexion with disinfectants, it is not necessary to enter into the above report any further than by giving a brief notice of its publication as a pamphlet.

From the loose manner in which the terms disinfectants, deodorizers, antiseptics, &c., have been applied, and the still more loose manner in which the preparations that come under those denominations have been employed in times past, much less benefit has accrued from their use than might have been expected. The present state of our information upon the subject may be gleaned from Mr. Crookes' report; and if no other purpose were served, it would afford a safe starting-point for further investigations in the same direction. The subject is of especial interest, irrespective of the pressing requirements arising from epidemics.

CAUSES OF DEATH.—More than half the deaths of every year in England are from one or other of ten causes: phthisis, bronchitis, pneumonia, heart disease, old age, convulsions, atrophy and debility, scarlatina, typhus, and diarrhoea. Of all these diseases, phthisis is the most extensively fatal. Half a million of persons die in England in a year.

THE LANCET SANITARY COMMISSION.

WHAT can be gleaned from the five columns of printed matter in the *Lancet*, grandiloquently headed "The *Lancet* Sanitary Commission," bearing principally on the influence of water in propagating cholera? Facts are wanting, but assumptions abound.

They open honestly, by stating—

"That it (cholera) should first appear about the ports of London was to be expected, though we know as yet of no proof of its direct importation by ships which have come in.

"By conveying organic particles from a cholera patient to another person, water is believed to excite cholera.

"From this possibility of the organic matter derived from human beings being capable of exciting in a person the disease of him they come from, they are to be looked upon with exceeding suspicion and dread.

"The surest way of determining the human or other origin of the organic matter found in a sample of water is to trace the history of the water."

The pith of the communication would be regarded by the generality of readers as the recommendation of Spencer's "magnetic carbide," "a form of magnetic oxide of iron prepared by him."

That percolated filth supplied to populous cities for drinking purposes is a frightful source of disease no sane medical man would think of questioning, although it is a very common occurrence for members of Boards of Health, Sanitary Committees, and Vestries to do so with the greatest possible assurance. Impure water, bad air, overcrowding, and a host of other depressing influences, are usually conjoined. They are perpetually in operation in our crowded cities, but cholera, and diseases of a similar type, only make their appearance occasionally, hence something more than bad water or any other impurity is necessary to originate and propagate them, and that cause must be sought for in a peculiar condition of atmosphere, which is no sooner changed than the disease is arrested, and that, as a general rule, takes place suddenly. Nevertheless, without the accidental concomitants which we possess the power of controlling, the atmospheric influence, whatever it be, has always shown itself powerless. Hence the enormous and terrible responsibility which rests on the Legislature, as well as on our local authorities, cannot be too energetically or too frequently expressed, so that inaction, so soon as the calamity has passed away, such as we have in times past been compelled to put up with, shall be rendered again impossible.

A CORK MEDICO-GUARDIAN.

ON the 29th ult., the above astute body proceeded to elect a male nurse. Dr. Wall, one of the Guardians who has often figured in our columns, objected *in toto* to the appointment of male nurses; but his objection having been overruled by the Board, the election proceeded as follows, according to the *Cork Herald* of the 30th ult. :—

The candidates for the office then came before the board. When the first applicant was introduced, Dr. Wall put some questions to him, and really his examination caused much amusement.

Dr. Wall.—Do you understand an enema?

The Applicant—Sir? (A laugh).

Dr. Wall—Do you know how to give an enema? The applicant appeared to be puzzled in an extreme degree by the interrogatory.

Dr. Wall—Do you know how to give an enema, sir?

The applicant—A lame man sir? (Great laughter).

A Guardian—Perhaps it is an enigma he means? (Renewed laughter).

Dr. Wall—Do you know how to give an injection? (Laughter).

The Applicant—Oh I do, sir.

Dr. Wall—Then how would you give it? (Oh, oh, and roars of laughter).

A Guardian—Could you give the Doctor one now? (Great laughter).

When the next candidate came in Dr. Wall seemed to inspect his outer man rather minutely.

Mr. Keller—Ask him, Doctor, could he give that thing (laughter)?

The third applicant was asked by the chairman if he had had any experience of hospitals?

The Applicant—No, your honour, but I was down in Spike this time back (great laughter).

The Chairman—What doing?

The Applicant—In the hospital your honour.

The candidate O'Neill was elected.

MEDICAL TRIALS.

MEDICAL FEES AND THE POOR-LAW BOARD.

A CASE of considerable importance to the medical profession, in regard to their contract fees as medical officers to parish unions, especially in cases of lunacy, has just been heard and decided upon at the Farnham County Court, Surrey, before H. J. Stonor, Esq., Judge. The case created considerable interest and excitement, inasmuch as it was calculated to establish a precedent for similar cases in future. The action was brought by Dr. Edward Powell, house-surgeon of the Farnham Union, who sought to recover from the Board of Guardians the sum of two guineas for certifying to the lunacy of two paupers, inmates of the workhouse, being two fees allowed for the same by the Poor-law Board, but which the Board of Guardians refused to pay, on the ground that the certificates were given by Dr. Powell in the performance of his ordinary duties, and without entailing any considerable inconvenience.

Dr. Powell conducted his own case, and Mr. W. Hollest, clerk to the guardians, appeared for the defendant.

The facts of the case, as detailed by Dr. Powell, were to the effect that on the 21st of August, 1865, he attended at the workhouse, before the chairman of the board, and in his presence, as a justice of the peace, certified to the lunacy of a pauper named Sarah Howell. In the month of the present year he also certified to the lunacy of a man named James Parritt, at the same place, and afterwards claimed the usual fee of one guinea in each case, to which in accordance with his contract with the board, he was entitled. The guardians, however, rejected the claim, and he subsequently communicated with the Poor-law Board, from whom he received a letter, withholding any opinion as to the justice of the claim, and at the same time authorising him, if so advised, to enforce the demand elsewhere.

Mr. Hollest, having again stated the grounds on which the guardians refused the claim, contended that if Dr. Powell had been specially summoned to the house, or had been put to any inconvenience, it would have altered the circumstances, but it was during his attendance at the house that the lunacy of the paupers was certified to. He also added that, according to the debts Act of 1859, the claim in regard to the first certificate was not recoverable, inasmuch as it was not made within six months after it was incurred. The Poor-law Board were at liberty to extend that period to a twelvemonth if they thought proper, but they had not done so in the present instance, and even if they had done so, the time would expire in the first instance in a few days.

His Honor stated that he took full cognizance of the

Act of Parliament, and considered that the onus rested on Dr. Powell to show that the claim was in accordance with his contract with the guardians, which had been abundantly proved. He therefore gave a verdict for the plaintiff, with expenses, in the second fee, and observed that in the event of the Poor-law Board giving Dr. Powell permission to proceed with the first, as it had now exceeded the limits of the Debts Act, he would hear it again.

There were other medical men in court, and the verdict was received with applause.

THE REV. DR. HAUGHTON ON THE TREATMENT OF CHOLERA.

TO THE EDITOR OF SAUNDERS'S NEWS-LETTER.

SIR,—Having recently availed myself of a favourable opportunity of examining the arrangements made in Liverpool for the treatment of cholera cases, and believing that some of them might be imitated with advantage in Dublin, I make no apology for bringing the results of my experience under the notice of your readers. My attention was called to the Liverpool system by Dr. Mapother, of whom I made inquiries as to the best methods of disinfection and protection of nurses and students in Sir P. Dun's Hospital. Mr. Graves, M.P., kindly gave me the necessary introduction to Dr. Trench, the well-known officer of health in Liverpool, who took much trouble and devoted some of his valuable time to enable me to see the cholera machinery at full work. The arrangements may be classed under the following heads:—

1. Cholera Dispensaries.
2. Cholera Hospitals.

1. CHOLERA DISPENSARIES.—As soon as cholera began to increase seriously in Liverpool it was found that the usual routine of the parish dispensaries was insufficient to meet the peculiar pressure caused by cases of diarrhoea and cholera.

Five cholera dispensaries were, therefore, opened in as many centres of choleraic disease, a shop with a back room, or other suitable place was rented, supplied with medicines, and worked by the following staff, the arrangements of which are the result of much thought and experience, and well worthy of imitation.

There are seven medical officers attached to each dispensary. Three of these are on duty in the dispensary and employed in re-visiting old cases for eight hours a day. This medical watch is changed at midnight, at eight in the morning, and at four in the afternoon; the remaining four medical officers are on duty for four hours each, and relieve watch at eight a.m., noon, four p.m., and eight p.m., leaving the eight hours from midnight to eight a.m. uncovered. The duty of these four officers consists in outdoor visits to new cases, which they are bound to treat immediately in their own houses, or to have them carried to the nearest cholera hospital. The eight hours not covered by these officers form the first watch of the dispensary officers, whose duty it is, during those hours only, to attend to new cases of cholera as well as old ones.

The medical officers on duty for four hours each day receive half a guinea per day, and the officers on duty for eight hours receive £5 a-week.

The amount of good done by these special cholera dispensaries may be estimated by the fact that at the time of my visit to two of them in the afternoon, between 130 and 150 applications for aid had occurred from the preceding midnight; the great majority of these suffered from premonitory symptoms only.

I was assured by the medical authorities, and by the poor sufferers themselves, that the immediate effect of opening the temporary cholera dispensaries was to allay panic, to draw out the gratitude of the poor, and to restore their trust in the goodness of God. I perceive with much pain that a large number of the applicants were fellow-countrymen.

2. CHOLERA HOSPITALS.—It is a recognised rule in the treatment of cholera that if the patient is moved a long distance to an hospital he will die. In Dublin we have ten hospitals professing to teach students of medicine all that they ought to know and learn of hospital work. These hospitals are scattered pretty uniformly over the surface of the city, and when they are all thrown open to cholera cases, as no doubt they must be, out of regard to the medical class, if not out of charity to Cairns's poor, they will prove sufficient for the treatment of cholera, without the erection of special cholera sheds.

In Liverpool, however, the hospitals are not so numerous nor so conveniently placed as in Dublin, and it was therefore found necessary to erect cholera sheds. I visited in detail the "Helvetia" Hospital, and was greatly pleased with its admirable arrangements for ventilation, heating by open fires, cooking, and nursing. The nurses are trained in the institution for which Liverpool is famous, and receive payment from 10s. to 20s. a week. I found them brave, clean, prompt, and diligent, and they are under the orders of a medical officer of much experience of cholera in India, who took much trouble to explain to me the details of the hospital and his mode of treatment.

The cases of cholera in this hospital were of the same type as those

in Sir P. Dun's and in the Meath Hospital, and the medical officers complained of the advanced stage of the disease at which some of the cases were admitted.

In order to encourage the poor to use the cholera hospital, their friends are allowed under certain restrictions to see them. This rule, if not abused, seems to be a good one, as it cheers the sick. I saw one poor Irish girl holding her sister's hand during the agony of cramp, who suddenly burst into tears, when the sufferer called out, "Mother! mother, dear?" They were orphans, for their mother had died a few hours before, and as consciousness slowly returned, the poor patient recognised her sister's face, and clasped more closely her friendly hand.

Apologising for the length of this letter, which can be justified only by the importance of the subject, I am, sir, your obedient servant,
Liverpool, August 30, 1866.

SAMUEL HAUGHTON.

DEBATE ON THE PUBLIC HEALTH BILL.

THERE was a great opening for *Punch* "Essence of Parliament" in the debates on the Public Health Bill on the 30th ult. The science of our legislators shone out vigorously.

Mr. Ayrton had seen a scientific treatise attributing to coal-smoke a healthful influence; and the great freedom of Birmingham from cholera on a former occasion was stated to be owing to the coal-smoke. Why, therefore, should Parliament try to put down smoke?—Sir R. Peel believed that the absence of cholera from Birmingham arose from the superior drainage of that town.—Mr. Adderley suggested that in Bilston and other parts of the black country, where there was no deficiency of smoke, the ravages of cholera were more extensive than in any other part of the kingdom. Sir J. Jervoise thought the word "infection" ought to be defined. The medical officer, before surveying a house supposed to be infected, was recommended by the Privy Council to have a dress, consisting of "strong water-tight boots, reaching to the knees, and greased all over; a waterproof coat, closely buttoned up to the neck and at the wrists; and the head covered with a cap which takes the hair well in." He hoped the medical officer would be clothed in this safety dress before he embarked in the dreadful danger of visiting these nuisances, especially as he had to report to the nuisance authority; or, going into these pesthouses, he would himself come out pestiferous. The Emperor of the French had been visiting the cholera hospitals in Paris. There was also the experiment of a young student, named Jerard, who, to show that cholera was not infectious, took the perspiration off the forehead of a dying man and the fur off his tongue, and put them in his own mouth. A Commission on the yellow fever at Bermuda reported that it was not infectious.—Mr. Bruce would not argue whether cholera was or was not infectious. He presumed it would not be denied that there were diseases which were infectious.—Mr. Henley said the House ought to be informed what disinfecting meant.—Mr. Bruce replied that the process was well known at the hospitals.—Sir J. Jervoise observed that a work recently published stated that one of the methods employed made matters worse than they were before.—Mr. Henley asked what precautions were to be taken against spreading an infectious disorder.—Sir J. Jervoise referred to a statement of the medical officer of the Privy Council, to the effect that medical men were constantly conveying scarlet fever to their own children; and that being so, it was plain that they did it without proper precaution and wilfully, and, consequently, ought to be convicted.—Mr. Bruce observed that there was no doubt of the truth of the remark of the hon. baronet; and even when medical men had changed their clothes and washed themselves after visiting a patient afflicted with an infectious disease, they had been the means of conveying that disease to others. Sir J. Jervoise said that the country practitioner would have to take a whole wardrobe about the country with him.

HOSPITAL FOR WOMEN, SOHO-SQUARE.—The following gentlemen have been appointed by the Committee Vice-Presidents of this Hospital:—Sir William Ferguson, Bart., F.R.S.; Dr. Arthur Farre, F.R.S., and Dr. Jenner, F.R.S. Sir Charles Locock, Bart., F.R.S., has many years occupied a similar position.

Medical News.

UNIVERSITY OF LONDON.—The following are lists of candidates who have passed the respective examinations indicated:—

FIRST M.B. EXAMINATION.

ENTIRE.

First Division.

Anderson, Tompest, University College.
Cluff, James Stanton, B.A. Dubl., University College.
Loy, Thomas Richardson, University College.
May, Bennett, Sydenham College, Birmingham.
Ridge, John James, St. Thomas's Hospital.
Taylor, Frederick, Guy's Hospital.
Wagstaffe, William Warwick, B.A., St. Thomas's Hospital.

Second Division.

Addenbrooke, Edward Homfray, St. Bartholomew's Hospital.
Batt, Charles Dorrington, St. Bartholomew's Hospital.
Blackley, John Galley, Royal Manchester School of Medicine.
Crowfoot, Edward Bowles, St. Bartholomew's Hospital.
Fiddian, Alexander Paul, King's College.
Marshall, Henry Flamank, Sydenham College, Birmingham.
Nettleship, Edward, King's College.
Sanders, Richard Charles, London Hospital.
Willoughby, Edward Francis, University College.
Wyman, John Sanderson, Sydenham Col. and St. Bartholomew's.

EXCLUDING PHYSIOLOGY.

Second Division.

Heathcote, Rowland, Royal Manchester School of Medicine.
Hurlstone, Adam Payton, University College.
Lees, Joseph, St. Thomas's Hospital.
Soccombe, Edward Hepburne, King's College.
Yeo, Isaac Burney, King's College.

PHYSIOLOGY ONLY.

First Division.

Berridge, Edward William, St. Bartholomew's Hospital.
Bird, John Durham, Royal Manchester School of Medicine.
Raine, George Rolph, Guy's Hospital.

Second Division.

Bell, Cyril William Bowdler, B.Sc., Hull Medical School.
Dove, John Reuben Bathurst, London Hospital.
Eager, Reginald, Guy's Hospital.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—The first Class Examination of candidates for the licences in medicine and midwifery, was held on Friday, 31st August, commencing at three p.m. The examination was conducted under the supervision of the President of the College, and, at its conclusion, eleven gentlemen were admitted licentiates in medicine, and six licentiates in midwifery. Each candidate was examined separately by the examiners in turn; and we are informed on good authority, that the average answering was highly creditable. The examination was attended by several fellows and licentiates, besides the examiners of the college.

The following is a list of the successful Candidates:—

In Medicine.

John Guinness Beatty, L.R.C.S.I., 1886.
Despard Anderson, L.R.C.S.I., 1886.
Richard Brown Carey, L.R.C.S.I., 1886.
Dominic Lynch Olden, L.R.C.S.I., 1886.
Richard Joseph Ireland, L.R.C.S.I., 1886.
Fenwick Carre, L.R.C.S.I., 1886.
Anthony Lennon Brown, L.R.C.S.I., 1886.
James Ridley, L.R.C.S.I., 1886.
Daniel Herbert Bastable, L.R.C.S.I., 1884.
Michael A. Healy.
George F. Rougham, L.R.C.S.I., 1842.

In Midwifery.

John Guinness Beatty.
Despard Anderson.
Richard Brown Carey.
Dominic Lynch Olden.
Fenwick Carre.
Anthony Lennon Brown—all Licentiates of the College.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on August 23rd:—

Clothier, Henry, Haslemere.
Longbotham, George, Seaton Carew, Durham.

The following gentlemen passed their first examination on Aug. 16th:—

Cuff, John Stanton, University College.
Wills, Douglas, Guy's Hospital.

And the following on Aug. 23rd:—

Cortis, William R., Guy's Hospital.

At the competitive examination, on the 8th inst., for the prizes in Botany annually given by the Society of Apothe-

caries, the successful candidates were—James Ryall Rouch, St. Bartholomew's Hospital, gold medal; Marmaduke Alexander Lawson, King's College Hospital, silver medal and a book.

THE deaths from cholera in Berlin have been 3586 since the beginning of the epidemic.

SINCE the passing of the Cattle Act the number of cases per week has diminished from 15,000 to 160.

THE foundation stone of a new lunatic asylum for Newcastle-on-Tyne was laid a few days ago.

ACCORDING to official statements there still remain in the Prussian hospitals between 33,000 and 34,000 sick and wounded.

THE births in London last week were 2042 children. The deaths registered were 1477. The deaths in the present return exceed the estimated number by 173.

THE rate of mortality in Liverpool last week was 56 per 1000. According to the judicial statistics there are 3100 drunkards in this city.

ON Sunday week the Bishop of Chester again visited the cholera hospital at Liverpool, and preached twice, the collections at each being devoted to the relief of the sufferers.

AT the police courts several persons have been convicted under the provisions of the Sanitary Act for overcrowding lodging-houses.

A NOVEL cricket match has been played between the patients and staffs of the Laverstock and Fisherton Lunatic Asylums, at the Salisbury Cricket-ground.

THE sudden death is announced of Mr. Millard, a Poor-law Guardian of Lichfield, who died whilst proposing an increase of salary to one of the medical officers.

CHOLERA is abating in New York, but is raging fearfully through the west and south-west. The *Bavaria* has arrived out, and been placed in quarantine. She has had eight cholera cases and three deaths on board.

PROFESSOR SIMONDS, after examining a flock of sheep at North Walsham, Norfolk, states the disease to be not of the nature of the cattle plague, but to be one essentially affecting the pulmonary organs.

ON Thursday week a special report was presented at the Sessions House, Clerkenwell, from the committee of visitors of the County Lunatic Asylum at Colney Hatch, respecting the sewage of that establishment.

THE Bishop of London and Mrs. Tait lately visited the temporary hospital for cholera in St. Giles's, the Refuge in Newport-market, and other charitable institutions in the district.

ACCORDING to Professor Frankland's report the whole of the waters of the metropolis, supplied from the companies' mains in August, were again, as in last month, free from turbidity, when drawn.

IT is a curious fact reported from the South that the sudden transition from slavery to freedom, together with the sufferings of the negroes occasioned by the war, have filled the lunatic asylums to overflowing.

BARONESS SEYDLITZ, superintendent of one of the many companies of Prussian ladies who have formed themselves into charitable bands for nursing the wounded, is now, with her division of benefactresses, stationed in the hospital tents of Königinhop.

THE police have discovered in the Rue des Jardiniers a slaughter-house for horses, which daily sends its products to markets as beef. Two live horses were found on the premises. A journeyman butcher was arrested, and seals placed on the doors by the police.

ST. BARTHOLOMEW'S HOSPITAL, CHATHAM.—The Trustees of this ancient charity (founded A.D. 1078) have opened four wards, with twenty-four beds, for the treatment of ophthalmic cases. The care of these wards has been entrusted to Mr. J. Z. Laurence of London.

A KIND of rinderpest has broken out in Yorkshire amongst sheep and pigs.

Notices to Correspondents.

The Hospital for Women.—The notice is received.
 Dr. Alexander Lane, R.N., has written us a letter on "Fever," and states that he has found two most powerful medicines for the cure of this disease, but he has not stated what the medicines are. Perhaps he will be good enough to supply the omission.
 R. S.—The subject shall receive attention.
 Dr. J.—There is no institution of the kind, so far as we are aware.
A Pupil.—The question is one that may be answered by referring to any elementary book on "Chemistry."

American books and papers frequently come to hand with heavy postal charges on them, making it impossible for us to receive them. The senders of such books and papers are requested to have the entire postage prepaid.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—If it is not imposing too much on your time, I will feel obliged by your giving your opinion on the following subject:—A dispensary patient of mine, a widow, aged 40, enjoying very good health, has got narrowing of the lachrymal duct of the left eye, which seems to annoy her very much. I have probed it twice at intervals of three months with only temporary relief; which would you recommend, continuous probing, say once a week, or leaving it alone for five or six months to see the result?—I am, Sir, your obedient servant,

Cork, August 29, 1866. A DISPENSARY DOCTOR.

[We hope to answer this in our next.—Ed.]

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—To whom should I apply to know the qualifications necessary for admission to examination for an Assistant-Surgency in the Army? Where can a medical student's Guide be procured?—Yours, &c.,

INQUIRER.

[To the Director-General, in Whitehall. The Students' Number will appear on the 19th.—Ed.]

A SUBSCRIBER TO THE MEDICAL PRESS AND CIRCULAR would feel obliged if the Editor will have the kindness to inform him in next number if he could obtain an appointment in the Irish Constabulary for his son, aged 17 years, and how long he would have to remain as a Cadet at the Phoenix-park, Dublin, and what pay he would get while there, and if the appointment rests with Lord Naas? Or if his Lordship could obtain an appointment either at home or abroad for a medical man with a large family and only small income? Or if the Editor could inform the writer through what medium he could obtain a private patient to reside in his house in the neighbourhood of the Cumberland Lakes?

[A Subscriber had best ask the question of the Head of the Constabulary and of Lord Naas respectively: as to obtaining a patient, let him advertise in THE MEDICAL PRESS AND CIRCULAR.—Ed.]

THE ROTATORY FILLET.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In reply to numerous inquiries as to where the Rotatory Fillet is to be purchased, I beg to inform my professional brethren that in a week or two it will be advertised in the several medical journals.—I am, &c.,

G. R. SHERATON.

Appointments.

M. PHILIP SIMPSON, M.R.C.S.Eng., L.S.A., late Resident Medical Officer of the Westminster General Dispensary, has been elected Apothecary to the Colney Hatch Asylum.

E. C. SUMMERS, L.R.C.S.Ed., L.S.A., has been appointed Medical Officer to the Homerton District of the Hackney Union.

B. B. THURGAR, M.D., has been appointed Resident Obstetric Officer to St. Mary's Hospital, Paddington, vice N. B. Major, M.R.C.S.E., whose term of office has expired.

S. M. WARD, M.B., has been appointed Medical Officer for the Chobham District of the Chertsey Union, Surrey, vice J. Langdon, M.R.C.S.E., deceased.

W. WATKINS, J.P., M.R.C.S.E., L.S.A., has been appointed Resident Surgeon to the Lunatic Asylum and General Hospital, Berbice, British Guiana.

R. W. WILCOX, M.R.C.S.E., has been elected Medical Officer for District No. 5 of the Aylesbury Union, vice T. J. E. Brown, M.R.C.S.E., resigned.

W. PARRE, L.R.C.P.Ed., has been appointed Medical Inspector of Health for Willenhall, Staffordshire.

F. OPPERT, M.D., has been appointed Physician to the City Dispensary, Queen-street, Cheapside, vice G. O. Drewry, M.D., resigned.

J. A. HAYDEN, M.R.C.S.E., has been appointed Resident Medical Officer to the Charing-cross Hospital, vice J. G. MacKinlay, L.R.C.P.L., resigned.

A. JACKSON, M.R.C.S.E., has been appointed Surgeon to the Sheffield Public Hospital and Dispensary, vice S. Parker, M.R.C.S.E., resigned.

J. Z. LAURENCE, M.B., F.R.C.S., has been appointed Ophthalmic Surgeon to St. Bartholomew's Hospital, Chatham.

W. H. SPENCER, B.A., has been appointed Lecturer in Comparative Anatomy at the Charing-cross Hospital Medical College.

"QUASSIA THE QUACK."

Some sing of old Bacchus and his ruddy wine,
 Whilst others intone to a muse of the "nine;"
 But why should a bard tease his head with the pack,
 Whilst "gushing" for fame is bold Quassia the Quack?

Bold Quassia you'll find, in his "study" or "shop,"
 Dressed up as a "swell" and "deeked out" as a "top,"
 With rings, chains, and "choker" of clerical hue,
 And lingual "palaver" sufficient for two.

His boots vie in brightness with his "local" fame,
 His hat "wears a lustre" that puts both to shame,
 His "cane," silver mounted, with the "wealth" on his back,
 Give an air, quite *distingue*, to Quassia the Quack.

He "swells it" by physic, and "does it," too, well,
 And though people hint that "our hero" 's a "sell,"
 And whisper, "dear me, why permit vice such swing?"
 Bold Quassia is jolly, and "struts" like a king.

Oh! how he "sniffs" air, as he passes M.D.,
 How he blows and he bustles when "scenting" a fee,
 And his looks seem to utter "I'm on for a tack,"
 "So make way, your souls there, for Quassia the Quack."

He cares not for "Council," for "College," for "Hall,"
 With contempt *super-heated* he looks on them all,
 For his conscience is "cloudy" and diplomas his "brass,"
 Cunning fox, parrot-tongued, with the brains of an ass!

Quassia's "fee" is a shilling (I forgot, half-a-crown)*
 If he "calls in his carriage" (?) or a distance from town,
 And his "wheeler" is 'gloss'! and his "coachman" dressed pat,
 Can you doubt, sir, his buttons or "gold" on his hat?

Then here's to Bold Quassia, the "pride of our day,"
 And here's to the laws that give rascals such sway.
 But, ah! for a sapling ("nice and handy" to thwack),
 And the muscles to "try it" on Quassia the Quack.

* Of course "Quassia of the Square" never beheld coppers,
 Seldom "meddled" latterly with silver, gold is his fee!
 Charrington-street, August 19, 1866.

R. L. J.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

On the 14th ult., at Newcastle-on-Tyne, the wife of Dr. Ellis, of a son.
 On the 22nd ult., at the Royal Hospital, Greenwich, the wife of Dr. Smart, of a daughter.

On the 24th ult., at Calverley, near Leeds, the wife of Wm. Kitto Giddings, M.&L.M.R.C.S.E., of a son.

MARRIAGES.

On the 6th of June, at the residence of the bride's father, James Appleyard, M.R.C.S.E., L.S.A.L., of Mortlake, to Mary S., eldest daughter of John Macfarlane, J.P., Surgeon and Squatter, of Ee-Yenk, near Mortlake, Victoria, Australia.

On the 9th ult., Myrry Clarke, Esq., Surgeon, of Jamaica, to Margaret Ann, only daughter of Dr. Hawkins, of King's Lynn.

On the 15th ult., at Blendworth Church, Hordean, Hants, Robert Liveing, M.D., Assistant-Physician to the Middlesex Hospital, youngest son of the late Edward Liveing, Esq., Surgeon, of Nayland, Suffolk, to Adelaide Mary Dorothea, youngest daughter of the late Admiral Hawker, of Ashford Lodge, Petersfield, Hants.

On the 22nd ult., at St. John Church, Holmfirth, Christopher B. N. Dunn, Esq., Surgeon, of Crich, Derbyshire, to Ellen, fourth daughter of Edw. Trotter, Esq., Surgeon, of Holmfirth.

On the 22nd ult., at Newcastle-on-Tyne, John Gregory White, M.D., of Woodstock, to Jane Emily, daughter of the late — Richardson, Esq., of South Ashfield, Newcastle-on-Tyne.

DEATHS.

On the 11th ult., after a week's illness, John Henry Steele Walker, Esq., of Holme, Westmoreland, aged 44.

On the 22nd ult., at Exeter, William Land, M.D., aged 77.

On the 26th ult., at Gloucester House, Ledbury, John Tanner, M.D., aged 60.

BOOKS RECEIVED.

Sedgwick on Cholera. New Edition. London: Walton and Maberly. Annual Report of the Surgeon-General, United States Army. 1865.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

BRITISH MEDICAL ASSOCIATION.

So much of our space has been devoted to the full reports of the Addresses in Medicine and Surgery, that we can only afford room for a condensed account of the other proceedings of the Association. Of these we shall first give a report of the discussions on special subjects selected by the Council, and afterwards notice the more practical papers read at the meeting. The questions proposed by the Council were:—1. What is the influence of hospitals on the rate and mortality? 2. Are there any trustworthy facts as to the origin of pyæmia? 3. Is the expectant treatment to be relied upon in any form of acute disease?

I.

Dr. SIBSON and Mr. HOLMES undertook to open the discussion on the influence of hospitals. Dr. Sibson considered that residence in hospital largely reduced the mortality of all diseases, except pulmonary consumption, and in some cases even of that. He then devoted a considerable part of his contribution to the construction of hospitals.

Mr. HOLMES contended that the common opinion that hospitals increased the mortality of various diseases was quite erroneous. The discussion was not followed out for want of time, and the opinions of Dr. Sibson and Mr. Holmes seemed to have numerous adherents.

II.

PYÆMIA.

Mr. A. BAKER of Birmingham, opened the discussion on pyæmia, and carefully summed up the various opinions that have been advanced as to its pathology and treatment.

Professor BENNETT considered that the opinion that the disease originated through the presence of pus in the blood was no longer tenable. He considered that the varieties of the malady constituted distinct diseases, and he looked forward to advancement by the discovery of a more definite and sound pathology. He then placed before the meeting the facts that are known as separated from the theories which have been propounded.

Dr. STOKES said the so-called pyæmic state had been studied too exclusively in reference to injuries or operations; he thought non-traumatic cases should receive more attention. These were not uncommon in the Dublin hospitals. It was not produced by the air of the hospital, for cases were brought in labouring under it. In its most common form it was sometimes mistaken for rheumatic fever. It is to be distinguished by the typhoid character of the fever, the prostration, the state of the tongue, and the cerebral symptoms. The swelling was in the vicinity rather than in the cavity of the joints, and often attended by œdema. In many of the late Dr. McDowell's cases, related in the *Dublin Medical Journal*, purulent deposits were found in the serous membranes and the parenchyma of organs. The head of the tibia was often denuded of periosteum. He thought the disease should be classed with the pyrogenetic fevers—such as glanders and small-pox—the pus being a secondary product of a preceding morbid condition of body, in which the whole system becomes, as it were, a laboratory for the production of a special product.

Dr. RICHARDSON related his experiments on the synthesis of pyæmia, and described how the poison would be

obtained from the secretion of a wounded surface. He considered this poison to be an alkaloid, derived from albuminoid matter thrown out of the wound. He looked upon a certain meteorological condition of oxygen as the cause of the product being formed.

Mr. SPENCER WELLS did not agree with Professor Bennett that pus was never found in the blood. He had himself seen it.

Mr. NUNNELEY inquired whether the disease produced artificially from the poison could be propagated from the animal secondarily affected; further, could ordinary albumen be made to undergo changes that would render it a poison?

Dr. RICHARDSON replied in the affirmative to both these questions.

Mr. HENRY LEE said healthy pus could be injected without producing disease, but decomposition rendered the purulent matter poisonous.

Mr. MOORE defined the conditions included under the general term pyæmia.

Mr. HUTCHINSON held that the previous health of the individual had no relation to pyæmia; that the disease is not contagious; that it is most frequent after recent injuries involving bone; and that the external wound may appear healthy, and yet the disease be present.

Dr. EDWARDS had seen pyæmia after certain uterine diseases.

Mr. BAKER BROWN said it was not at all infrequent after division of the os and cervix. He had seen many such cases; but if great care was taken in plugging the cut surfaces with oiled lint, so as to exclude the air, it might be avoided. He considered that the poison was in these cases taken up by the veins. He spoke from the experience of hundreds of cases of operations on the female genitals.

Dr. DAY inquired if any one had seen pyæmia follow subcutaneous incisions, but received no reply.

Mr. BAKER thanked the Association for its reception of his paper, and expressed his satisfaction at the admirable discussion it had elicited.

III.

THE EXPECTANT METHOD.

Dr. PATRICK STEWART opened the discussion on whether the expectant treatment is to be relied upon in any form of acute disease. His conclusions would seem to be that the expectant method is inferior to a moderate resort to remedies.

Prof. BENNETT and Dr. RICHARDSON both took part in the brief discussion elicited by Dr. Stewart's paper.

Dr. RICHARDSON concluded that out of 278 diseases the expectant method could not be of service in more than about 32. He mentioned that Michael Albertus was the originator of the expectant treatment as well as the author of the dogmas *similia similibus curantur* and *contraria contrariis curantur*.

LOCAL ANÆSTHESIA.

Dr. RICHARDSON gave a practical demonstration of his method of producing local anæsthesia by means of the ether spray, with numerous directions for various operations. In his opinion the principle of *general* is identical with that of *local* anæsthesia. He explained that the difference is simply this, that in the one case (*general anæsthesia*) the brain is cut off from communication with the local part, while in the other the part is cut off from the brain.

Whatever the principle involved, the performance of the Cæsarian section without pain, which has now taken place three times by means of the spray, sufficiently establishes the value of Dr. Richardson's ingenious invention.

ACUTE RHEUMATISM.

Dr. BIRKBECK NEVINS advocated treatment by steam baths followed by cold affusion, even when the patient could not leave the bed, and quinine and iodide of potassium in combination, although febrile symptoms might

be present. Opium was scarcely necessary, and only in small doses. The benefits of this treatment were, early abatement of pain and perspiration, speedy recovery of strength, unusual absence of cardiac disease, and few relapses.

This paper called forth a useful discussion, in which

Dr. FALCONER gave his experience in eighteen cases, of which one only had ended fatally. Of these there had been one male and three females with heart disease. In all the cases the patients had been put into blankets. Where there was heart disease cotton wool was used, and belladonna exhibited. He had never used a blister. He combined iron with alkaline treatment; used a bath at the commencement, and injections of quinine and iron afterwards. He considered the temperature of rheumatism $103^{\circ}6$. When it reached 104° , some complication impended.

Dr. STEWART thought the blanket a most important auxiliary. It prevented chill. The patient should remain in bed and the bowels be kept open. He was convinced that chill was the chief cause of complications. He rarely found the temperature exceed 102° . He had used the alkaline treatment largely, and had not found it prevent heart complications.

Dr. MARKHAM thought much mischief had arisen from the indiscriminate praise of alkalies. It had been forgotten that Dr. Dickenson's cases were selected ones, which had no heart affection when admitted; but the absence of cardiac complication was a proof that the cases were not serious.

Prof. BENNETT had asked himself how long does rheumatism take to get well of itself? Until that question was answered, they could not determine what to do. Who could venture to say this or that treatment was successful if he did not know how long the disease would be likely to last if left alone? He had tried everything, and he found all drugs much alike. He then tried nothing, and the result was much the same. His view was, that acute rheumatism got well of itself.

Dr. DAY considered no remedy so useful as alkalies. In his hands blisters had also been very efficacious. It had been found in America that where there had been rheumatism in a limb there was often a nervous affection afterwards. Consequently spinal treatment was adopted with success.

Mr. SAMUEL HEY found that a blister wherever applied diminished the acute symptoms. It appeared to him to eliminate the poisonous matter more effectually than anything else.

Dr. NEVINS, in reply, said the point to which he wished to direct attention had not been touched in the discussion. That point was the early employment of steam-baths while in bed, and the combination of iodine with quinine. He had seen very little heart disease since he had been pursuing this practice. He had not used blisters from a desire not to increase the patient's sufferings. He believed in the efficacy of cantharides internally, and had used tincture of cantharides, which he had found very valuable in chronic rheumatism.

THE LATENT HEAT OF ANIMAL BODIES.

Dr. RICHARDSON described some of his recent researches on the heat of fluidity of the tissues of the body. He had been led to these by observing that when a part of the body was frozen there was a rise of temperature at the moment of freezing. This indicated the evolution of a heat that was previously insensible, and led him to attempt to determine the latent heat of albumen, gelatine, blood, fat, brain-matter, and other structures. He considered the blood-corpuscles played an important part in the economy that had not yet been recognized. They were the bearers of heat, by rendering latent the heat liberated in the pulmonic circuit; then they conveyed it to the tissues, to be there delivered up in the process of condensation. Fatty matters acted in the same manner as heat bearers.

FEEDING BY THE VEINS.

From the views developed respecting the heat of fluidity, Dr. Richardson has promulgated a mode of feeding by injecting into the veins a nutrient fluid capable of conveying a large amount of latent heat into the circulation. He exhibited his instrument for the purpose, which is perfect of its kind, and there can scarcely be any doubt that amongst other venous injections proposed for cholera, the fluid suggested by Dr. Richardson will soon receive a fair trial at the hands of those engaged in the treatment of the epidemic.

USE OF THE ACTUAL CAUTERY IN OVARIOTOMY.

Mr. BAKER BROWN described the treatment of the pedicle of ovarian tumours by the actual cautery, a practice he had adopted in thirty-six cases. Three of these interesting cases were recently reported in the "Hospital Reports" of THE MEDICAL PRESS AND CIRCULAR, so that the subject will be fresh in the memory of our readers. Twenty-three of his cases, Mr. Brown said, had been given to the profession in two papers read before the Obstetrical Society; and the present paper detailed thirteen more. Of the whole number, five have died, but in not one of these had death resulted where the cautery had been used alone, with the exception of the second. In that case death was due to hæmorrhage from the site of an adhesion in the utero-rectal fold which could not safely be reached by the cautery. In the remaining four cases ligatures had been used in addition, in consequence of the cautery not having perfectly secured the pedicle. In these four, the causes of death were—1. Peritonitis with hypertrophy of the heart and thickening of the aortic valves. 3. Peritonitis (no post-mortem permitted). 4. General peritonitis. 5. Shock, a small quantity of coagulated blood on the stump. From his experience, Mr. Baker Brown drew this conclusion: it is preferable in all cases to employ the actual cautery. Should it from any cause fail to control all hæmorrhage, no harm has been done, and one or more ligatures may be then used without any disadvantage. The author exhibited the clamp he employs and explained the method of using it.

Mr. MEADE thought the originator of this plan might have taken his idea from the common operation of spaying pigs.

Mr. FOLKER had had a case of operation on the womb. Since then the patient had considerable weeping from the pedicle during menstruation, and this would be got rid of by this new method.

Mr. B. BROWE, in reply, said, Mr Meade was quite right as to the plan having been suggested by the mode of spaying sows, and he readily admitted his obligation to the practice of veterinary surgeons.

COMPOUND DISLOCATION OF ASTRAGALUS WITH REMOVAL OF THE BONES.

Mr. GRIFFITH of Wrexham read a paper relating three cases in which he had operated, and exhibited the bones to the members present.

REMOVAL OF THE ENTIRE TONGUE.

Mr. NUNNELEY of Leeds related a case in which he had performed this operation, and exhibited the tongue of the patient. He had employed the écraseur, and an interesting point was, that the patient had in a most remarkable degree recovered the power of speech.

REDUCTION OF LOCAL DISLOCATIONS.

This was another paper by Mr. Nunneley, who explained that dislocations of even an extreme degree could be reduced by manipulations without the forcible attempts so often made by surgeons. In these efforts chloroform was necessary.

Mr. NUNNELEY remarked, at the end of his paper, that in the *Transactions* of the Provincial Medical and Surgical Association twenty years ago he had related his experiments on anæsthetics. These had been made use of on the Continent without any acknowledgment. He

pointed out bromide of ethyle and chloride of olefant as anæsthetics which caused no convulsive movements, nor did they, he said, give rise to nausea or oppression. These statements were received with applause.

VACCINATION.

Mr. A. B. STEELE of Liverpool read an important and learned paper on the "Present State of Vaccination in England," demonstrating by tables the extent to which small-pox had decreased in those countries where vaccination had been made compulsory.

As to the aspect of this question in England he was a staunch advocate for compulsion. On the other hand, he was altogether opposed to the proposition that every medical man should be a public vaccinator.

MYOGRAPHY.

Dr. RUTHERFORD demonstrated experimentally the use of the myographion of Von Bezold.

ENDOSCOPY.

Mr. HEATH described the endoscope, and gave two demonstrations on the use of this instrument.

REMOVAL OF LACHRYMAL GLAND.

Mr. LAURENCE read a paper on "The Removal of the Lachrymal Gland for the Radical Cure of Inveterate Cases of Lachrymal Abscess," in which he described his mode of operating, and related eight cases in detail.

LOOSE CARTILAGES IN JOINTS.

Dr. DICK read a paper on "Loose Cartilages in the Articulations," and exhibited a new instrument he had designed for their removal. From a careful study of the subject, the author drew the following conclusions:—1. That in the present state of morbid physiology very little is known of the origin of loose cartilages in the joints. 2. That loose cartilages should only be removed by the subcutaneous method, and the most safe and easy way of removing them is by the subcutaneous scissors (these he exhibited.) 3. That when the loose cartilages are very small, say of the size of a lentil, the electric current through insect needles may be tried with advantage. 4. That open cuttings in the joints, as formerly practised, cannot be too strongly condemned.

CANCER.

Dr. BROADBENT read a paper "On a New Method of Treatment, by which Malignant Tumours may be removed with little Pain or Constitutional Disturbance." He stated that in 1864 he was consulted by a lady suffering from cancer of the breast. By his advice Mr. Walter Coulson removed the breast. The disease returned, and in August, 1865, was again removed. A tumour was growing more rapidly than ever in May of the present year, near the cicatrices of the former operations. It was decided that no further removal was advisable, and unless something could be done a miserable fate was before the patient. The author thought that by the hypodermic syringe, which is now in the hands of every physician, some fluid might be injected into the tumour, and so far alter its structure and modify its nutrition as to retard or arrest its growth. He selected acetic acid for the following reasons:—1. This acid does not coagulate albumen, and might, therefore, be expected to diffuse itself through the tumour, and the effects would not be localized at the point injected. 2. It could do no harm if it entered the circulation. 3. It dissolves the walls, and modifies the nuclei of cells on the microscopic slide, and might do so when the cells were *in situ*. 4. It had been advantageously applied to common ulcerations. The first injection was made on May 18th. The tumour was about the size of a small egg; a patch of skin, the size of a shilling, adhered to it. The needle was introduced through sound skin, an inch or more from the diseased part, and passed to the centre of the mass. Thirty minims of dilute acid were injected (one part of acid to one and a half, or two, of water. Little or no pain was felt. Next morning a bulla containing dark bloody fluid occupied the patch of

adherent skin. May 23rd: This portion of the skin was dry, hard, and horny, the adjacent part of the tumour not so hard. Another injection. June 7th: The piece of skin mentioned was found detached from the surrounding sound skin. A probe could be passed in all directions to a distance of three-quarters of an inch or more between the tumour and the healthy structures; a slight discharge from the fissure. Injection this day and again on the 9th, the acid rather stronger. It gave a little pain, and swelling and tension of the parts followed. On June 13th, and a few days after, there was a free discharge of fluid and solid portions, with relief of the swelling. No factor attended this discharge, which afterwards diminished. June 26th: On external examination the tumour was found much smaller, and a probe being passed into the opening, it entered a large cavity extending on all sides. Part of the walls seemed free from malignant structure, but at several points a crust of cancerous deposit remained. On attempting to inject, it was too thin to retain the fluid, which entered the tissues and gave great pain, or made its way into the cavity. This was stuffed with lint saturated with dilute acid, and the case left to the family medical attendant to inject as he saw opportunity. July 13th: No impression made on the remaining disease. Carbolic acid was tried, but discontinued, and the cavity dressed with strong acetic acid, and injections practised daily. This treatment gave much pain and excited inflammation all round. The patient was seen again by the author, August 4th, when there had been considerable hæmorrhage, which was arrested by free application of tincture of sesquichloride of iron. The result was apparently the entire removal of the remains of malignant disease. When last seen a healthy granulating surface was left at every point.

The author related three other cases, and drew certain conclusions from the experiments detailed. He referred to cases in which he considered the treatment was not applicable. He considered that large quantities of dilute acid were preferable to stronger acid. But he would not, without great hesitation, attempt the destruction of any tumour which had not involved the skin. Indeed his object, he said, had originally been, not necrosis of malignant tumours, but a modification in their nutrition. The ultimate value of the treatment he left to be decided by a more extended experience.

Mr. S. HEX felt the importance of any suggestions for the removal or palliation of cancer, and should be glad to put them in force. He thought some such method most likely to succeed, as the constant application of tincture of iron, so as to penetrate the surface, had been known to keep patients alive three or four years. Still, he should not hesitate the use the knife, if he could do it freely and properly.

Mr. T. H. SMITH said that cancer was constitutional, and must have its course constitutionally before it was developed in tumour. It was a question whether they had exhausted the means of detecting the cancerous constitutional tendency, and trying to attack it by remedial agencies. He believed it might be detected before local development took place. He had been trying the effect of arsenic in such cases for years. It was the best tonic he knew, and he had never seen any injurious effect from its use.

Dr. ANDREW referred to a case of lupus affecting the eye, in which he had been giving half a drachm of Fowler's solution for the last three months, and now it was almost cured. He had gone as far as thirty-five minims, and the patient had not been quite well under it, but there had been no irritation.

Dr. DAY read a paper "On Secondary Cancer" affecting the lungs, which created much interest. He based his remarks on two most interesting cases that had occurred under his care in the Stafford Infirmary. Both these cases terminated rapidly from the secondary disease after operation. The author appeared strongly inclined to believe that cancer of the lung was more frequently a sequence of

cancer of bone than of any other primary cancerous development. He reported experiments in which attempts were made to produce cancer by inoculation, and showed that these experiments gave no countenance to the supposition that the disease could be transmitted by inoculation. At the same time he thought cancer was really a local error of nutrition.

Dr. RICHARDSON said the idea that cancer in the lungs was preceded by cancer in bone was new to him, though certainly every case he had seen had been so preceded.

Mr. S. HEY referred to a large number of cases which corroborated the fact. In one case he had removed three parts of the scapula, with a large tumour, the patient being removed in four days, and afterwards dying of cancer in the lungs. He had never known but one case recover and remain well.

Professor STOKES had seen a good many cases of cancer in the lungs. He could not deny what had been said; but they should be cautious in assuming that cancer of the bone more than other forms of cancer invariably preceded cancer in the lungs. Certainly, there were other forms of local external cancer with a peculiar tendency to be followed after operation by cancer of the lung. He referred to several curious facts connected with the localization of cancer, and thought there were other examples of cancer in the lung independent of cancer in the bone. The rapidity of growth, he remarked, in isolated cancerous masses was very singular. He had seen a case in which, three days before death, two large tumours formed on the front of the abdomen; and during those three days they grew almost "under the eye."

Mr. MOORE thought secondary cancer of the lung was, on the whole, very rare; and when it did occur, it was almost solely in the case of medullary cancer, which might start from the testicle or the bone, or any part where the original tumour might have been. The lung was exempt from primary cancer as a rule, but he had seen it there. He was of opinion that cancer was inoculable from part to part of the same person, and referred to several cases which seem to corroborate that view. It was communicated by the constant pressure of the cancerous mass upon the healthy surface. The only difficulty was in passing it from one animal to another.

Dr. DAY said that his idea was, that the whole was not the result of what seemed to be considered cancerous diathesis, but simply an error of nutrition. Professor Stokes had misunderstood if he thought he meant to infer that cancer of the lungs was always preceded by a cancerous condition of the bone.

Professor STOKES had not thought so, but that Dr. Day thought cancer of the bone more likely to precede cancer of the lungs than any other form.

Dr. DAY did not feel himself in a position to answer Mr. Moore's suggestion about inoculation, as he had never himself made any experiments on that point. But there were some experiments recorded in the French *Gazette Medicale*, in which the experimenter had succeeded in inoculating some tumours, but had failed after cancer. He was not surprised at what Mr. Moore had described, but he did not think it proved that cancer could be inoculated.

THE CHOLERA.....In Berlin, the course of the epidemic has, since the end of last week, been more favourable from day to day. Up to the 24th July, the total of seizures has been 3701. From noon of that day to the 31st at noon, the number of fresh cases and of deaths were respectively—18,659; 203, 68; 172, 139; 84, 35; 131, 50. The grand total up to July 31st was as follows—4616 seizures, 2523 deaths, 590 recoveries, 1498 cases under treatment. At the four cholera hospitals, each of which is attended by a physician with two or three assistant-physicians, there were up to the 26th July received 1159 patients; of whom 300 were discharged cured, 614 died, and 245 remained under treatment. The spread of the disease over the various districts of the town, if the proportion of seizures to the number of inhabitants is taken into consideration, appears pretty equal.—*Deutsche Klinik*.

Original Communications.

ON CHOLERA AND ITS EARLY TREATMENT.

By G. K. HONEY PATERSON, L.R.C.P., L.R.C.S.Ed.

IN the treatment of cholera two points deserve our earnest and deep consideration—viz., either to administer means early for the purpose of neutralizing the cholera poison, or to sustain the powers of the human system timeously, so as to enable it to bear up against the disease while the treatment is being carried out towards a cure. Notwithstanding, there is an important question that must ever be well considered, as follows:—Ought we to obey the hint given by Nature? Her efforts is seemingly to throw off the poison from the human system. Nature's mode, by vomiting and purging to get rid of it, should be closely watched if possible. Consequently, skilfully to relieve and support Nature seems both reasonable and commendable. The patient's present condition should always be kept in view, and the earlier the better, from the fact that the tendency of the disease is, if not checked in time, to exhaust the individual affected. Heat externally as a remedy is of the first importance to be attended to early, and especially while the pulse remains pretty full and temperature of the body good, and the strength keeping up well, either in the form of hot bran or flannels wrung out of warm salted water, and applied repeatedly to the breast and sides of the body, also strong sinapisms of mustard to the pit of the stomach and region of the kidneys, and stimulating frictions with glycerine externally, so as to assist in keeping up the cutaneous circulation or to ease the cramps, as well as the proper and timely or early administration of twenty drops of tincture of opium and tincture of rhubarb in a little tea, every two or three hours, if necessary. A piece of common sulphur roll held in the patient's hands appears to give relief to the cramps. The restlessness of cholera patients is a great bar to their recovery, and the often getting up and out of bed very much adds to the coldness which the disease itself induces, and instead of lessening, it tends to increase the purging or motions of the bowels, and also leads to more weakness and often speedily prostration.

Let us do all we can to persuade cholera patients to keep themselves free of fear, and as quiet and warm in bed as possible, also with kindly and brave hearts and Divine assistance do whatever is found to be best for their relief and recovery in the hour of need, and hope for a blessing on our humble efforts.

Balbeggie, near Perth, August 7, 1866.

A THOUGHT ON ASIATIC CHOLERA.

By ROBERT TWISS,

MEDICAL OFFICER OF THE MOLAHIEFFE DISPENSARY DISTRICT.

ONE thing is proved, that it is a poison, and that the intestinal canal is the part of the human frame which it fixes on for its ravages. Now, there is another poison, a very active *stimulant* medicine (while that of cholera is sedative, if anything is so), and however used or applied by friction to any part of the body its action will be determined to the very same place, and this medicine is the corrosive muriate of mercury. Some of the greatest instances of the power of medicine I ever saw, or expect to see, were effected by it in mesenteric disease, which is also abdominal. From this extraordinary feature of both, and the known law of the animal economy to make one poison counteract another—as, for instance, vaccination preventing variola—I would recommend experiments with this medicine in cholera, as I will make, should it come round to me. I think it may be given in larger quantity without danger than is generally supposed. One scruple in three pints of mucilage (to defend the mucus membrane from its irritation, in the first instance), and a tablespoonful occasionally, according to the age of the patient, would be a fair way to begin.

REASONS FOR SUGGESTING CALABAR BEAN
IN THE
TREATMENT OF CHOLERA.

By E. D. MAPOTHER, M.D.,

SURGEON TO ST. VINCENT'S HOSPITAL, DUBLIN, ETC. ETC.

OF all diseases cholera is that in the treatment of which it is most justifiable to try agents either empirically, or because their physiological effects on man are opposite to those developed in that mysterious disease; for it must be confessed that we have as yet but little power over the disease, and of the scores of remedies proposed not one has ever obtained a high or uniform degree of success. This is especially true of the present outbreak in this city, which has been characterized by great virulence, absence of premonitory diarrhœa, and rapid supervention of algide collapse.

A few days ago it occurred to me that the state of collapse indicated a highly excited condition of the vaso-motor nervous system inducing spasm of the muscular tissue of the arteries, and consequent constriction of their calibre. As regards the pulmonary arteries this has been urged by Dr. G. Johnson, and even those whom he has failed to convince as to the eliminative method of treatment, allow that he has nearly proved such a spasmodic condition. When the vaso-motor apparatus of the head is stimulated in animals by galvanization of the superior cervical ganglion, or in a less degree by the administration of strychnia, the bloodvessels contract, and therefore the generation of heat decreases and the secretions are diminished, and owing to increased action of the radiating fibres of the iris the pupil dilates. The first three conditions are well known to be present in cholera collapse, and in many instances I have observed the last named. The paleness and sinking of the eyeballs which occur early in cholera indicate emptiness of the capillaries.

It is generally allowed that fear is a powerful predisposing cause of cholera, and on unimpeachable authority it has been alleged that the terror of the disease has proved fatal without possibility of exposure to its exciting cause. The well-known physiological conditions induced by fear—namely, pallor, by emptiness of the cutaneous capillaries, the erection of hairs, the quivering limbs, the weak voice, the sudden evacuation of fœces and urine, all seem readily explained by spasm of muscular tissue; but as the impression is clearly received through the mind, this spasm is more probably due to depressed action of the cerebro-spinal system, the then unbalanced ganglionic system coming into excessive action. The well-known condition termed "shock," whether produced by so profound a disease as peritonitis or by an extensive form, is very similar both to the collapse of fear and of cholera; the cerebral functions and the heart's action are not primarily affected, the latter fact being shown by the increased force and rapidity which bleeding will induce. The extremes of life, when the controlling power of the brain is less powerful, are peculiarly susceptible of this form of collapse as well as of functional nervous diseases. In all these instances the cerebral functions are intact, as they are in cholera, until the later stages, when the brain is poisoned by urea.

The changes which the body of the cholera patient undergoes after death also point to the inhibitory power which during life had been acting; for the blueness of the surface decreases and the temperature of the surface rises. The mode of inducing the condition of the nervous system opposite to that previously alluded to may be now described. When the vaso-motor apparatus is paralyzed by removal of the superior cervical ganglion the bloodvessels remarkably dilate, but without stagnation of their contents, for heat increases even to the amount of eleven degrees, and secretions are plentifully poured out; and, as noticed so long ago as 1727 by Pourfour du Petit, the pupil becomes extremely contracted.

If we possess an agent of well-ascertained power in

weakening or temporarily paralyzing the vaso-motor influence it is worthy of trial in cholera, and such Calabar bean seems to me.

Dr. T. R. Frazer (whose most admirable monograph will be found in the *Edinburgh Medical Journal*, 1863-4), M. Giraldès, and Professor Harley have demonstrated that this drug, (1) paralyzes striped and unstriped muscle, (2) causes dilatation of bloodvessels, (3) augments secretions, especially that of the mucous alimentary glands, (4) contracts the pupil, and (5) is physiologically antagonistic to strychnia. I have myself repeated many of Dr. Frazer's experiments with identical results. In large doses it kills by paralyzing the respiratory muscular tissue, but the heart is not primarily affected, that organ continuing to beat regularly even after the death of the animal for several minutes. If the drug acts on the sympathetic system alone its powerful effects are yet intelligible, for injury to the aortic plexus, as in Sir A. Cooper's first attempts to tie the aorta of lower animals, paralysis of the lower extremities followed.

Impressed with the likelihood of calabar bean acting usefully in cholera, I explained my views to Drs. Hudson and Lyons, who received them with very considerable favour. The latter physician has already treated some cases with this agent, and the former kindly permitted me to administer it to the patients whose cases are detailed below. I have also to tender my thanks to the resident officers of the Meath Hospital, especially Mr. Carter, who attended to the cases with great zeal. I may mention that I was determined to publish the cases, whatever the result—if positively successful much saving of life would follow, and, if the contrary, others might be warned from trusting to the same means.

1. Margaret Devine, aged 28, was seized with purging, vomiting, and cramps, about three o'clock p.m., on the 5th; she was treated with stimulants until ten o'clock on the 6th, when she was admitted into the Meath Hospital; purging and vomiting had ceased, but the cramps in the legs still distressed her. Neither the radial nor brachial arteries gave pulse, but in the common carotid it counted 92, and felt extremely feeble; the tongue, face, and extremities were very cold, and the surface was almost of a purple plum colour; voice was nearly inaudible; the pupils were fully dilated. Everyone anticipated death within a very few hours. The powdered bean was the only preparation then procurable, and of it three grains mixed in two drachms of water were administered every second hour. The only other treatment consisted in the application of external warmth; vomiting did not recur, nor did purging, but during several hours of the night blood was freely discharged from the bowels. The pupils contracted much after the third dose, and about the same time the coldness and blueness were much decreased. The carotid pulse did not alter in frequency or volume to any considerable extent throughout. At nine a.m. on the following morning she described a sensation of a lump in the stomach in terms very similar to those employed by Dr. Frazer, in describing his own symptoms after a full dose of Calabar bean; at ten o'clock the force and frequency of the circulation and respiration declined, and she sank shortly before midday.

The intestinal bleeding probably produced, or at least hastened death; and it may be questioned whether it was due to the very turgid state of the rectal veins, which is usual, or to the action of the drug, which is cathartic.

2. Michael Shelly, aged 50, was seized with purging and vomiting early on the morning of the 6th, in a room from which two of his children had been removed to hospital with severe cholera. I saw him there at eleven o'clock, when he had just passed a rice-water stool and was attacked with cramps in the forearms. There was no coldness or lividity of surface, but the eyeballs were much sunken, and his countenance was terror-stricken. The pupils were small, a condition which his trade, that of a tailor, may have made habitual. The administration of three-grain doses every second hour was commenced at one o'clock, when he arrived at the hospital; but at seven p.m.

a tincture made with five ounces of spirit to four ounces of the bean was procured and given in four-drop doses instead of the powder. The purging and vomiting ceased; he remained warm, suffered no cramps, and the pupils considerably contracted. He complained of a peculiar feeling of weight in the stomach, but nothing else, save very great weakness. He remained in this condition during Friday, but on Saturday morning, at nine o'clock, it was found that the rice-water purging and vomiting had returned, and his skin was sensibly colder. He was depressed extremely by the death of his child, which had just occurred in the next ward. As he had therefore got worse under full doses of the drug, I did not feel justified in continuing it, and small doses of calomel were prescribed, and as no urine was secreted, the loins were cupped twice, two ounces of blood being drawn the second time, and a bran-and-turpentine stupe was applied. At nine on Sunday morning he passed water freely, and may be now said to be rapidly recovering.

3. Patrick Gahan, aged 55, was seen by me at his residence at half-past nine o'clock on Friday morning, 7th. He had had rice-water purging and vomiting; was violently cramped in the legs; his face was pale, the eyeballs much sunken, pupils dilated, his hands and feet cold and bluish, and the radial artery was very thready. On his removal to hospital the tincture was given as in the preceding case, and external warmth was assiduously applied. Two stools were passed during the day, but the other symptoms gradually disappeared, and on Saturday he was almost fit to be discharged.

4. William Crutchfield, aged 15, at about four o'clock on Friday morning was severely purged and vomited, and fainted after one severe fit of purging. He was admitted at half-past twelve with these symptoms and with cramps, but no positive coldness or weakness of pulse.

The tincture was administered in the same way; the purging and vomiting gradually ceased, and he became warmer; the pupils fully contracted. On Saturday morning he was removed by his father, some prostration alone remaining. He has since remained quite well.

A fifth case was admitted in full collapse three hours since, and after the second dose considerable improvement was manifested, but the details must be reserved for a future report.

The above cases are too few for any positive conclusions to be drawn, but they are published in order that any physician who thinks that my reasons for suggesting the drug are sound may give it a trial on a larger scale. It may be better to administer the medicine by subcutaneous injection, as absorption is weakened, in larger doses than I have done, or combined with stimulants, anti-spasmodics, disinfectants, astringents, eliminants, or any other class of drugs which have been apparently useful.

I must add that I still regard the plan of Dr. G. Johnson as founded on truth, and the agent I have ventured to suggest is highly eliminative, especially by the alimentary glands. However, besides the removal of the morbid matter, it must be necessary to counteract the effects it has already produced, and if they consist in a spasmodic condition of the muscular tissue of the bloodvessels—and it seems to me there is no other way by which we can account for the intense and, in some cases, almost instantaneous collapse—the Calabar bean possesses antagonistic influence.

A REMARKABLE CASE OF GUNSHOT WOUND.

By J. M. LYNN, M.D., Armagh.

ON Wednesday, the 16th May last, I was hurriedly sent for to see a clerk in the office of a solicitor in this city. As the place was quite at hand I was there in a few moments, and on my arrival I found the apartment smelling strongly of burnt gunpowder, and sitting upon a chair, and leaning forward upon a table, on which was a quantity of writing materials, I found a young man, with a large lacerated gunshot wound in the back of the neck, out of which was welling arterial blood in large quantities.

On passing my finger into the wound, I found that the atlas was destroyed and the odontoid process of the second vertebra, also both internal carotid arteries cut across, and, of course, the spinal marrow completely divided.

The pulse in the radial artery could be felt for about three minutes after my arrival, and the heart continued to act for about two minutes more, but during all this time there was not the slightest effort or attempt at respiration.

The blood, which at first was florid, soon became dark coloured, owing to the suspension of respiration. In such a melancholy case medical aid was useless.

At an inquest held next day it was satisfactorily proved that the matter was purely accidental. A thoughtless servant took up a fowling-piece, and not knowing it was loaded, pulled the trigger, and the contents, a charge of small shot, passed like a large ball into the back of the neck of the poor clerk, who was busily engaged at his master's work.

NOTES OF A CASE OF

FACE PRESENTATION: CRANIOTOMY: DELIVERY.

By Dr. G. de GORREQUEB GRIFFITH,

PHYSICIAN TO THE HOSPITAL FOR WOMEN AND CHILDREN; PHYSICIAN-ACCOCHEUR TO ST. SAVIOUR'S MATERNITY; SOME TIME HOUSE-SURGEON TO THE HOME FOR DISEASES OF WOMEN.

WITHIN the last twelve months I have been called upon to perform craniotomy on two occasions. The first instance was that of a young patient, married only just nine months, in whom narrowing of the pelvis obtained to such an extent as to need this operation, and who had for two days previous to her delivery been the subject of convulsions. During those two days she had so many fits that the reckoning of them was lost.

There was some doubt in the minds of the two gentlemen who were in attendance upon her as to the presentation.

Without knowing of this doubt I examined, and decided that it was the head which first met the finger, or rather the tumefied scalp. I was then told of the doubt as to whether it was the head or the shoulder. I then examined again and confirmed my opinion, both as to the presentation and to the necessity of performing craniotomy. I also advised chloroform inhalation for the staying of the fits, besides other such collateral treatment as the case required.

I should mention that when I was called in in consultation, the woman was quite insensible, had been so for some time, and that uterine action seemed to have, in a great measure, ceased. Though this insensibility prevailed, yet any attempt at examination brought on the convulsions.

Having roused the flagging energies, I performed craniotomy—an operation rendered particularly difficult owing to the density and hardness of the foetal skull. The patient bore the chloroform admirably, but when the effects of it had passed away there was no return to consciousness, the insensibility continuing up to the second day after her delivery, when a fitful and passing gleam of reason and power of recognition broke upon her for a brief period. She could not, however, speak, and the entire of the right side was paralysed. She sank again into a state of insensibility, and died comatose.

No injury had been inflicted during the operation, nor was there any symptom during life indicative of such; all the fatal signs pointed to cephalic mischief, and disturbance of the entire nervous system.

The case to which I have alluded at the head of this paper is the one to which I wish to direct more particular attention, and is as follows:—

Mrs. W., aged about 45, mother of ten or twelve children by her first husband; had been a widow for nine years, and had then married her present husband by whom she was now pregnant. She is of the middle stature, fat, with broad hips, and good conformation; had never any difficulty in any of her previous confinements.

When I was called in there was almost no uterine

action, if indeed any; but I understood that there had been, all the previous day and night preceding. I attended at about nine p.m.

On examination with the hand on the abdomen I noticed that the womb and child were unusually high up. On introducing the finger into the vagina something was met which resembled the folds of the umbilical cord, especially when it is much swollen and enlarged; this "something" I traced up to the presenting part of the child, and, as I swept the finger round the presentation, I still entertained the idea that the cord had slipped down. More careful examination convinced me that what so closely resembled the funis, was nothing more than the lips of the os uteri very much lengthened, swollen, and edematous. They were so much elongated that they reached half way down the vagina; it was not a circular elongation, but an anterior and posterior, there being a prolongation of the anterior and posterior lips of the uterus, a distinct gap obtaining laterally.

Continuing my examination, my finger came upon the nostrils of the child; then, running it forward towards the pubis, I detected the mouth, and still more anteriorly, the chin, but resting above the pubis. Directing the finger backwards, the eyes and forehead were made out, the greater portion of the latter lying above the promontory of the sacrum, which projected so far forwards towards the pubis that it was impossible for the birth of a living child to take place. I had the patient put under chloroform, and then made the gentleman who had called me in to satisfy himself as to what I described. He did so, and we arrived at the one conclusion. I then, again, while the patient was under chloroform, proceeded to examine, this time using the left hand, prepared to enter the womb and turn the child if I found it practicable.

If no other obstacle than the projection of the sacral prominence opposed, my intention to turn this in itself was an insurmountable difficulty. With extreme care (having a very small hand and arm) I managed to insinuate the hand somewhat to one side of the promontory over the top of the child's head, under the occiput and down to the neck. Here I met the funis coiled round the child's neck; pulsation had ceased. Beyond this I could not pass the hand, partly owing to the greatly increased anterior convexity of the sacral angle, and partly because the womb tightly cinctured the lower part of the child's neck, and the upper part of the thorax. Before withdrawing the hand I lifted the occiput somewhat out of its bed above the promontory of the sacrum, and as much as I could rotated the face towards the left groin, and flexed the head a little on the neck so as to prepare a better position for the perforation. Having done this I left for an hour, and desired that the patient might be allowed to rest, and that she should be refreshed by nutriment and stimulants.

On my return after the lapse of an hour the patient was again put under chloroform. At the request of the gentleman in attendance I put on the long forceps laterally, but without any effect. Subsequently, I again got my left hand under the occiput, introducing it in the fashion I before mentioned, and flexing the head as much as possible on the chest, I proceeded to break up the head, the hand having previously been transferred from underneath the occiput, so that I might use the fingers as a guide for the perforator. I laboured under the disadvantage of having to perforate through the centre of the frontal bone where the gentleman in attendance had first pushed the scissors. This I found a very great inconvenience when I tried to use the hook, because the bones of the face did not afford a firm hold to the instrument, and the angle of the sacrum was so acute that it would not allow the hook to be directed backwards sufficiently to obtain a good purchase. I, therefore, first broke up one parietal bone, and then could manipulate with greater ease. It was not till the entire skull was completely broken up that the child could be drawn through the narrowed pelvis.

When the child was abstracted, and as there was no inclination on the part of the womb to expel the placenta,

I introduced the hand (left) and withdrew the after-birth. I then bound up the patient comfortably.

Some time has now elapsed since the operation, and there has been no untoward symptom. The patient has resumed her usual domestic duties and her position in society, having regained full health.

I would here note, as a singular coincidence, that about two years since this lady's eldest daughter was delivered in the same manner.

The cause of the face presentation can, I think, be explained in the following way:—When the uterine pains first commenced the child lay with the face either directly forwards towards the pubis, or turned a little towards either acetabulum, the occiput impinging on the sacral promontory, where it was arrested, steadied, and with each pain was forced against this unyielding angle; by degrees the uterine action—the *vis a tergo*—forcing the head downwards against the sacrum and pubis—the *vis a fronte*—the occiput was guided upwards by the higher ridge—the sacral promontory, while the forehead came down towards the lower ridge—the pubis. As the pains continued the head was completely flexed backwards so as to bring the occiput to rest upon the upper part of the back in the manner which obtained when I first saw the patient.

I apprehend that at one stage of the labour a brow presentation had taken place.

While upon this subject I would advert to a paper by Dr. O'Flynn, which you published in your number for August 8th, in order that I may take exception to some principles laid down in it. First, Dr. O'Flynn says, "It is in extracting the foetus after perforation that all our difficulties commence, and in performing this part of the operation an hour or more has frequently been spent in futile efforts at extraction, *while the woman, dispirited and exhausted, has to be plied with stimulants.*"

From the latter words (printed in italics) I gather that Dr. O'Flynn does not employ chloroform in such an operation. If he did the patient could not be "dispirited," or, indeed, know aught of suffering; and if he would adopt the plan mentioned in the body of my paper—namely, to give stimulants before employing the anæsthetic, he will find an immense advantage gained, inasmuch as he will be able to keep his patient for hours under the influence of the drug without there being any further necessity for administering stimulants, since the want of consciousness, the insensibility to pain, and the rest obtained by the chloroform, do away with the necessity of sleep.

I wish to take exception to this non-adoption of chloroform; because having studied under the great Irish masters of obstetrics—Churchill, McClintock, and Denham—I do not think the plan of not administering the drug is the practice in the Dublin school.

Not having by me the first volume of the "Obstetrical Transactions," I would ask Dr. O'Flynn to kindly tell me—Whether Dr. Mackenzie administered chloroform in the case "in which, after using the crotchet for two hours, he delivered by turning, and the woman died of shock?"

In applying the perforator—the forceps already embracing the head—I would ask Dr. O'Flynn, Whether he guided the point of the scissors with his fingers? And if not, what safeguard had he against the slipping of the instrument, and the injuring of the mother?

I presume, from Dr. O'Flynn's description of his case, that the deformity of the pelvis was in the antero posterior diameter. This would oblige him to apply the forceps laterally, and so to guide the scissors backwards or forwards. Then, when opening the blades of this latter, how, except by the fingers on the blades, could he know that the maternal structures were not endangered, the rectum posteriorly, the bladder in front. Should the perforator be inclined to either side—the forceps being on the head—and not be guided by the fingers, how terrible might be the consequences if the instrument slipped, because of the density of the cranial bones, an unguarded

thrust of the operator, or too great an amount of force in the boring movement, when the surgeon found that ossification of the head existed greater than he might have anticipated, or because of a sudden lurge or movement on the part of the patient, especially if she be not under the influence of chloroform. How terrible, I repeat, might be the consequences if the instrument slipped and perforated one of the contiguous bloodvessels, as it might do, did we not guard against such a contingency, by employing the fingers of the left hand.

Even when chloroform is given, we know that it is impossible to foresee that the patient will not move; but when she is not soporised, it is, indeed, difficult for her so to command herself as to ensure that there will be no movement.

Besides, if the head be not firmly locked or impacted in the pelvis, may not the child move or be moved by uterine action?

9, Lupus-street, London, S.W., August, 1866.

THE RINDERPEST OF THE PRESENT TIME,
AND
THE CATTLE PLAGUES OF PAST AGES,
IN THESE ISLANDS,
AND ON
THE CONTINENT.

By THOMAS MORE MADDEN, M.D., M.R.I.A.,

LICENTIATE OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND; MEMBER OF THE ROYAL COLLEGE OF SURGEONS, ENGLAND; LICENTIATE OF THE FACULTY OF PHYSICIANS AND SURGEONS, GLASGOW; DEMONSTRATOR OF ANATOMY, CARMICHAEL SCHOOL OF MEDICINE; AUTHOR OF "CHANGE OF CLIMATE IN PURSUIT OF HEALTH," "THE CLIMATE OF MALAGA," "OBSERVATIONS ON INSANITY AND CRIMINAL RESPONSIBILITY," ETC., ETC.

(Continued from page 64.)

PART III.

HISTORICAL NOTICE OF CATTLE PLAGUES IN IRELAND,
FROM THE EARLIEST AGES TO THE PRESENT TIME.

HAVING now placed before the reader as succinct a view of the nature and symptoms of the present rinderpest as the space at my disposal would allow of, I would invite attention to a branch of the inquiry which has attracted very little notice, notwithstanding its practical, as well as historic, importance—namely, the ancient cattle plagues of this country. The following account of these has occupied a considerable amount of time and involved some labour in searching through the ancient Irish annals and manuscripts, of which there are translated copies, in the library of the Royal Irish Academy. I have to return my best thanks to Mr. J. Long and Professor Connellan for some references, and in a special manner to Mr. William Hennessy for kindly furnishing me with several valuable notices on the subject from his forthcoming version of the "Chronicon Scotorum." In the Census Report of 1851, volume v., there is a great deal of most valuable matter on this subject, by Dr. (now Sir Wm.) Wilde, of which I should have availed myself more fully had I not had access to the sources of information I have just mentioned.

Concerning the earliest of the ancient Irish epizootics, we know comparatively little, excepting the period of their occurrence and the mortality they occasioned, these being generally the only points alluded to by our early annalists. Sometimes, however, the information goes beyond this; and we find the names of certain cattle plagues and the causes to which they were ascribed recorded. And in a few instances, as will be seen in the following pages, our ancient historians have left some account of the symptoms of these murrains, but in such vague and indistinct terms as to afford no clue to the character of the disease.

The names used by the Irish annalists do not help much to clear up our doubts as to the character of these cattle plagues. The expression most generally used in speaking of the earliest epidemics, in the "Annals of the Four

Masters," and of Ulster, is *Bo-ar*, and I am informed by two erudite Irish scholars—namely, Professor Connellan and Mr. Hennessy—that the exact meaning of this phrase is "cow-slaughter," which seems to me to convey a more graphic idea of the deadly character of the pestilence so designated, than the word "mortality," by which the word *Ar* is translated in the Census of 1851. The point is, however, of little importance.

The first epizootic in Ireland which I find mentioned in "The Annals of the Kingdom of Ireland," by the Four Masters, occurred in the year 5001 A.M., in which it is simply recorded, "There was a great mortality of kine in Breasall's reign." Dr. O'Donovan's note on this passage is, "From this mortality he (Breasall) received his cognomen of Bodhiobhadh." "Breasall Bodivo was king ten years. In his time there was such a morren of coves in this land as there were no more then left alive but one bull and one heifer in the whole kingdom, which bull and heifer lived in a place called Gleann-Sawasge"—*Annals of Clonmacnoise*. Dr. O'Donovan resumes, "Gleann Samhaisg, or Glen of the Heifer, is the name of a remarkable valley in the county of Kerry, where this tradition is still vividly remembered."—*Notes to Annals of the Four Masters*, vol. i., p. 86.

The probable date of the next epizootic alluded to by the early Irish writers may be fixed between the years 240 and 280. In a remarkable MS., in the collection of the Royal Irish Academy, is a translation by an eminent Irish scribe, Mr. Long, of a portion the "Book of Lismore," entitled "The Forbuis Dromdambgaire," in which I have discovered a curious confirmation of the importance then attached by the ancient Irish chieftains to the loss of their cattle from murrain. Concerning this manuscript, I may premise, on the authority of Mr. Long, that the scene is laid in the reign of King Cormac MacArt, circa, A.D. 281. It is an historical romance, apparently written in vindication of the claim of the Irish Druids to supernatural powers, written by an unknown author. One of the first events recorded in this MS. is the announcement of Aongus, who figures in nearly all our ancient documents as the most powerful of the Irish Druids, to King Cormac, that his misfortune will befall him, offering him, however, his choice as to what part of his reign it shall happen in. "Give it to me good in the beginning and the end," said Cormac; "and when my reign is best in the middle of my age, bring a reverse on my prosperity; and what shall it be?" said Cormac. "Nin," said Aongus; "a loss of cows that will occur in your time, until it be to the asking of one cow on the hills and rich pastures, and the seven Columhna of Tara, and in your own fortresses." Further on we read that the "cow-destruction" has come, and that King Cormac is obliged to distribute his tribute of cattle to his chieftains, "for they had lost their cows, and he kept back none without sharing." This romance which we need not follow farther here, goes on to narrate the results of this "cow-destruction," which gave rise to all the wonderful prodigies related in this most interesting manuscript.

Passing from these early traditions, we find that nearly three centuries elapse without any record of cattle plague in Ireland, till the year 561, when a murrain, which is said by Colgan to have occurred in Meath, is noted. Colgan says that it originated from a poisonous pool which made its appearance there that year—"Cisterna venenata per hiatum terræ apparuit in illa regione, et sumus de ea egrediebatur, qui mortiferam pestem hominibus et iumentis faciebat."—Colgan, *In Vita St. Aedi—Acta Sanctorum*, tome i., p. 422.

In the year 580 we read in Dr. O'Donovan's translation of the "Four Masters," that there occurred "a mortality upon all animals in general throughout the whole world for the space of three years, so that there escaped not one of the thousand of any kind of animals." "The year was so cold," the annalist goes on to say, "that the sea between Ireland and Scotland was frozen, so that there was a communication between them on the ice." Sir William Wilde quotes an account of a cattle plague im-

ported from England into this country from the "Annals of Clonmacnoise" in 695, which occasioned "such famine and scarcity in Ireland for three years together that men and women did eat one another for want." In the Chronicon Scotorum this "bovine mortality" is stated to have occurred in the year 696.

In 699 a similar disease broke out in Longford, and caused equal destruction and want. The only account of this epizootic is that given in the "Annales Ultonienses," which forms the fourth volume of O'Connor's "Rerum Hibernicarum Scriptores," in which under this year the entry is—"Accensa est bovina mortalitas in Hibernia in Kalendis Februarii in Campo Trego, i Tethbai." In the same annals in the year 700 we find a similar entry, and in 707, "Bovina strages iterum incendit." The next notice of a cattle plague in Ireland is in the following year, when we read (Ann. Ulton., p. 71, vol. iv.), "Pestis que dicitur Baccach, cum ventris profuvio, in Hibernia." This entry deserves special notice, as being the first account on record of the symptoms of these early cattle plagues in Ireland. The word *Baccach* signifying lameness in Irish, with diarrhœa (*ventris profuvio*). In 770 the Book of Clonmacnoise, already alluded to by Sir William Wilde, records "a great murrain of cattle called the *Matylegran* ran over the whole kingdom."

772. There is a similar entry.

775. Dysentery, or perhaps cholera, attacked human beings, and cattle plague the cows and oxen. ("Fluxus sanguinis morbi plurimi similiter. Pene mortalites in Bo-ar-mar. Boum strages magna."—*Annales Ultonienses*.)

The next mention of cattle plague contained in these early Irish annals is to be found in the Chronicon Scotorum in the years 916, 959, and 985, in which last year we find the first mention of the "Maelgarbh."

986. Pestilentia magna unde clades hominum et Armentorum inter Saxones, Britones et Hibernos (*Annales Ultonienses*). The same year, we read in the Four Masters, "Prenatural (*i.e.*, magical) sickness was brought on by demons in the West of Ireland, which caused great mortality of men plainly before men's eyes. The commencement of the great murrain of cows—*i.e.*, the strange Maelgarbh, which had never come before."

The same event is thus noticed in another contemporaneous chronicle:—"A.D. 981 (*recti* 986). This year began the murren of coves called in Ireland the Moylegarve."

In that year (we read in Short's "History of the Air") there was a deadly murrain in England.

1044. "Cluain-mic-Nois was plundered by the Con-mhaicni, and God and Ciaran wreaked great vengeance upon them for it—*i.e.*, an unknown plague (was sent among them), so that the Booleys were left waste with all their cattle, after the death of all the shepherd people."—*Annals of the Four Masters*, O'Donovan, vol. ii., p. 846.

1047. "A great snow this year, the like of which was never seen, from the festival of Mary until the festival of Patrick, so that it caused the destruction of cattle and wild animals, and the birds of the air, and the animals of the sea in general."—*Annals of the Four Masters*. In the succeeding year we read in contemporary chronicles that a great murrain had prevailed among the cattle in England.

1085. "There was destruction of men and cattle in this year to such an extent that certain rich people were made husbandmen in it."—*Annals of the Four Masters*.

1087. "Great abundance of nuts and fruit, murrain of cattle and dearth in this year, and a great wind which destroyed houses and churches."—*Four Masters*.

1115. "Boisterous weather; frost and snow from the fifteenth of the calends of January to the fifteenth of the calends of March, or longer, which caused great destruction of cattle, birds, and men; whence grew a great dearth throughout Ireland, and in Leinster particularly."—*Four Masters*.

1133. "A great murrain of cows in Ireland, which was called Maelgarbh, the likeness of which was not seen since the great cow mortality which happened in the time of

Faithbheartach, son of Loingseach, and it left but a small remnant of the cattle of Ireland."—*Four Masters*. This epidemic, as we learn from contemporaneous authorities appears to have lasted for three years, and was preceded by murrain in England.

1154. "There was a great destruction of thescattle of Ireland this year."—*Four Masters*.

1224. "A strange and awful shower fell in Connaught, extending over Hy Maine, Sodain, Hy Diarmada, and other parts, followed by terrible diseases and distempers among the cattle that grazed on the lands where this shower fell; and their milk produced in the persons who drank it extraordinary internal diseases."—*Annals of the Four Masters*, by Connellan.

(To be continued.)

Hospital Reports.

THE CHOLERA WARDS OF THE HOSPITALS OF LONDON.

LONDON HOSPITAL.

WE have again to report some diminution in the number of cases treated at this Hospital, as will be seen from our weekly summary.

Admissions into the Cholera Wards of the London Hospital during last Week.

	CHOLERA.		DIARRHŒA.	
	Males.	Females.	Males.	Females.
Aug. 31st	4	1	3	2
SEP. 1st	2	2	1	2
2nd and 3rd	3	0	2	3
4th	2	4	0	4
5th	0	0	1	3
6th	1	1	1	3
Totals	12	8	8	17

The case we mentioned last week, in which injection into the veins had been tried, unfortunately terminated fatally, but since then a further trial has been more encouraging. During the week 4 cases have been treated by the venous injections—the operation in each case being performed by Mr. Little. Of these two died on the third and fourth day after respectively. One which seemed the worst case is almost well; the fourth on the ninth day was well. This will serve to direct further attention to this important mode of treatment. Of course, in a disease of this nature, there is the difficulty of bringing all the statistics into certain fixed dates, as it is in the case of our hospital reports, necessary to send them to press as early as may be. We shall, however, not lose sight of the subject, and while reporting from week to week any salient features, hope, at a later date, to furnish our readers with a more comprehensive account of what has been done during the epidemic, of which we hope we have now seen the worst.

The new admissions reported above now bring the total cases treated at the London Hospital to—515 of cholera, and 209 diarrhœa, besides 10,043 minor cases treated as out-patients. The following is our table of results:—

	Total Admissions.	Recoveries.	Deaths.	Remain.
Cholera	515	196	272	47
Diarrhœa	209	153	17	39

LIMEHOUSE DISTRICT CHOLERA HOSPITAL.

It is satisfactory to report that here also there is a diminution in the number of cases, although not in the severity of the symptoms. Here also the venous injections have been tried. Two cases were thus treated, of which one is dead, but the other holds out a promise of success. Another mode of treatment considered successful is the exhibition of large doses of quinine—a fact we commend to those writers who have recently

insisted on the analogy between cholera and intermittent fever. Cases of cholera, accompanied or followed by scarlatina, variola, and varicella have also been admitted. These are also interesting from several points of view.

COMMERCIAL-STREET CHOLERA HOSPITAL.

THE chief object of establishing this hospital was to induce those suffering from the disease to leave their homes where they would be only likely to spread it to other members of their families, and it has been observed that where one patient enters another from the same house frequently follows. The hospital is placed under the care of Dr. Sutton, and the nursing department is carried on by the Plymouth Sisters, which Sisterhood has long been well known by the poor in the vicinity. Up to the present time 114 cases have been admitted, and there have been 33 deaths in the hospital. These numbers are to be qualified by the statement, that although some most virulent cases of cholera have been admitted, there have been many which, in classifying, would come under the denomination of choleraic diarrhoea.

The hospital contains three large, lightsome, well-ventilated wards, with lime-washed walls—one for males another for females, the third for convalescents. Each ward is placed in charge of a lady sister, with nurses and sisters under her, and the arrangements secure one nurse to every patient who is very ill. Many of the patients come from the poorer districts of Bethnal-green and Spitalfields, which have already suffered so much. The treatment adopted has at present been mostly hot applications, iced drinks, and other simple remedies.

BELLEISLE HOSPITAL SHIP.

THE method that has been adopted of sending all threatening cases to this ship from the *Dreadnought* has been attended with great success. A great number of cases of diarrhoea have been relieved, and there can be no doubt that numerous instances of incipient cholera have been arrested. It is to the excellent arrangements in connection with these two ships that much of the decrease of cholera on the Thames is to be attributed, for ships continue to come up the river with cases on board, without the slightest quarantine being enforced.

During the week 11 new cases have been admitted, and 3 deaths have taken place. This is certainly a relapse from the favourable accounts we were able to publish last week. On investigating the statistics it is found that about a quarter of the cases come from one locality—the Commercial Dock. This evidently points to some local cause giving rise to so many cases, and should at once be investigated by the authorities. While in other parts about the river there is a marked diminution, any judicious of local mischief ought to excite the suspicions and rouse the activity of those whose duty it is to enforce the local sanitary regulations. We noted last week the rapid convalescence of these who survive the stage of collapse at this hospital ship. Since then one patient has died from secondary fever—this being, however, only the second death from that cause. Whether the favourable and rapid convalescence so general here can be altogether due to the usually "iron constitutions" of our "tars" may be worth an attempt to determine.

Some details from other hospitals we defer until we can give a more elaborate summary of the epidemic, as witnessed in these institutions.

WAPPING CHOLERA HOSPITAL.

It has been stated that a considerable number of relapses had occurred at this hospital, but on investigation this appears to be an error. It is clear that no one has been discharged too soon; the authorities seem rather anxious to keep them till all danger is past, a very commendable practice.

Out of 172 patients admitted to September 7, one only

has been discharged. All the others who have left have left of their own accord; in the majority of cases after some delay caused by the express desire of those in charge.

There have been five cases of relapse:—

T. T., a baby, brought in with no urgent symptoms, taken away well, and three weeks later said to be dead from neglect. No application was made to any medical man till the very last.

M. D., a cholera case; first brought in drunk by the police; went out, returned, and left cured in 12 days.

J. D., cholera; left the hospital cured; brought in again after four days, having been drunk all that time; finally left cured in a fortnight.

A. S. diarrhoea and chronic drunkenness; left in three days, but returned; no urgent symptoms; was admitted and allowed to remain six days, when she tried to steal off with another patient's clothes. Having suffered from nothing but debility due to drunkenness, she was dismissed.

T. A., a baby, was taken away cured of diarrhoea; brought back again very fretful, but nothing the matter, and is still in the hospital.

The Reverend Mr. Burnaby says:—"With respect to the many seafaring people of the better class whose deaths have caused 'painful instances of bereavement,' there have been in all nine sailors admitted, men and boys; three have died; one left a widow, who has been provided with regular work in my parish as a mission woman; one left a widow and child in Norfolk; and one when brought in was so far gone that nothing could be learnt from him."

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS.

DR. LYONS'S CLINIQUE.

CHOLERA: ITS PATHOLOGICAL ANATOMY AND GENERAL PATHOLOGY.

THE particulars of the following case will be found worthy of record, as it was made the subject of careful observation during life and after death.

N. B., æt. 32, about five months pregnant, was admitted into the Hardwicke Hospital, No. 6 ward, August 31, 1866, having been ten hours ill previously. When seen at the hour of morning visit she presented, in an extreme degree, all the well-known phenomena of choleraic collapse. She had the sunken eye, raucous voice, general lividity, and marked blue-black discolouration of the lower extremities, with general dusky hue of the surface in other parts. She was pulseless, the hands and feet were cold, but not remarkably shrivelled. She vomited all that was given her as medicine or drink, but no very excessive action of the bowels was observable from the period of admission until her death. She retained quite enough strength and vitality to sit half up in bed, answer coherently, take drinks without aid, but gradually sank without further vomiting or purging, and died at 3:30 p.m., on September 1st, about twenty-four hours after she had been taken ill.

On post-mortem examination the temperature of the body was observed to be sensibly higher in all parts than for some hours before death; the general lividity, and especially that of the lower extremities, was much less marked than during life. The facies cholericæ continued, however, to be fully characteristic. Dr. Lyons proceeded to make a very careful post-mortem examination.

Heart.—The heart was found of normal size, consistence, and appearance; the right auricle and ventricle contained four to five ounces of black tarry semi-clotted blood. There was a small coagulum of fibrin in the orifice of the pulmonary artery; the left chambers of the heart were firmly contracted, and contained but a trace of blood.

Lungs.—The lungs were somewhat congested, but collapsed to the usual dimensions; on slitting up the bronchial tubes some frothy mucus was found to partially fill them,

and here and there considerable vascularity of the bronchial membrane was observable. On section through the lung tissue, frothy, sero-sanguineous fluid escaped, but there was a total absence of any marked patches of localized congestion, or anything amounting to a "block" of the pulmonary circulation.

Stomach.—The gastric mucous membrane was of a deep brownish red tint; the membrane was soft and slimy, but there was a total absence of any active congestion.

It is to be observed that the intestines throughout were devoid of all fecal or bile-coloured substance whatsoever, and contained some quantity of thickish dirty rice-water matter.

Small Intestines.—The duodenum presented appearances somewhat similar to those found in the stomach. The jejunum was of a pale, dirty, pink colour. The mucous membrane was much softened, and its epithelial covering readily removable as a slimy coating of dirty, pinkish cream colour and consistence. The ileum exhibited more marked changes: the general aspect of the intestine bordered on a rosy pink hue; its mucous surface was here and there, in patches of considerable extent, much abraded, the epithelial coat being entirely removed and the basement membrane exposed, and reddish and angry-looking. The solitary glands and the patches of Peyer were charged with a dirty white exudation, and a general appearance of congestion was noticeable around the patches. At the ilio-colic valves the last patch and the solitary glands exhibited the above-mentioned dirty white exudation in excess.

Large Intestine.—The colon was throughout washed clean, its surface being smooth, and the mucous membrane intact, except in two situations—viz., about the central portion of the transverse arch and the sigmoid flexure. At these points, some three to four inches exhibited an intense amount of blue-black vascularity, corresponding to the primary stage of a true dysenteric process. No gelatinous or lymphic exudation had as yet taken place, but the eye of the experienced pathologist could not fail to detect the well-marked phenomena just described.

Liver.—The liver was normal in appearance; the gall-bladder was full of dark-greenish bile.

Spleen.—This organ presented no condition calling for remark.

Kidneys.—Both kidneys were normal in appearance on section.

Nerve Centres.—The solar plexus and semilunar ganglia were dissected out with much care through a large part of their extent and connexions, but beyond a very slight and possibly accidental state of congestion of the left border of the left semilunar ganglion no morbid condition whatever was discernible.

The ganglia were found with little difficulty, and the nerve fibres were readily traceable and firm in texture. Dr. Lyons has so repeatedly examined the cranial and spinal nerve centres with negative results, that it was deemed unnecessary to make any special examination of the brain or cord in this case.

In carefully analyzing the phenomena presented in this case, and comparing them with those exhibited by others in the present and in former visitations of this disease at home and abroad, Dr. Lyons is of opinion that we must recognize in cholera as the essential conditions:—

I. A state of constant hyper-stimulated, paralysed, or suspended vasi-motor power most observable in the tertiary (radial and tibial) and ultimate arteries, and probably in the accompanying veins, corresponding to the collapse of cholera, with coldness and blueness of surface, shrivelling of the skin in the hands and feet, and death as an immediate result, when the first impression is sufficiently profound.

II. That the foregoing state may be present to an extreme degree, and may even cause death, without the development of specific lesion cognizable post-mortem, as in cases of cholera sicca, or dry cholera—i. e., without vomiting or purging.

III. That the special portions of the nervous system engaged are presumably the vagi and sympathetic centres.

IV. That congestion of the lungs is an occasional but not necessary condition in cholera, and is due to lesion of the pneumonic plexuses.

V. That gastro-intestinal irritation, with vomiting, purging, and rice-water evacuations, are constant, but not universal or necessary phenomena in cholera, and are due to irritation of the gastric, solar, and splanchnic plexuses.

VI. That in the absence of constant or specific lesion in the nerve centres of the vagi and sympathetic, the phenomena of the choleraic condition, which fall essentially within the domain of these centres of nerve power, are due to a potent dynamic agency influencing the nerve centres in question and their branches as conducting media, but not necessarily leaving cognizable physical changes in them.

VII. That the agency producing cholera is thus analogous in dynamic effect to that by which lightning, an excessive electric shock, severe concussion, a blow on the head, the spine, or the stomach, prussic acid, woorali, snake, or other animal or vegetable poison kills, "and leaves no sign."

VIII. That in this view, rigorously considered, the remedy logically indicated by physiology and pathology, is one capable of acting on the vagi and sympathetic centres with great potency; (a) that possibly in some alkaloid of great potency such a remedy may yet be found; or (b) in some modification of electro-galvanic agency.

IX. That in view of the foregoing conclusions, it cannot be admitted that a leaven, poison matter, or other material element of either organic or inorganic origin is introduced into the body from without, or generated within, which demands elimination. And that the phenomena of vomiting, purging, and collapse, are the expression of excessive morbid functional disturbance, in the continuance of which life is being eliminated; and lastly, that an eliminative medication, as a curative agency, has no basis or rational foundation in pathology.

On logical conclusions from the pathology of cholera, as it has been here upheld, and at the suggestion of Dr. Mapother, the effect of the Calabar bean, as a powerful agency peculiarly influencing the sympathetic system, is being tested in Dr. Lyons's Clinique in cholera cases. One patient has recovered under its use.

Reviews.

EDINBURGH MEDICAL JOURNAL. September, 1866.

THIS number opens with Professor Christison's learned Graduation Address, lately delivered at Edinburgh University. It likewise contains two curious papers; one "On the Age of Nubility," by Dr. J. Matthews Duncan, and another entitled "Observations on the Physiology of the Larynx, by John Wyllie, M.D. The first of these concerns all who are married, or who intend to be married; and the second, an Inaugural Dissertation for which a gold medal was awarded by the University of Edinburgh at the Medical Graduation of August, 1865, we specially commend to musical members of our profession. Dr. George Steel of Montrose, gives a paper on cholera, read before the Forfarshire Medical Association; and Dr. G. Hamilton of Falkirk, concludes the "Original Communications" with a short paper "On Dislocation of the Shoulder Joint." The other portions of this number are worth reading.

THE GLASGOW MEDICAL JOURNAL. Sept. 1866.

THIS periodical, which is No. 5 of the new or Monthly Series contains the continuation and conclusion of Dr. J. Warburton Begbie's paper on Anthracosis; a paper on Congenital Goitre, by Dr. Alexander R. Simpson, as communicated by

that gentleman to the Glasgow Medico-Chirurgical Society; a paper on the Preventibility of Cholera by Dr. Andrew Fergus; a case of Strangulated Femoral Hernia, by Dr. John B. McLeod; and a case of Aphasia, by Dr. John Barclay. On Dr. Johnson's recent work, Dr. Fergus observes: 1st, "he does not notice the first stage of the disease [cholera]; 2nd, he does not dwell on its preventibility at that stage." Such statements form the text of Dr. Fergus's discourse; and his advice is this in effect:—"Fear not cholera; do not take brandy or change your usual diet, if it be simple and easy of digestion; do not fatigue yourself; keep up the proper temperature of the skin; keep a solution of morphia, or laudanum, as a pocket companion, and stay in bed for a short while after the premonitory diarrhoea has been checked.

THE MEDICAL MIRROR. September, 1866.

THIS number opens with a paper, reprinted from the *New York Medical Record*, on the infectious character of cholera and the necessity of quarantine, by Dr. Charles A. Lee of New York, and Dr. J. M. Toner of Washington. "Holiday Notes on Paris and its Hospitals" are continued; and are followed by an Essay on the Preservation of Health, by Thomas Inman, M.D. We observe that Dr. Inman's observations are "to be continued monthly," and we are sorry for it. His present paper is written in a style of forced jocularly, and exhibits nothing but professional emptiness. The series is possibly designed to be reprinted for popular, not for medical circulation. This we gather from the style, and from the writer deliberately travelling out of his subject (the preservation of health) to show contempt of God's Word and Commandment, and to give an igno rant insult to a chivalrous and hospitable nation. On page 528 he says:—"The Arabs are pointed at as mirrors of longevity, but when the authority is asked for, it is found in the Bible, whose older authors exaggerated to the full as much as does a modern Irishman, and who say a hundred when they mean a dozen." If the Editor of the *Mirror* desires a large circulation for his Journal, he must exclude heresy and international rudeness from its pages.

The next paper is entitled "Remarks on the Oil of Yellow Sandal Wood in the Treatment of Gonorrhœa," by Dr. H. S. Purdon of Belfast; and besides other interesting matter, a curious letter appears from "A Printer's Devil" on the Cost of the *British Medical Journal*.

MADRAS QUARTERLY JOURNAL OF MEDICAL SCIENCE.

THE editor of the present number is compelled to make a fresh appeal to his professional brethren in Madras to aid him with their contributions. We sincerely hope he may meet with a response. He cherishes a hope that "the only Madras Medical Journal" will not be allowed "to die of inanition." If impossible to carry on a quarterly, we would suggest making it half-yearly, rather than let it drop. Such a medium ought to encourage the Madras Medical Service to enrich our literature with their most practical contributions. In the present number the principal of the Medical College, Dr. S. Smith, continues his ophthalmic papers. Mr. H. King gives some "American Notes," and Dr. Macbeth furnishes a "Special Report as to the relative effects of hill and plain stations on the sanitary welfare of the 74th Highlanders." We notice also in the miscellany tables of meteorological results for the year 1865.

CHOLERA: a new Theory. By C. D. KINGSFORD, M.D.

THE theory proposed is, that the disease is due to poisoning by phosphorous, which finds access in the form of phosphuretted hydrogen. The treatment recommended is the calo-

mel one that has already been, so the author thinks, the most successful of all, and he explains its efficacy by "the chlorine of the calomel uniting with the hydrogen of the poisonous gas, while the metal hydrargyrum is reduced and rendered inert by the phosphorus.

MECHANICAL TREATMENT OF CHOLERA. By a Physician.

THE treatment is this: "Let the patient be placed, supported on a flat board in a horizontal position, and on his back, the legs being partially flexed. In this position a rocking saw-saw, or to-and-fro movement must be communicated to the body, either by means of rollers, or by poising the board upon semicircular supports, or by suspending it from above." In this manner the author proposes "to give momentum to the blood, and to compel it to circulate, also to induce respiration by the concussion of the intestines against the diaphragm synchronously with the momentum imparted to the blood." Some other means are also proposed as adjuncts to this treatment.

We have also received a pamphlet on cholera by Joel Shaw, M.D., author of the "Hydropathic Family Physician," and R. T. Trall, M.D., author of the "Hydropathic Encyclopædia." Wine as it should be, by J. L. Denman. Letts's General Map of the Seat of War, and a number of periodical publications which must at present stand over.

THE RICHMOND MEDICAL JOURNAL FOR JULY.

THE Southerners are evidently recovering from the effects of the war, and the medical art is beginning to flourish again in Richmond, where this journal is published.

This number consists of 87 pp. 8vo, and has among its original communications "Observations on Cerebro-Spinal Meningitis," by Dr. Bedford Brown; and a paper on Vaccine Lymph treated with Glycerine, by Dr. Henry of Wiesel. It also contains a Lecture on our recent advances in the Diagnosis and Treatment of Functional Diseases, by Dr. Brown-Séguard; and an Essay on Ozone, its Relations to Health and Disease, by Dr. Gaillard, one of the editors.

AN elegant little work, entitled "A Handy-book of Ophthalmic Surgery," by Messrs. John L. Laurence and Robert C. Moon, has just issued from the press, and no book on ophthalmic surgery was more needed. Designed as it is for the wants of the busy practitioner, it is the *ne plus ultra* of perfection, it epitomises all the diseases incidental to the eye in a clear and masterly manner, not only enabling the practitioner readily to diagnose each variety of disease, but affords him the more important assistance of proper treatment. The chapters on optics—a subject so important, yet hitherto so little understood by the profession generally—are worthy of an accomplished oculist like Mr. Laurence, though perhaps we are no warranted in saying they are written solely by him. Altogether, this is a work (and published at a very moderate price) which ought certainly to be in the hands of every general practitioner.

LOCAL ETHEREAL ANÆSTHESIA.---A series of operations have been performed by M. Demarquay, at the paying hospital of Paris, advantage being taken of pulverized ether. Dr. Richardson's apparatus was employed with a slight modification. Instead of the two india-rubber balls, only one is used, and the air is forced into it by a small air-pump. M. Demarquay says that with the pump an ounce of ether is vaporized in one minute. The pump is worked with more or less energy, according to the thickness of the jet.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 12, 1866.

THE CONTAGIOUS DISEASES ACT OF 1866.

THIS Act which lately received the Royal assent, and which will come into operation on the 30th of the present month, is a far more important measure than is generally supposed, and although apparently only a supplement or amendment of the Contagious Diseases Prevention Act of 1864, it is in reality an approximation to the system of licensing prostitution, after the example of many Continental cities. The jurisdiction of the Act is still limited to certain towns in Great Britain frequented by soldiers and sailors, and includes Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Windsor, Colchester, Shorncliffe, the Curragh, Cork, and Queenstown, but there can be little doubt that in course of time a similar kind of legislation will be applied to other localities, if the working of the present measure should turn out to be successful, and if the popular clamour likely to be aroused by such a scheme can be either silenced or evaded. In the instance of the Act just passed, its promoters have managed to smuggle it, as it were, through both Houses of Parliament, and it is now the law of the land, but many of its provisions will startle not only those who advocate in the widest sense of the term the liberty of the British subject, but also the moralists who argue that the particular diseases against which the powers of the Act are directed ought to be left to run their course unchecked by the Government or the Legislature.

It is indeed extraordinary that such an Act, having for its object the control and prevention of venereal diseases, which, after all, are caused by vice or imprudence, should have been passed by the representatives of a nation which has hitherto refused or neglected to support any efficient measure for the suppression of a cognate malady—namely, small-pox; and that while the most stringent regulations are laid down for punishing offenders and curing patients in the one case, the most inefficient and palpably abortive steps are alone countenanced or encouraged in the other. The force of our remarks will be at once apparent when we present to notice some of the outlines of the provisions of the Contagious Diseases Act of 1866.

It might have been supposed by many persons that it would be sufficient to take peremptory steps against a woman when it was proved or even asserted that she had communicated disease, but in the present measure it is not at all necessary that any such accusation should be brought against her, and it is only required that some one, no matter who, should lay an information on oath that he or she has good cause to believe that *the woman is a prostitute*, and that she is living or has visited in or

near a place specified in the Act, when forthwith the Justice is empowered to order the suspected person before him and to direct her to undergo a periodical medical examination. If, after such examination, she is found to be diseased, the certificate of the Surgeon is a sufficient instrument to authorize her immediate conveyance to one of the Hospitals established under the Act for her reception, and in this Hospital she is virtually a prisoner until a certificate of the Hospital Surgeon declares her to be free from her malady, and this latter certificate the Surgeon is compelled to give, and the woman is enjoined, under the most severe penalties, to preserve. For it is expressly stated that in any case where there is any doubt as to her being free from disease, the onus of proof *lies on herself*, and the possession of the certificate is the protection which she enjoys in the exercise of her calling, and the ground of exemption from being compelled to appear before the Justice. Of course this is nothing more nor less than a legalization of prostitution, and as the medical examinations are periodical, a sort of guarantee is continually afforded that the woman may pursue her avocation unmolested.

But the non-compliance of the woman with any of the provisions of the Act, or any infraction on her part of the Hospital rules, subjects her to summary conviction and punishment, for if she absents herself from the medical examination which she is ordered to undergo, or if ordered to be detained in an Hospital she quits it without being duly discharged by the Medical Officer, or if she refuses or neglects to comply with the regulations laid down for her guidance when in the Hospital, she is liable to imprisonment with or without hard labour, for different periods, varying according to the discretion of the Justice, or the repetition of her offence; and if she leaves the Hospital without being duly discharged she may be taken into custody *without warrant by any constable*. It is also expressly stated that the woman while being conveyed or while being detained in a Hospital, is to be deemed *legally in the custody* of those who convey or detain her.

On the other hand, it is right to state that provisions are made in the Act for the moral and religious improvement, as well as for the medical treatment, and the due maintenance and clothing, of the women while detained in the Hospital, and that encouragement is given to them to change their mode of life.

Thus it will be seen that these regulations made as to the control and supervision of prostitution are of the most rigorous character, and our opening remarks as to their inconsistency with our usually received notions, both of morality and of personal liberty, will, we think, be fully justified. But, nevertheless, we must admit that the operation of the former Act has been on the whole beneficial, and has not led to the inconveniences or abuses which many persons anticipated, and the extension of the powers contained in the present Act will not, we have reason to believe, be attended with any practical evil consequences, while the early treat-

ment of syphilitic disease will probably do much to mitigate its virulence, and the hygienic and legal rules now enforced will materially check its propagation.

SMALL PROFITS AND QUICK RETURNS.

[COMMUNICATED.]

“SMALL profits and quick returns,” a phrase which has grown to be an axiom in commerce, has no application to medicine. We cannot treat patients like pounds of sugar, and run through them at railway speed, fingering the fees as we pass. If they permit such treatment it is to their own loss; and he who so acts, degrades his profession without benefiting his fellow-men. Each case must be carefully individualised, and the state of each organ carefully ascertained before we can certainly say that we thoroughly know the case in all its bearings; and till we do so, we cannot treat it, except in a hap-hazard fashion. All this, however, requires the expenditure of both time and thought. But he who spends his time in rushing from one sick room to another has little to spare for his patients, and of necessity must show their cases or treat them generally to their manifest detriment; and he whose physical energies are exhausted by his continuous bodily labour, has none left to be expended in careful thought as to any one of the many cases which pass phantasmagorically before his eyes. Overgrown practices are, therefore, a huge evil in medicine; they injure the physician by wearing him out before his time, and they injure his patients, because his overtaken and exhausted energies are unable to do justice to their cases. It would be easy to run over a long list of names of distinguished men who have been, within the last few years thus prematurely lost to their friends, their families, and their country, through their over anxiety to make the most of that tide of fortune which had at last begun to flow for them. But who can reckon the hours of suffering caused, and the lives actually lost, from the careless haste with which the patients of such men were of necessity hurried through. The evil is manifest, the remedy, too, is equally clear—but the one is not easily corrected, nor the other applied. Still, something may be attempted; and if the profession were true to themselves and to their aspirations, much might be done which would in time bring about a different state of matters. The first step to this must be an entire revision of the present method of paying medical men. To pay a medical man by the visit is to offer a premium, not for care in discriminating the nature of a case, but for haste in rushing from one patient to another, while it actually tends to the undue remuneration of him who, by careless haste, protracts the disease, and to the mulcting of his due reward him who, by careful discrimination, succeeds in more rapidly curing his patient. The remedy for this would be to pay all general practitioners an annual retaining fee. Though not a perfect prevention of the evils referred to, this would tend to remedy them; it would prevent an unskilful practitioner being unduly rewarded for his very want of skill,

while the more skilful would reap their reward in the saving of their time and strength—a saving of which their patients would reap the benefit in the improved skill and matured judgment derived from a robust and healthy intellect never exhausted by unnecessary bodily labour.

Further, we pay our accoucheurs large fees for superintending a usually normal physiological act, and we also highly remunerate our surgeons for careful pathological dissection; but for the opinion of a physician—which to be of value must combine the essence of many sciences and the result of much deep thought—we pay the conventional fee of one guinea, though to the patient it is, as a rule, of far more importance than the superintendence of the accoucheur, and not less so than the operative interference of the surgeon. This, therefore, is another evil to be remedied, but whether by the physician making a separate charge for each case, according to its importance and the time spent upon it, or by leaving the remuneration to the patient, it may be difficult to say—we incline to the former method, and we think that a reasonable tariff might easily be laid down by the profession both for the consulting physician and for the general practitioner. For the latter, an approximation to the method generally adopted in Bengal might be found the most easily applicable—there one week's pay is usually set aside for the doctor, exclusive of separate payments usually made for such extra events as accouchements or surgical operations; and I think there are few of us who would not be contented with one week's pay from each of our patients. Medicine will never be at the best a money-making profession. At present it is the hardest worked and poorest paid of any, and it is our bounden duty to ourselves, our families, and, let me add, our patients, to secure by combined action a competent remuneration for our labours without the necessity for that overwork which is alike injurious to both physician and patient. Further, we think that the profession are all too steadily and continuously kept in harness; all work and no play makes Jack a dull boy, and the doctor's brains get muddled, too, by the close gathering of professional cobwebs round them. A little more unity in action, a little less self-seeking and more courteous deference to the opinions of others, would help us to work better together, and secure for each of us a more frequent holiday. A rush to the coast or the Continent for a few weeks in autumn is not enough; we want the cobwebs blown off oftener, and stand as much in need of a Saturday half-holiday and a Sunday's rest as any counterjumper or a cabdriver of the lot, and there is no reason why we should not get them—not regularly, perhaps—but now and then. Moneymaking is fortunately not the chief end of man; the medical man has but little chance of attaining that end. In attempting it, as matters now stand, he too often neglects his patients, degrades his profession, and shortens his own life; but competence and happiness are within the reach of all, and would be more easily attained by all, were

the profession not so much a conglomeration of atoms of repellent opinion on all points as it now is, but more united in action, especially as to the matters we have referred to. Small profits and quick returns must not be our motto, but a fair day's pay for a fair day's work; and if we cannot introduce the ten hours' system, let us at least strive for an occasional Saturday half-holiday.

Correspondence.

STATE OF THE DRUG TRADE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your Correspondent, Mr. Martin, has argued, in both of his letters, as if small doses and homœopathy were identical, but Hahnemann in his *Organon* (I. 206) has laid down three criteria whereby we may judge of any treatment, whether it has been truly homœopathic or no, and the first of these is, "the operation of the remedy must be purely *dynamic*." In regard to the term *dynamic*, I may remark, that it was laid down as an axiom by the founders of homœopathy, that in proportion as the material element disappeared from the remedial agent, so did its curative spirit become developed; and this spiritualisation of the remedies has been termed *dynamisation*, and the action of their medicinal spirits, *dynamic*. Whenever, therefore, a drug is administered in a material dose, so as to act in virtue of its ordinary physiological properties, it is not employed homœopathically, however small the dose may have been. Rhubarb, when employed homœopathically in a diarrhœa, ought to be used in such doses as shall act only dynamically, that is, by curing the diarrhœa *tuto cito et jucunde* without any previous purgative action. Rhubarb employed as a purgative, in however small a dose, acts antipathically or physiologically, and in direct opposition to all the homœopathic doctrines. The statements of proof, therefore, which I have brought forward, have been of a totally different character to those advanced by homœopathists; they assert that a certain drug given infinitesimally has cured a disease silently and without physiological action, I assert that in certain cases, rare they may be, a much more minute material dose of a drug is capable of producing its physiological action than is generally thought possible; that it is of the utmost importance to employ the smallest effectual dose, so as to avoid the results of reaction; and that our drug trade ought to be efficiently supervised so as to see that our prescriptions are properly made up for that end. My statements are directly opposed to the fundamental axioms of homœopathy, and have a direct application to the improvement of the healing art. I may add, that one of my patients was once nearly killed by hypercatharsis produced by one five-grain colocynth and hyoscyamus pill, prescribed in consultation by a physician, who, like Mr. Martin, disbelieved in the power of small doses. Further, Mr. Martin acknowledges that one-twelfth of a grain of podophyllin is an active dose, the object of my article was to ensure the adoption of means to make it certain that our patients got no more and no less than the exact dose prescribed. Surely he will agree that it is of no less importance that this should be the case, whether we prescribe twelfths of a grain of podophyllin, or eighths of a grain of rhubarb, and reserving his right to doubt the efficacy of the latter, he ought rather to have aided my endeavours to improve the state of the drug trade and to remedy that anomalous condition whereby we are, as at present, wholly unable to state positively, whether the overaction of one pill out of twelve and the non-efficacy of the rest is due to careless admixture or to some temporary peculiarity of our patients' *ilia*. Till we have some means of

ensuring the scrupulous accuracy of the making up of our prescriptions, we have no accurate means of knowing with certainty the actions of any drug, surely Mr. Martin is as much interested as I am in ascertaining these, and his pen would have been much more nobly and beneficently employed in helping to further this great end than in carrying on a controversy which, as he truly says, can "lead to no useful results."—I am yours, &c.

THE AUTHOR OF THE ARTICLE REFERRED TO.

A FEW HINTS TO YOUNG GENTLEMEN DESPERATELY ANXIOUS TO ENTER THE ROYAL NAVY AS ASSISTANT-SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

YOUNG GENTLEMEN,—I am what is usually called, an "Old Stager." I entered the Navy before steam, and have had the honour of being a member of a Midshipman's berth with the son of an Earl, who was allowed £50 a year, when we had to "grab for our quib;"—for let me tell you, in those days on ships' allowance, upon which, I am sorry to say, we were too often compelled to feed, because our mess subscription supply was not only devoured—every fellow for himself—but it used to be "cut out" by the officers of the middle and morning watches—was but a poor morsel, particularly when one-half was bone, and the peas hard as bullets, our soup being pea water; and then there was such a smashing and tearing amongst the crockery, that our pockets could not keep both going upon the above allowance of £50 a year. Because, besides your mess, washing, and servants, which must be paid, if you have no cash you could not go on shore for a cruise. Now 6s. 6d. a day was not very tempting, but promotion was faithfully promised; but, the fact is, put your faith in nobody. I have many fair promises, but they vanished all "in nubibus." However, there must be a Jonas—somebody must get on; that is all very true, and as there is only one Inspector-General how many are looking towards it? Now, I want you to look at your position; if it is the bare pay you are looking for, then, Gentlemen, I wish you good morning; but if you look to your position as gentlemen, as young men of respectability, talent and education, you must naturally ask how you are to be treated on board a man-of-war; you are now in the ward-room, with 10s. a day, and the Executive look down upon you, you are still looked upon as the "Doctor's Mate." You have £182 10s. 4d. a year, you cannot well live under 5s. a day, and that about £100 a year, so you see what you have left to meet all your other expenses. Well, suppose we let this pass, are you never to become old; what are your future prospects, because these should be the main object, you have your eyes open, when you are old, aged, passed use, with a wife and a family, will 11s. a day support you decently, the highest half-pay a surgeon can get? Do not leap in the dark—look at it, I have not only looked at it, but tried it—and to live in society I could not—rent, taxes and food left me pretty ragged and bare; 12s. 6d. should be the lowest half-pay; 15s. after ten years, and so on in proportion. But the late regulations are positively absurd, ridiculous; if you retire your half-pay is 5s. 10d. or one-half of your full pay, so that if you are on 17s. 6d. a day you will have the enormous sum of 8s. 9d. to luxuriate upon; and for this paltry sum you even sacrifice a whole life.

Let us be put on a footing with our combative friends and quondam messmates; let us have a retired promotive list, so that a retired Surgeon can attain the rank and half-pay of an Inspector-General of Hospitals, as well as a Commander can attain that of Admiral upon their Retired List per Order in Council. Fair play is bonny play. The public pays both of us; then why make fish and flesh? Let us see who is hardest worked and worst paid. What has a Captain to do?

Literally nothing, but strut about in full or any dress he pleases, and give orders. What has the Surgeon to do? Will the Captain visit with him his cholera and fever patients? Will he walk with him where death is staring the Surgeon in the face every hour of the day? Will he sit by the bedside of a cholera patient? He may fight his ship well—no thanks for that—he would be a coward if he did not, therefore no praise; but look how cool the Surgeon walks the realms of death. He saves the Captain's, the Admiral's, and his wife's life, and what thanks does he get? Young gentlemen, take my advice, remain where you are until the Admiralty will place you in your proper position, particularly as regards your future half-pay, &c. &c.—Your sincere friend,

THE OLD STAGER.

August 30, 1866.

FEES FOR ATTENDANCE ON THE FAMILIES OF MEDICAL MEN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Will you permit me, through the medium of the columns of THE MEDICAL PRESS, to place before the profession a few facts requiring its notice. In the garrison town of the county Fermanagh a medical practitioner was called in to see the child of a medical man suffering from a simple attack of measles. The father, a gentleman of status in the profession, but residing at too great a distance to attend himself; and at the end of a week a sum of £3 for attendance, and 10s. for medicine, was demanded. Such a demand no doubt surprised the father immensely, as he regarded it as being entirely opposed to the well-understood practice, that attendance on the families of medical men was never charged for. In this instance the child was staying in the same town, consequently no expense was incurred beyond the mere visit. The fact of the father being a medical man was also made known to this gentleman; however, the influence of lucre predominated, and the fees were pocketed.

Having mentioned the matter to other members of the profession, they concurred with me that the matter should get publicity, in order that the profession should have an opportunity through you of pronouncing its opinion on such sharp practice.—I am, sir, yours, &c.,

MEDICUS.

I enclose my card, but not for publication.

September 3rd, 1866.

[We consider the conduct described by "Medicus" to be altogether unprofessional. We are happy to know, however, that the case is as rare as it is contrary to the ethics of the profession of physic.—Ed.]

GRIEVANCES OF NAVY SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Will you allow me a small space in your valuable columns to lay before the public at large one of the greatest medical grievances of the present day. The Admirals having a seat at the Admiralty Board have taken good care to feather their own nests well, let who will pay the piper. They have got established by an order in Council a Retired List for Promotion for themselves, so that a Retired Commander can creep or jump up this list to the rank of Admiral, receiving an increase of pension as he goes on according to his rank. Bravo! old Benboers. What have they done for the Surgeons, for the men who saved their lives, who risk their own lives hourly in the regions of death at all times and in all climes? You will laugh when I tell you, nothing—literally nothing; then, these are the thanks of a British Peer and an English Admiral. Could not those Admirals find in their hearts a desire to do justice to the Naval Surgeon? Could they not put him on a list similar to their own as a small reward for past services? A Captain may be a brave man in fighting his vessel, and undoubt-

edly he is, but I very much doubt whether he would walk the wards of a cholera hospital as coolly as the Surgeon; forced bravery is one thing, but cool, collected, and undaunted bravery is another. Yet these brave men go unrewarded. If they are not worth having, why employ them? If you want first-rate young men, why offer a lollyboy's prize; why offer an insult to talented, educated, and respectable young men? No, Sir, take what you can get, since all's fish that comes into your net; but our class will not enter your service until we are put upon a proper footing, and so, my Lords of the Admiralty, good bye.—I am, &c.,

M.D.

POOR-LAW PLURALITIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I am informed that the Poor-law Commissioners have made a rule (not retrospective) that for the future no medical man shall hold both a workhouse and dispensary at the same time. Pray be so kind as to tell me is this the fact, and oblige yours faithfully,

ONE TWENTY YEARS A SUBSCRIBER.

[We are not aware of the rule to which our Correspondent refers. He had best apply to the Commissioners, who are the proper authorities on the subject.—Ed.]

POOR-LAW MEDICAL INSPECTORS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Every medical officer connected with the administration of the Poor-law Charities of Ireland is, or ought to be, a subscriber to your journal, therefore I trouble you with a remark or two, by way of following up your admirable, though brief, observations of the 29th ult. The qualifications of certainly at least 100 out of the 1000 gentlemen at present in the Poor-law service for the office of Medical Inspector is unquestionable, and nothing but the supineness of the medical officers can hinder one of their number being appointed to the coveted post. This would not only be an honour to the whole body, besides establishing a precedent for the future, but must also be calculated to excite a laudable ambition, and stimulate honourable exertion, while to be overlooked is to be disgraced.

Every man, by every fair means, should endeavour to establish the principle that promotion must be in the service. Just fancy a civilian or naval surgeon being appointed to the office of deputy-inspector in the army! Would the surgeons and surgeon-majors endure such treatment? It is within my own knowledge that physicians never connected with the Poor-law service, and surgeons of county infirmaries, are making strenuous exertions to secure the appointment. Already the press, lay and medical, has done something to avert such an insult. Now is a good time for our local societies to show practically their value and importance. Every man should do a little, and speedily, to put the case in its proper light before the Government, the Poor-law Commissioners, and the public, without fear or jealousy, and the result need not be feared. I enclose my card.—Yours truly,

AN OLD DISPENSARY SURGEON.

Notes on Current Topics.

SCURVY.—In a powerful article on the condition of our merchant seamen, the *Times* draws attention to the subject of scurvy, and denounces as "scandal to their common sense, as well as to their humanity," the neglect of merchants to protect their crews from this disease. This is a subject on which the profession will gladly welcome the aid of the *Times*. We have often and over drawn attention

to the neglect of all proper precautions, and invoked the action of the Legislature without which the condition of the sailor will find little amelioration. The press may excite indignation, but the excitement will soon pass by, and then the shipowners will relapse into their previous carelessness. In the *Dreadnought* Hospital ship alone 100 men are annually disabled by scurvy. Taking other ports than London, how great must be the misery caused by masters going to sea without lemon juice, or with a supply of inferior quality. With scurvy almost unknown in the Royal Navy, there is no excuse for its existence in our mercantile marine.

WOOLWICH BOARD AND THE REGISTRAR-GENERAL.—The local Board of Health of Woolwich has put forth a statement in opposition to that of the Registrar-General. From this we learn that at the first outbreak of cholera in London a sanitary committee was appointed. This committee met daily and has been aided by the Garrison Sanitary Committee. Only twelve deaths have occurred up to the 4th of September, and this out of a population of 41,000, of these one case is said to have been imported, and in nearly all the others gross error of diet or long neglected diarrhoea had been proved. No second case has occurred in the same house, nor even in the same street. A cholera ward has been open two months, but no patient has been received, and if house-to-house visitation has not been carried out, it has only been because there was no prevalent diarrhoea to call for this step. We are glad to record that the board feel ready for emergencies, and we hope that the efficiency of their preparations will not be put to the test by a visitation of the disease.

THE IRISH SCHOOL OF SURGERY.—*Apropos* of the state of Ireland, the *Times* remarks that the "well-known excellence of the Dublin School of Surgery accounts for the professional deputation which heads the list" of addresses to the Viceroy: and adds "The Royal College of Surgeons in Ireland represents almost a special faculty, and its compliments to the new Viceroy were naturally paid." We felicitate our Irish professional brethren on the recognition of their merits by the general public. The compliment now made by the *Times* has long been deserved. It is, however, worthy of remark that in the details of this compliment the *Times* is wrong as it is in most statements about Ireland. The deputation referred to was *not* the first professional one which waited on the Lord Lieutenant. The King and Queen's College of Physicians in Ireland headed the list, and both it and its surgical sister merely followed a long continued usage in addressing the Lord Lieutenant on his arrival in Dublin.

WATER BUTTS.—The lay press is already taking up the impropriety of storing our drinking water in butts and cisterns, which too often become the receptacle, of diseases and against which system we have several times lifted up our voice. One of the most urgent of all sanitary reforms needed is the total abolition of the cistern, and a constant supply of water at high pressure. In the poorer neighbourhoods especially, this is the cause of other diseases besides cholera. The monopoly of the companies must be put *an end to*, and a plentiful supply of pure water obtained.

CONVALESCENCE AT WALTON.—There is a Convalescent Asylum at Walton-on-Thames to which some of the convalescents from cholera have been sent. Now the Asylum is situated a short distance above the point where the water companies take their supplies for distribution over London. If the statement recently made by Dr. Andrew Clark of the London Hospital, be accepted, that there is great danger of convalescents propagating the disease, we may well feel

nervous at this new danger with which the metropolis is threatened. It is in the public interest that we ask what becomes of the excreta of the patients sent to Walton?

THE MEDICAL CLUB.—A Meeting of the promoters of the proposed Sydenham Club has resulted in the election of the following committee. Treasurer: Mr. Propert; Secretary: Dr. Lory Marsh. Drs. Fraser, Richardson, Stillwell, Bennett, Tilt, Foster, Messrs. Grigg, Slaughter, Clement, M.P., and others. The difficulty of organising a club is not generally known, and the fact of more than a hundred members of the profession having promised to join it is sufficiently encouraging for the time it has been proposed.

INFANTICIDE.—Under the title of "A Few Thoughts on Infanticide," Mrs. M. A. Baines has issued a small pamphlet bearing upon the remedial measures which ought to be adopted for this crime, now unhappily so prevalent among us. The authoress, whose sentiments in general do her infinite credit, thinks that the law is at present too lax in punishing child-murder, and that when "wilful murder" can be proved in such a case, the penalty ought to be enforced. She also thinks that to prevent infanticide "Burial Clubs" ought to be discouraged as much as possible, as they tempt needy or wicked parents to the commission of the crime; that still-births ought to be registered; that women who act as midwives to the poor should be compelled to take out a licence; and that the accidental deaths said to occur among infants by suffocation and burning ought to be minutely investigated. But in order to palliate the evils now existing, if not to eradicate them, the authoress of the pamphlet advocates the establishment of hospitals, in which not only the children should be received, as in ordinary foundling hospitals, but where the mothers could be received also; and it is argued that the cares of maternity would not only be physically beneficial to the children, but that they would act on the moral nature of the mothers, leading them to follow afterwards a virtuous course of life.

DR. EDWARD SMITH AND THE METROPOLITAN POOR-LAW MEDICAL OFFICERS' ASSOCIATION.—The Metropolitan Poor-law Medical Officers' Association have just published a report in reference, or in reply to Dr. Smith's "Report on the Metropolitan Workhouse Infirmaries." Dr. Smith's report, besides advocating several very novel views as to the cubic space and the ventilation which ought to be afforded to sick paupers, touches in a somewhat slighting, if not condemnatory tone, upon the conduct of the Poor-law Medical Officers in the discharge of their duties, and in their relations to the respective Boards of Guardians. With regard to the question of cubic space, in which Dr. Smith is at variance, not only with the great majority of the Poor-law Medical Officers, but with all the highest sanitary authorities in Great Britain, we very unhesitatingly rank ourselves among Dr. Smith's opponents, and we are glad to observe that the Poor-law Medical Officers "renew with even more urgency than before the appearance of Dr. Smith's report, their demand for 1000 cubic feet and 80 feet of floor space per bed." In his remarks upon the conduct of the Poor-law Medical Officers in the discharge of their very onerous and ill-paid duties, Dr. Smith is both un-courteous and unjust, and, indeed, he shows himself to be quite ignorant of what has transpired of late years between Boards of Guardians and their Medical Officers. When he states that the latter have been remiss in their duties in not pressing upon the former the adoption of sanitary and hygienic measures, his accusation is altogether un-called for, and is very properly repelled and repudiated by the gentlemen who have drawn up the Medical Officers' Report. 'Had Dr. Smith's knowledge of the Boards of Guardians

been more extensive," they say, "he would have known how little avail it has been to press upon them scientific and technical knowledge, respecting ventilation, cubic space, and dietary. He would have known that it has happened that the most energetic and faithful of the Medical officers have incurred the ill-will of their respective boards, and unmerited odium and unpopularity by doing their duty in these respects." The report of the Medical Officers merits the most careful perusal, as it satisfactorily answers the report of Dr. Smith; but, while it defends its own body from the aspersions unjustly cast upon it, the report warmly expresses its approval of those of Dr. Smith's suggestions and observations as are founded upon correct data. We are sorry to find at the conclusion of the Medical Officers' Report, that a complaint is made of want of personal courtesy on the part of Dr. Smith towards his brethren of the Poor-law Medical Service.

THE CHOLERA.

CONTINUING our report of the progress of the cholera we have once more to record a decrease in the epidemic. The last weekly return of the Registrar-General gives only 198 deaths from cholera, as against 265 in the previous week. In the week ending on Saturday, September 1st, the thirty-fifth week of the year, the total mortality of London was 1413. This is an excess over the estimated return of 154, due allowance being made for the increase of population, so that once more the excess is more than accounted for by the deaths from cholera alone. The total deaths from cholera and diarrhoea in ten weeks, up to September 1st, have reached the number of 6012.

Of the 198 deaths from cholera, 6 occurred in the west districts, 15 in the north districts, 9 in the central districts, 122 in the east districts, and 46 in the South districts. While in the east districts cholera has declined rapidly, it is nearly stationary in the southern districts, the deaths happening chiefly by the river at Deptford and Woolwich, where it is to be feared the authorities and the people are negligent. The pumps demand attention, and due care is not taken to prevent the diffusion of the cholera matter. Dr. Greenhill gives a remarkable instance of mortality due apparently to the introduction of a dirty cholera bed, thus enforcing the importance of the precept—Burn all the dirty bedding and linen of cholera patients. Much credit is due to the people for their exertions in suppressing cholera; but with steadier efforts on their part, and on the part of the water companies, the disease will die out more rapidly.

The annual rate of mortality last week was 24 per 1000 in London, 22 in Edinburgh, and 24 in Dublin; 18 in Bristol, 18 in Birmingham, 64 in Liverpool, 29 in Manchester, 20 in Salford, 27 in Sheffield, 30 in Leeds, 22 in Hull, 28 in Newcastle-upon-Tyne, and 26 in Glasgow. The rate in Vienna was 34 per 1000 during the week ending the 18th ult., when the mean temperature was 1.5 deg. Fahrenheit higher than in the same week in London, where the rate was 31 per 1000.

At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 29.586 in. The barometrical reading decreased from 29.91 in. at the beginning of the week to 29.16 in. on Wednesday. The mean temperature of the air in the week was 61.2 deg., which is 0.5 deg. above the average of the same week in 50 years (as determined by Mr. Glaisher). The highest day temperature was 78.5 deg. on Sunday. The lowest night temperature was 46.9 deg. on Friday. The entire range of temperature in the week was, therefore, 31.6 deg. The mean of the highest temperatures of the water of the Thames was 63.8 deg.; that of the lowest was 63.5 deg. The difference between the mean dew-point temperature and air temperature was 7.4 deg. The mean degree of humidity of the air was 77, complete saturation being represented by 100. Rain fell to

the amount of 0.73 in., of which amount 0.60 in. fell on Wednesday. A thin mist was observed on Wednesday and Thursday; no traces of it were perceived on other days during the week.

A supplement to the weekly return of the Registrar-General treats of the condition of the reservoirs of the London water companies, and contains an important letter from Dr. Frankland. We quote from this letter the following paragraph in reference to the East End Company:—

"I was astonished to find that the water, after being carefully brought down from Tottenham Mills in a special canal, purified by a most elaborate and efficient system of filtration at Lea Bridge, and then, to secure it from atmospheric impurities, conveyed in an iron main down to Old Ford, is stored in a reservoir sunk to the depth of some sixteen feet beneath the low ground, which is here only just above the level of spring tides, and that when the reservoir is full the level of the surface of the water in it only reaches that of Trinity high water mark. This reservoir, as I was informed, is excavated in clay, but the side next to the navigation branch of the foul River Lea is of gravel. No doubt this is well puddled, and the brickwork sides executed in the best possible manner; nevertheless, the position of this reservoir, with its two and a half acres of floor sixteen feet below the surface of a badly drained district, is fraught with much peril during the prevalence of epidemic disease. Whatever precautions may have been taken so far, to some extent, must take place into such an excavation, and it was stated to me that when the reservoir is emptied such so-called water, though not in large quantity, has to be removed by pumping.

"Such being the conditions of storage the application of any temporary remedy is obviously surrounded with formidable difficulties. I satisfied myself that filtration through coarse animal charcoal could easily be applied in the Essex and Middlesex wells at Lea Bridge, to the whole of the water supplied by the company, but there would be little use in thus purifying the water at Lea Bridge when it has afterwards to be stored in the reservoir at Old Ford. It is only by passage through animal charcoal, as the water leaves this reservoir, that the advantages of the charcoal could be secured. Owing to the construction of the works at Old Ford, I was unable myself to form an opinion as to the possibility of such a filtration being carried out there at a short notice. Mr. Maine thought it could be accomplished without difficulty; but Mr. Greaves, who is much more likely to know, was of a totally different opinion, and thought that such a filtration could not be effectively carried out at Old Ford without the construction of new apparatus, which would require too much time to render it available during the present emergency. It is to be hoped, however, that means may be taken without delay, either to alter the place of storage, or to render practicable filtration through animal charcoal immediately before the water is supplied to consumers."

Some of our contemporaries, which profess to give the latest news of cholera, have recently stated that the epidemic has not yet appeared in Italy.

We regret that most reliable information, which we have received from both private and public sources, renders it our duty to show that our contemporaries have been completely misinformed; for, unhappily, cholera has spread over a large field of the Italian Kingdom, nor is this a matter of surprise, the disease never having left Marseilles. It might have been concluded that in such ports as Genoa and Naples it would not be likely to be excluded. Moreover, as we have already stated, that it has affected both the Austrian and Prussian armies, our readers will be prepared to hear that the Italian forces have not escaped. We have to acknowledge our obligation to our Italian friends, who have supplied us with the most trustworthy information, of which we shall always be glad to avail ourselves. To begin with Naples, a city which, as those who have visited it will readily believe, must, in its present state, afford a most fertile field for the disease, we may state that for the last two months cholera has been the daily talk of the population, and for more than a month before our contemporaries announced

that Itay was unvisited. Official figures had been issued of the mortality, and most stringent regulations enforced with a view of preventing its increase. Unfortunately Naples, with all its beauty, is still deficient in good water, as well as efficient drainage. The lower classes of the inhabitants are pre-eminent for their neglect of cleanliness, and those who are really more enlightened are most apathetic on all sanitary matters. Thus, beneath an ever smiling sky, in a city supreme in Europe for its picturesque loveliness, the most pestilential smells assails one at every step, and indicate too plainly the unwholesomeness of even the finest quarters. Even in the finest hotels in the Chiaia we have seen cess-pools in the centre of the court-yard, around which the rooms are built, and have experienced the ill-effects of their being opened while we were living in the hotel. Until some of the most obvious wants of the city are supplied it will remain a tempting field for cholera, as well as a host of other diseases.

The following are the statistics that have been officially certified by the municipal authorities. Each day terminates at noon, counting from noon of the preceding day :—

	Cases.	Deaths.
July 31st ...	1	1
Aug. 1st ...	0	0
" 2nd ...	0	0
" 3rd ...	2	0
" 4th ...	0	1
" 5th ...	0	0

" 26th ...	52	24
" 27th ...	48	31
" 28th ...	51	37
" 29th ...	—	—
" 30th ...	—	—

More recently the figures have been considerably increased, and on the 6th the *Tonis* issued a telegram announcing 115 cases, and 85 deaths in the preceding day. The disease has appeared in the barracks as well as in the town and suburbs, and, as early as the middle of the month, five cholera hospitals were prepared, and the medical men ordered to report all new cases they might see.

GENOA.—It is impossible to afford space for a similar detailed report, suffice it that, although our contemporaries announced among their latest news of cholera, no cases up to September 1st, there were actually 32 cases, of which 17 had been fatal, before the 21st August. On the 25th August, just one week prior to the statement, there were 41 new cases and 26 deaths registered as due to the disease. The day before there had been 25 cases and 16 deaths.

Last Thursday 35 new cases and 27 deaths were registered. We have said enough to show the state of the Peninsula without referring to other towns, from which we hear gloomy accounts.

The following table exhibits at a glance the distribution of the epidemic during a week of unusual interest :—

Day ...	Daily Returns of Deaths Registered from											
	CHOLERA.					DIARRHŒA.						
	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Sun. & Mon.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Sun. & Mon.
Date ...	28	29	30	31	1	2 3	28	29	30	31	1	2 3
All London ...	31	29	29	21	35	30	23	22	16	17	22	34
W. Dis. ...	1	...	2	1	1	5	...	2	...	3	5	5
N. Dis. ...	2	1	1	3	5	2	2	3	3	3	5	4
C. Dis. ...	2	...	2	1	1	2	3	3	3	3	3	3
E. Dis. ...	22	22	20	9	13	12	13	8	8	7	3	15
S. Dis. ...	4	6	4	7	15	9	5	6	2	4	2	7

On Sunday and Monday, the 2nd and 3rd September, together, the total deaths from the epidemic, and the districts in which they took place, are displayed :—

	Population Estimated to middle of 1866.	Total Births.	Total Deaths.	Deaths from Cholera.	Deaths from Diarrhœa.
London	3,037,991	430	229	30	34
West Districts.....	511,258	61	36	5	5
North Districts.....	686,021	87	33	2	4
Central Districts.....	359,219	61	21	2	3
East Districts.....	607,945	97	78	12	15
South Districts.....	873,548	124	56	9	7

It should be remembered that these figures are for two whole days.

LIVERPOOL.—Notwithstanding the decrease we noticed last week, the epidemic again shows a serious increase for the week ending September 1. Of the 592 deaths registered during that week, exceeding by 282 the average of the corresponding week of ten previous years, corrected for increase of population, 225 were referred to cholera, 78 to diarrhœa, 29 to whooping-cough, 20 to scarlatina, and 12 to typhus. The fatal cases of diarrhœa have been nearly stationary during the last few weeks, while those of cholera have been respectively 45, 87, 101, 126, 157, and 146, and last week 225.

DUBLIN.—In Dublin the 147 deaths returned last week included 41 from cholera, although the mortality of that city from all causes scarcely exceeds the average. Vienna has been through the summer almost free from the disease, but in the return for the week ending 18th ult., 16 of the 366 deaths are referred to this head.

METEOROLOGY OF AUGUST, 1866.

MR. ALLNATT of Frant, near Tunbridge Wells, has published the following analysis of the weather of the last month, which is particularly interesting in connexion with the Cholera :—

ANALYSIS.

Cloud.—Not one purely cloudless day existed during the month. The predominant modification was the cirro-cumulo stratus, which by the action of solar heat and the earth's radiation upon its dynamic forces became as the day advanced frequently insulated in separate strata, and gradually passed off to be replaced after sunset by ponderous radii of cirro-stratus in N. W. On the 17th masses of cumulus in two strata formed rack and scud, and on the 25th cirro-cumuli appeared in undulating waves spread uniformly over the sky. On the 26th elements of the same cloud-form existed in separate strata, the cirrus apparently without motion, and the cumulus below was borne rapidly by earth's wind current.

Wind.—On the 6th, 7th, 8th, and 9th cold high tem-

pestuous winds blew from S. W., sometimes with the force of a hurricane. On the 16th and 17th tropical gales again prevailed, which produced considerable damage on the west coasts. The predominant wind was from S. W.

Barometer.—Atmospheric variations were frequent, but limited in their action. The highest point was reached on the 25th and 26th—viz., 29.72 in.; and the lowest on the 22th, 29.00 in., so that the entire variation was below an inch.

Thermometer.—The mean temperature of August is calculated at 60.13 deg., and up to the 19th it was considerably below the standard; on the 20th, however, a change occurred, when the temperature rose and registered consecutively above the average until the 29th. The highest morning reading (at 10 o'clock) on the 24th was 75 deg., and the lowest on the 4th, 52 deg. The range, therefore, was 23 deg. The highest night reading was 59 deg., and the lowest 48 deg.; range, 11 deg. *Maximum* divergence between night and morning temperature, 27 deg.

Rainfall.—The recognized mean of August is 2.94 in. This year, however, it has been below the average by 0.15 in.

Hygrometer.—There was fair balance of humidity; the average was about 20 per cent. of atmospheric moisture. On the 24th complete saturation occurred, and the foliage of the high trees poured down its accumulated condensation in complete showers.

Lightning and Thunder.—On the 16th a violent thunder-storm broke over the north of England, accompanied by torrents of rain mixed with hail and conical fragments of ice in various stages of congelation. The country near Aberdeen was flooded, trees were stripped of their foliage, and several cattle were killed by the lightning. The elemental conditions in the S. betoken great perturbation—rack and scud, depression of barometric tension, high and squally wind, and heavy rainfall. On the night of the 26th thunder and lightning in the S. gave evidence of a storm passing at a distance.

Meteors.—The autumnal epoch of meteors seem to have passed away this year without its wanted display. On the evening of the 8th a beautiful meteor, of enormous magnitude, is reported as having appeared at Bell's Yew-green, near Frant. It left a long, luminous train during its passage from N. to S., and faded gradually as it approached the earth. On the night of the 27th, as will be seen by the table, a bright asteroid fell into the west.

Halos.—Soon after noon on the 19th a chromatic solar halo of unwonted beauty was visible, which exhibited with peculiar distinctness prismatic colours. At 11 a.m. wind currents had crossed each other in diametrical opposition. At noon the whole south was filled with streams of radiant cirri, and these, floating over the sun's disc, produced the halo, which, from its altitude, was almost spherical. Its area contained a blue lenticular cirro stratus which projected in radii beyond the periphery of the arc; below were masses of attenuated cirro-cumulus. The day was calm and sultry, wind intermittent from S. to N. On the night of the 23rd a mass of high atmospheric cirro stratus produced an ovoid lunar halo of large circumference, the inferior segment of which swept within a few degrees of the S. horizon; and the corona of the superior arc reached within 4 deg. of the zenith; and on the 25th the moon was surrounded by a large halo, comprehending within its sphere a series of beautiful transparent orange-coloured corona as successive waves of cirro-cumulus swept over the disc.

Ozone.—The 10th, 15th, 22nd, 29th, and 30th were periods of antozone. On the nights of the 22th and 30th the test slips were almost bleached, but before noon they regained by speedy action of ozone their lost colour. During the months of July and August last year the development of ozone was very limited, and considerably below the register of the same months of the present year. The comparative analysis shows a balance in favour of the recent months of nearly 30 per cent. upon the aggregate amount. This in relation to the present epidemic is a suggestive fact, and it would be important to ascertain by statistics of practical ozonometry if any perceptible diminution of reaction has been observed in the most infected cholera districts. At present our observations are founded on exceedingly hypothetical date.

Blue Mists.—This recurrent phenomenon, which by Mr. Glaisher has been deemed pathognomonic of epidemic cholera, existed here more or less at intervals throughout June,

July, and August. Observed from this altitude, it has often merged into the common neutral gray; indeed, it almost invariably assumed that hue in conjunction with the blue when viewed through the intervening medium of an extensive landscape. The coincidence of its existence with the epidemic is certainly curious; but have we not its analogue in the *collina*, or dry fog, of Southern Spain, which appears to be almost identical in its physical characteristics. This *collina* shows itself in June, and lasts till the middle of August, when the temperature has reached its *maximum*. Objects seen through it look exactly as though they were enveloped by transparent lead-coloured gauze. It exerts no influence over the hygrometric condition of the air, and as in all probability it is produced by the mutual antagonism of telluric and atmospheric electricity, it is not dissipated even by the force of powerful wind currents.

Proceedings of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, JUNE 26TH, 1866.

Dr. JAMES ALDERSON, F.R.S., President.

ELEPHANTIASIS ARABUM, OR ELEPHAS, SUCCESSFULLY TREATED BY THE APPLICATION OF A LIGATURE TO MAIN ARTERY OF LIMB; WITH REMARKS.

By THOMAS BRYANT, F.R.C.S.,
ASSISTANT-SURGEON TO GUY'S HOSPITAL.

THE author having made some general remarks on the disease, related a case of elephas, which occurred in the person of Mary T., aged 25, a native of Carmarthen, the daughter of Welsh parents, who was admitted into Guy's Hospital under his care on October 10th, 1865. She was a single woman, of healthy aspect, and had always enjoyed good health, never having had any illness of much importance. Ten years previously she had scarlet fever, which was unaccompanied by any of its ordinary complications; and it was during her convalescence from this disease that her left leg began to swell, the swelling beginning in the calf and extending upwards towards the knee; it was unattended by pain or any indication of general disease. For two years the enlargement was gradual, when she slept in a damp bed, and after this the disease progressed more rapidly, and extended upwards to the thigh. This increase was still, however, perfectly painless. She was subsequently admitted into the Carmarthen and Swansea Infirmary, where all kinds of treatment were tried, but without success, the disease gradually progressing. Three years since, some small ulcers appeared in a deep sulcus in the calf, from which a quantity of dark fluid like blood escaped; the ulcers subsequently healed.

On admission the left leg was found to be enormously enlarged from the ankle to the groin. To the hand it felt hard and brawny, the skin and cellular tissue being evidently infiltrated with a fibrous material. Several deep sulci also existed between the folds of integument in the calf. The skin appeared to be coarse, but it was free from the cuticular induration and ulceration which is so frequently associated with this affection. It was also noted that the foot was perfectly sound. The measurements on admission were as follows:—Round the left or diseased calf, 24 in.; round the right, 15½ in.; round the diseased thigh, 28 in.; round the right, 21 in. The temperature of both limbs appeared to be alike. The pulsation in the left iliac artery was clearly to be felt; but the femoral and tibial vessels of the affected limb could not be made out. The patient was kept in bed for three weeks, with the leg well raised on an inclined plane. In the first week the calf had diminished an inch and a half, and the thigh one inch, all œdema having subsided; but after that date no further decrease took place. On the 31st of October the external iliac artery was ligatured, the patient being under the influence of chloroform. The vessel ap-

peared to be perfectly healthy, and of normal size. The whole limb was subsequently swathed in cotton-wool, and raised as before. The subsequent progress of the case was one of uninterrupted success. The limb rapidly became softer and smaller, the calf measuring at the end of the week $19\frac{1}{2}$ in., and the thigh 24 in., being three inches less than it was on the day of operation. At the end of the second week the limb had diminished another inch; and on the fifteenth day the ligature came away from the iliac artery, the limb all this time having been free from pain, and quite warm. By the 30th November the wound had quite healed, and the patient's health was very good. By the 30th December the calf had become reduced to $18\frac{1}{2}$ in.; by Jan. 31st it measured $16\frac{3}{8}$ in.; by Feb. 21st it was only $15\frac{1}{2}$ in.; and on March 15th it measured $15\frac{1}{2}$ in., being but three quarters of an inch larger than the sound limb. The skin had gradually contracted, and had become natural in its aspect; all brawniness of the limb had also gone. The patient at the present date is walking about with an elastic legging, perfectly sound.

In his remarks, the author referred to Dr. Carnochan's cases, which were published in 1856, and stated that it was from their perusal that he had been induced to adopt the practice illustrated by the case he had detailed. He then gave a brief outline of Dr. Carnochan's four cases, in all of which a good result was obtained. He alluded to a case of solid œdema of the foot operated upon in 1858 by Mr. Statham, and gave a brief outline of Mr. Butcher's case published in 1863. He quoted also an example of Dr. Fayrer of Calcutta, and of Mr. Alcock of the North Staffordshire Infirmary. He then passed on to consider the pathology of the affection, with the microscopical appearances of the structure involved. He alluded to the theory that it was a disease of the veins of the part, and referred to the fact, illustrated by his own case, of the foot being free from the albuminoid infiltration as an argument against the "venous" theory. He quoted Dr. Carnochan's opinion, that it was due to a morbid condition and dilatation of the principal arterial trunk of the member affected, and pointed out the fact that this condition was present in only one of the cases related. He then described the pathological condition of a limb the subject of this affection, with its microscopical appearances, and pointed out that it was apparently a disease of the cellular tissue of a part, and that it was essentially due to an infiltration of fibro-plastic elements; the elementary structure of a fibro-plastic tumour and of elephas being identical, excess of nutritive material and of organizable products being present in both. Under such circumstances he asserted that the principle of the operation which had been performed must be looked upon as rational, and the practice based upon it as scientific; for if the disease of elephas be due to an abnormal effusion of tissue-making elements, to an excess of nutrition in a limb, the attempt to check its progress by the application of a ligature to its main artery, by which it lives, must be regarded with favour. But whatever the theory of the practice may be, he proved that the practice itself was a good one, for the success of the cases he had brought before the notice of the Society was clear and unequivocal. They tended to show that a new means had been given to the surgeon to cure a loathsome and hitherto incurable affection, and another triumph had been achieved for the science and art of surgery.

Dr. WEBSTER said elephantiasis was a very common disease in Brazil. He referred to the very large size limbs affected by it attained. He remarked, too, on the fact that Mr. Bryant's patient had never been abroad, and on the novel treatment of the case.

Mr. LEE asked if there was any reason to suppose that there was disease of the arteries in this case.

Mr. GASKOIN said that cases of elephantiasis were of great interest. There was a question as to the identity of elephantiasis with elephas. Some say it is not a disease of the skin. No doubt it was a blood disease, and the point of chief importance was to know if the anatomical characters were alike in elephas and elephantiasis. In

elephantiasis the bloodvessels were diseased and cartilaginous. Amputation and ligature of arteries were not always successful.

Mr. HULKE said it would be interesting to know if the changes in the arteries had been observed by Mr. Gaskoin himself. In the specimens examined by the Pathological Society no changes had been observed.

Mr. GASKOIN gave reference to statements by authors on the subject.

Mr. BRYANT said the case he had operated on was elephantiasis Arabum, and not elephantiasis Græcorum. He again referred to Dr. Carnochan's operation, and said that although Dr. Carnochan was led to perform the operation on the hypothesis that there was arterial disease, further cases showed that disease of arteries was usually not present. However, the practice seemed good, although the theory that led to it was not tenable.

Dr. GREENHOW said the Committee at the Royal College of Physicians quite agreed that elephantiasis Græcorum and elephantiasis Arabum were quite different diseases. One was a blood disease, the other was local.

ACCOUNT OF A CASE OF OBLIQUE INGUINAL HERNIA ON EACH SIDE, IN WHICH, THE TESTES REMAINING IN THE BELLY, THE HERNIAL SACS DESCENDED INTO THE SCROTUM, AND ALSO ASCENDED UPON THE APONEUROSIS OF THE EXTERNAL OBLIQUE MUSCLE.

By J. W. HULKE, F.R.C.S.,

ASSISTANT-SURGEON TO THE MIDDLESEX AND ROYAL LONDON OPHTHALMIC HOSPITALS.

A man, aged 27, was admitted into the Middlesex Hospital with strangulated hernia January 20th, 1865. The right side of the scrotum was filled with a large irreducible globular swelling, which also reached upwards along the groin to the anterior superior iliac spine. This latter part of the hernial swelling was superficial to the aponeurotic tendon of the external oblique muscle. There was a similarly-placed hernia on the other side, not strangulated. The symptoms of strangulation were very acute. Herniotomy was performed three hours after their commencement, but the patient died next day of peritonitis. The right testis was found in the belly: the left hung freely in the inguinal canal, from a mesorchion derived from the parietal peritoneum near the internal abdominal ring.

In reply to Mr. John Wood, Mr. HULKE said both the testes were free and undeveloped.

THE INFLUENCE OF ALCOHOL ON THE TEMPERATURE OF NON-FEBRILE AND FEBRILE PERSONS.

By SYDNEY RINGER, M.D.,

PROFESSOR OF MATERIA MEDICA AT UNIVERSITY COLLEGE, AND ASSISTANT-PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL;

AND

WALTER RICHARDS, M.D.

In this paper the authors give the results of some observations on the influence of alcohol on the temperature of non-febrile and febrile persons, and a few on rabbits. The authors gave alcohol in poisonous doses to three non-febrile adults. The temperature was greatly depressed in two. The depression amounted to 3° Fahr. In the third case the temperature was but little influenced. The subject of this observation was a confirmed drunkard. He confessed to getting drunk whenever he had the opportunity.

Alcohol was also injected into the rectum of two rabbits. In both the temperature was considerably depressed. The depression amounted to 15° Fahr.

The authors therefore conclude that alcohol in poisonous doses causes a very considerable depression of the temperature of the body of non-febrile persons, and also that it is probable that habit obviates this effect. Further proof in favour of this latter conclusion is given in a subsequent part of the paper.

The rapidity of the fall of the temperature after death of two patients and one rabbit was ascertained. This is

compared with the rapidity of the fall of the temperature after the use of alcohol. It was found that the temperature falls as rapidly after the use of alcohol in poisonous doses as after death. The circumstances determining the cooling of the body, however, differ in the two conditions. Thus during life much heat is carried off by the air inspired into the lungs. Assuming that the cooling effects of respiration are equal to those that result from radiation from the surface of the body, it follows that alcohol possesses the power to diminish by one-half those processes that produce the heat of the body.

Both of the patients whose temperature was depressed suffered from nausea and vomiting. In order to ascertain if the depression of the temperature were due to the conditions that accompany vomiting, tartar emetic was given to a patient every ten minutes, and continued long after vomiting was produced. The administration of the anti-mony was continued seven hours. No depression of the temperature resulted. Thus the authors conclude that the depression of the temperature was not due to the vomiting produced by the alcohol.

Alcohol was next given, in ordinary doses, to non-febrile persons. Eleven observations were made. In eight the temperature was depressed. In three cases the temperature was unaffected. These three persons were strong adults. The quantity of alcohol given them was small (an ounce of brandy). Two of them were confessed free drinkers. The amount of depression was slight. The authors thus conclude that alcohol, when taken in ordinary quantities by non-febrile persons, causes a slight depression of the temperature of the body, but that the amount of depression which occurs is too slight to contraindicate its use.

Numerous observations were made to ascertain the influence of alcohol on the temperature of febrile persons. To some of the patients very large quantities of alcohol were given. To a child of twelve years old eleven ounces of absolute alcohol were given on one day. From these observations the conclusion is drawn that ordinary and extraordinary quantities of alcohol cause only a slight and temporary depression of the temperature of febrile persons, and consequently alcohol cannot bring the temperature of febrile patients to that of health. But if alcohol should be indicated by the general condition of the patient, it will also to some extent act beneficially in virtue of its power to cause some diminution of the temperature of the body.

Some observations were made to ascertain the influence of alcohol on the pulse. From these the conclusion is drawn that alcohol increases the force of the pulse, but lessens its frequency.

In conducting these observations the following precautions were taken: the patients were kept in bed; all the conditions were kept the same; the thermometer was kept the whole time in the axilla, and the temperature was noted every few minutes. The observations were continued many hours—in some cases during the entire day.

ACCOUNT OF A SECOND CASE IN WHICH THE CORPUS CALLOSUM WAS DEFECTIVE.

By J. LANGDON H. DOWN, M.D.,

ASSISTANT-PHYSICIAN TO THE LONDON HOSPITAL, AND PHYSICIAN TO THE ASYLUM FOR IDIOTS, EARLSWOOD.

This was another instance of extensive deficiency in the great commissural connexion of the hemispheres of the brain, associated with marked imperfection of the intellectual faculties, similar to the case recorded by the author in vol. xlv. of the "Transactions" for 1861. The rarity of the abnormality was indicated by the fact that this was only the second time the author had met with it in the dissection of 150 brains of idiots.

Dr. SANKEY said the case illustrated the facility with which causes were attributed. The mental defect in each case had been put down to masturbation, when it merely depended on congenital malformation.

The Society then adjourned.

HOSPITAL CHARGES AGAINST THE CANADIAN VOLUNTEERS.

The *Army and Navy Gazette* of 1st September remarks as follows on this subject:—

"Some weeks back we noticed what was represented to us as the neglect to provide the Canadian Volunteers with proper equipments when they were sent into the field to resist the Fenian invasion. We have since inserted a contradiction of these statements, but now another cause of dissatisfaction is reported to us. Great indignation has been excited in Canada by hospital charges being sent to the commanding officer of the 13th battalion of Volunteers, by the Imperial military authorities for the care of the Volunteer wounded at Ridgway, amounting in some instances to more than their pay and allowances, and we are told the pay of the whole battalion was refused by the Colonial Government until these charges were paid. Had there not been a relief fund for the Volunteers, subscribed by the people of Hamilton, the officer commanding the 13th battalion would have been obliged to pay these charges before he could have drawn the pay for his men. The committee having charge of the expenditure of this fund did pass an order for the amount, very reluctantly, however, to a certain extent acknowledging a claim of such an extraordinary character. We need not say that it is customary in the British Army to make hospital charges against the men, but the case is different in Canada. The Canadian Government pays the Volunteers, and allows them half-a-dollar per diem (two shillings sterling) when they are in the field, and not provided with rations or barracks, the military authorities charged the whole of this to the wounded, and as some of them did not recover until after their regiment was off duty, the charges have amounted to more than all the pay and allowances coming to them; and money supplied by the Canadian Exchequer is paid into the Imperial Treasury. It was still worse when the Volunteers had an hospital of their own, from which they were removed by order of the Imperial authorities. As there is every probability of another and more formidable Fenian invasion before long, it is to be hoped that the British Government will remove such just grounds of complaint."

THE NAVY MEDICAL DEPARTMENT.

The *Army and Navy Gazette* of September 1st thus deals with this subject in a leading article:—

"On the return of the Director-General of the Medical Department of the Navy from a short leave of absence, it is expected that the Board of Admiralty will immediately take the necessary steps to amend the Circular issued by the Duke of Somerset for the improvement of the position of the naval medical officers. It was certainly hoped that by the concessions which had been made by the late Order in Council the objections entertained by the present rising generation of medical men against entering the naval service of their country would have been removed or at least materially lessened. We and others have been much mistaken. There is evidently a kindlier eye turned from the schools to the Navy, but that is all. There is no evidence of any intention on the part of likely recruits to present themselves at Somerset House, and it is our conviction that nothing of the kind will take place until the *mét d'ordre* is given out by the heads of their profession to their younger brethren, and when this is once done we shall have no anxiety as to the result. Sir Alexander Milne is now in power. When he acted as chairman of the late First Lord of the Admiralty's Committee he was only permitted to suggest. The scene is changed; he can at present not only originate but carry out a substantial reform. These are not times for half measures. The medical question should be dealt with by itself. A great error was committed when the lately issued Circular was compiled, in mixing up matters connected with other branches of the profession. What necessity was there to drag in the paymasters and engineers? These officers did not feel complimented, although very likely the clauses relating to them were framed in a very conciliatory spirit. Enough has been said and written to prove that the step taken by the late Board, although in the right direction, has fallen far short of the expectations and wishes of those on whom the country depends for a supply of the right description of medical men. This being an ad-

mitted and incontrovertible fact, Sir John Pakington and his colleagues must energetically set to work to repair the error, so that when the time arrives, whenever that may be, for them to make room for their successors, they may point with satisfactory pride to an efficient and contented body of naval surgeons."

Medical News.

UNIVERSITY OF LONDON.—Examination for Honours.—*Anatomy*: 1st Class, J. Stanton Cluff, B. A. Dubl. (Exhibition and Gold Medal), University College; Frederick Taylor (Gold Medal), Guy's Hospital.—*Physiology, Histology, and Comparative Anatomy*: 1st Class, James Stanton Cluff, B.A. Dubl. (Exhibition and Gold Medal), University College; 2nd Class, John James Ridge, St. Thomas's Hospital; 3rd Class, Tempest Anderson, University College.—*Organic Chemistry and Materia Medica and Pharmaceutical Chemistry*: 1st Class, J. Stanton Cluff, B.A. Dubl. (Exhibition and Gold Medal), University College; Frederick Taylor (Gold Medal), Guy's Hospital; 2nd Class, Tempest Anderson, University College; 3rd Class, John James Ridge, St. Thomas's Hospital; William Warwick Wagstaffe, B.A. St. Thomas's Hospital.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—At the Quarterly Examination held on the 14th of August the following gentlemen passed their First Examination for the Letters Testimonial of the College—viz:—

Allt, N. W.	Mara, W. F.
Anderson, J. A.	Mitchell R.
Armstrong, J.	Moylan, M. T.
Brown, T. J.	McDermott, W. M.
Boland, H. F.	McMulleir, W. A.
Birney, A.	Mullins, E. A.
Beatty, J. G.	Nugent, E. J.
Burkitt, J. M.	O'Gorman, E.
Carey, R. B.	Owens, G. W.
Carey, S. O.	Pearsall, W. B.
Cordner, L. M.	Ridley, J.
Curren, E.	Riddick, J.
Daly, G. W.	Riordan, H. de B.
Dwyer, J.	Robinson, W.
Egar, O. S.	Ryan, J. P.
Evans, R.	Samuels, W. F.
Finley, J.	Scott, J. H.
Gavan, M. F.	Shaw, G.
Harris, S.	Smallman, R.
Hart, J. P.	Smith, H. L.
Hatchell, G. W.	Wade, N.
Hudson, R. P.	Wallis, J.
Hurley, J. J.	Walsh, P. V.
Huston, R. T.	Warren, W. H.
Irving, G. C.	White, W. D.
Kellett, S.	

At the Quarterly Examination held on the 21st of August, the following Gentlemen passed their Second Examination for the Letters Testimonial of the College and were admitted Licentiate—viz:—

Anderson, J. A.	Nugent, E. J.
Barker, F. C.	Olden, D.
Barker, J. C.	Owens, G. W.
Beatty, J. G.	Parks, R.
Brown, T. J.	Pearsall, W. B.
Burkitt, J. M.	Riddick, J.
Carey, R. B.	Ridley, J.
Carr, F.	Ryan, J. P.
Drew, J. B.	Samuels, W.
Gavin, M. F.	Scott, J. H.
Harris, S.	Shaw, G.
Hart, P. J.	Smallman, E.
Hatchell, J. H.	Smith, H. L.
Hudson, R. P.	Stokes, G. P.
Hurley, J. J.	Thompson, H. G.
Irving, G. C.	Wade, N.
Kcelan, O. C.	Walsh, P. V.
Mitchell, R.	White, W. D.
McConaghy, C.	Wodsworth, C.
McConaghy, W.	

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND), FOR THE MONTH OF AUG., 1866:—

Henry Beatty, Cappy House, Lisbellaw, Co. Fermanagh, L.R.C.S.I. 1865; L.R.C.P. Edin. 1866.
 Harry Molony, Ennis, Co. Clare, L.F.P. & S. Glasg. 1866; L.R.C.P. Edin. 1866.
 Campbell Fair, Oughterard, Co. Galway, M.R.C.S.Engl. 1866; L.K.Q.C.P.Irel. 1866.
 Charles McDonnell, Shanagolden, Co. Limerick, L.R.C.P. Edin. 1866; L.F.P.S.Glasg. 1866.
 Richard John Kinkead, Tuam, Co. Galway, L.R.C.S.I. 1865; L. in Midwif. R.C.S.I. 1865.
 George Newman Dunn, Delgany, Co. Wicklow, L.K.Q.P.Irel. 1866; M.R.C.S.Engl. 1866.

APOTHECARIES' HALL.—The following gentleman

passed his examination in the Science and Practice of Medicine, and received a certificate to practise, on Aug. 30th:—
 Charles Read, Falmouth.

The following gentlemen also on the same day passed their first examination:—

Charles Henry Furnivall, Westminster Hospital; Alfred Kelly, King's College Hospital; Frank Henry Laking, St. Georges's Hospital.

THE DEVONPORT NAVAL HOSPITAL.—On the 4th instant, the Board of Admiralty visited the Devonport Royal Naval Hospital. They were received by Captain Codd, Dr. Stewart, Dr. Beith, and Dr. Duirs. Their lordships "walked" the hospital, where some improvements suggested themselves. Sir John Pakington made several inquiries of Dr. Stewart as to the accommodation, and expressed satisfaction at the good order and cleanliness everywhere displayed.

NEW YORK STATE INEBRIATE ASYLUM.—Up to 1864 there had been 7245 applications for places in this institution at Binghamton, from every State in the Union, and from Europe, Mexico, and the British Provinces, 520 of whom were opium eaters. There were 39 clergymen, 8 judges, 197 lawyers, 226 physicians, 340 merchants, 680 mechanics, 466 farmers, 240 gentlemen, and 805 women. One of the opium eaters, a lawyer, who had filled a highly responsible office, in one year drank 3200 bottles of McMunn's preparation of opium. In one day he drank twenty bottles, equal to ten thousand drops of laudanum. Patients at this asylum are received for not less than a year, are watched, controlled, and medically treated. The expectation is that at least 70 per cent. will be radically cured. It was stated at the recent Temperance Convention at Saratoga, that the names of 1300 rich men's daughters are on the list of applicants for admission to this asylum.

A NEW FOSSIL REPTILE.—M. d'Archiac lately laid before the Academy of Sciences the remains of a fossil reptile found by M. Frossard, a Protestant clergyman, in the bituminous schistus of Muse, near Autun, Saône-et-Loire. The new reptile belongs to Owen's Ganocephali, strange vertebrata, with uncertain characteristics, seemingly representing the embryo age of reptile, just as the Ganoids with vertebra incompletely ossified represent the embryo age of fishes. The new fossil is to be called *actinodon*.

PRESERVATION OF MEAT.—A new process for preserving fresh meat has been patented by Messrs. McCall and Sloper, who are at present at Buenos Ayres employed in making experiments on a large scale. They profess to be able to preserve meat in its fresh and raw state so as to reach England from South America in the exact condition of butcher's meat just killed, at a cost of from fourpence to fivepence per pound. Their curing process is simple, and is based on the exclusion of oxygen from the vessel in which the meat is packed.

DR. LETHEBY, Medical Officer of the City of London, complains to the Commissioners of Sewers that he is unable to make any proper return of the condition of choleraic diseases in the City, because the guardians of the City of London Union refuse to furnish him with the returns from their districts on the ground "that it was useless, and would cause trouble." Here, again, it seems that the local authorities are at odds, and the guardians amuse themselves by systematically snubbing the medical officer of health, who is an officer of the Commissioners of Sewers. They have not only refused to supply these returns, but instead of consulting him on the Order in Council of the 21st of July in respect of sanitary measures, as they were directed to do, they have set to work to issue their own notices, including some of the most remarkable directions for disinfection that were ever devised. Altogether, the folly of the guardians is likely to be so hurtful to the public interest that the President of the Privy Council has found it necessary to interfere, and the guardians have been requested to supply the necessary information. All except those of the City of London Union have complied, and by an omission in the "Nuisance Removal and Prevention Act," they are able to interpose some vexatious opposition.

STAFF SURGEONS.—It is far from probable that the present Board of Admiralty will permit their power of giving the rank of Staff Surgeon to officers who have not served twenty years to remain a dead letter. Such a reward

for meritorious service is much coveted, has been well deserved by many surgeons on the list, and we shall hail with much pleasure the first such promotion that we may have to chronicle. Just at the present moment, when medical men are so very "backward in coming forward" to enter the Navy, we think the carrying into practice of the Circular of July 12, 1866, on this point would have a decidedly good effect, and it is satisfactory to know that the gift of such rewards is in the hands of Sir John Pakington and his present colleagues.—*United Service Gazette.*

THE guardians of the Greenwich Union have determined to allow the medical officer an assistant, and to provide the drugs, &c., instead of requiring them to be furnished by the house-surgeon.

THE Commissioners despatched to the lazarets and field hospitals by the Patriotic Help Association (Hilfsverein) of Vienna, have just published a long and interesting report.

DR. W. TYNDAL ROBERTSON will edit and revise the report about to be published of the transactions of the British Association at Nottingham.

THE Board of Guardians of the Strand Union have declined by a large majority the services of lady nurses.

FROM the report of the London Dwellings Society (Limited) it appears that their capital has increased to £24,800.

No less than 1100 Prussian soldiers have died of cholera at Brunn in the course of the last two months.

GLASGOW MEDICO-CHIRURGICAL SOCIETY.—At a Meeting of the Medico-Chirurgical Society, held in the Hall of the Faculty of Physicians and Surgeons, St. Vincent-street, on Tuesday, 4th September, the following gentlemen were elected Office Bearers, viz.:—*President:* Dr. Allen Thomson. *Vice-Presidents:* Dr. Robert Patterson; Dr. Coates. *Council:* Dr. Naismith, Hamilton; Dr. W. T. Gairdner; Dr. Yeaman; Mr. Robertson, Renfrew; Dr. Dewar; Dr. Tindal; Dr. G. H. B. Macleod; Dr. A. R. Simpson. *Secretaries:* Dr. James Adams; Dr. Robert Perry. *Treasurer:* Dr. H. R. Howatt.

SINGULAR SUICIDE BY A SURGEON.—On Tuesday an inquest was held at the London Hospital respecting the death of a surgeon, named John Baker, who had committed suicide. The evidence showed that deceased had for some time lived apart from his wife, because of her great intemperance, and occupied lodgings in Ray's-street, Bethnal-green. On last Wednesday evening he visited his wife, and then seemed very much depressed, which was not, however, an unusual thing with him. He must have drunk freely after leaving his wife, for when he got to his lodgings he was in a very intoxicated state. On the following afternoon he went out, and at about eleven o'clock at night he went to the Mile-end station, and asked the inspector how soon there would be a train for the city. The train came up shortly after, and he then said he would wait for the next, as that would be a twopenny train. Just as that which was at the station started, he jumped from the platform and threw himself on the rails. The engine, which was only two yards off, passed over him, and so did all the carriages, and yet when he was picked up he was still alive and sensible. In answer to a question, he said it was "trouble" that caused him to do as he had done. He was taken to the hospital, and died there in a few hours. The jury found that he had committed suicide whilst of unsound mind.

SISTERHOOD NURSES.—At a meeting of the Guardians of the Strand Union, the question of allowing the sisters of the All Saints' Home, Margaret-street, to give their gratuitous services in nursing the sick poor in the house, was introduced. Mr. Corbett, Poor-law Inspector, bore testimony to the advantage which the Chorlton Workhouse had derived from the sisters at a time of panic, when no other nurses could be obtained. The proposal was shelved, the general feeling of the board appearing to be against the introduction of the sisters as nurses.

DR. HERZ of Vienna strongly urges, in the *Wien. Med. Woch.*, on his medical brethren, the benefits of village hospitals, as adopted in England. He especially speaks of the Cranley Hospital.

Notices to Correspondents.

Mr. Robert Perry.—The notice has been received.

Dr. T. Orme, Duñaid.—The Report has been received.

Dr. A. Lane.—When the decision of the Lords of the Admiralty has been made known as to the merits of the medicine, we shall be in a position to discuss the subject.

Observer.—The statements contained in the publication alluded to are quite unworthy of notice.

M.D.—The Report has been received.

Reply to a Dispensary Doctor.—As you have suggested yourself—"leave it alone for five or six months to see the result." The probability is that there is no "narrowing of the lachrymal duct," nothing but temporary obstruction from tumefaction. Avoid all irritation, even by wiping the eye.

Appointments.

The Lord Lieutenant of Ireland has been pleased to appoint Dr. W. Malachy Burke, 12, North Great George's-street, Physician in Ordinary to his Excellency.

JOHN CAMPBELL, Esq., M.D., has been appointed by the Postmaster-General, the Duke of Montrose, as Medical Adviser for the Lisburn District, under the Government Insurances and Annuities Act.

S. ARCHER, Assistant-Surgeon, 95th Foot, to be Staff-Assistant-Surgeon, vice G. Traynor.

J. K. CARR, Surgeon, M.D., 32nd Foot, to be Surgeon-Major, having completed twenty years' full-pay service.

M. COMBE, Surgeon, M.D., Royal Artillery, to be Surgeon-Major, having completed twenty years' full-pay service.

W. GRANT, Surgeon, M.B., 87th Foot, to be Surgeon 1st Foot, vice C. W. Woodroffe.

C. W. WOODROFFE, Surgeon, 1st Foot, to be Surgeon 87th Foot, vice W. Grant, M.B.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

On the 7th ult., at the Curragh, the wife of Surgeon J. O. Cunningham, M.D., 60th Royal Rifles, of a son.

On the 8th ult., at 27, Harcourt-street, the wife of Henry Gray Croly, Esq., F.R.C.S.I., of a daughter.

On the 8th ult., at 23, Stephen's Green, North, the wife of Surgeon Morgan, of a daughter.

DEATHS.

On the 18th ult., at Haworth, E. S. Hall, M.R.C.S.E., aged 57.

On the 20th ult., at Grange-road, Bermondsey, J. Todd, M.D., aged 45.

On the 22nd ult., at Storrington, Sussex, F. D. Mudd, M.R.C.S.E.

On the 22nd ult., at Woolston, Southampton, S. Summers, M.B.C.S.E., aged 46.

On the 24th ult., at Gateshead, F. Bennett, F.R.C.S.E., J.P., aged 59.

On the 27th ult., at Wood-green, London, after a short illness, Alfred Joseph Humby Banks, M.D., aged 40.

On the 28th ult., at Dorrington, Salop, formerly of Longden, S. Glover, Surgeon, aged 79.

On the 28th ult., at Old Kent-road, C. Leonard, M.R.C.S.E., aged 64.

On the 31st ult., at Knighton, Henry Warren, Surgeon, aged 62.

On the 31st ult., at Newhall-street, Birmingham, S. W. Bunbury, M.D.

On the 1st inst., at Warrington, John Sharp, M.R.C.S.E., aged 70.

On the 1st inst., at Gloucester-crescent, Regent's-park, Dr. J. Gibbs, aged 85.

On the 2nd inst., at Blarney, Dr. Lee, Medical Officer of that Dispensary District.

On the 4th inst., at Cosham, Hants, the wife of Frederick B. Jessett, Surgeon, aged 24.

ERRATA.—In the last two numbers of Dr. M. Madden's paper on Rinderpest the word "Prevention" was misprinted "Prevention," and one or two other clerical errors, owing to the writer's absence from town when the paper went to press.

WEEKLY METEOROLOGICAL REPORT FOR THE WEEK ENDING SEPTEMBER 8TH, 1866.

By J. H. STEWARD, Strand and Cornhill, London.

Sept. 1866.	Barometer reading reduced to 32 degrees.	Thermometer.		Dry bulb.	Wet bulb.	Wind.			Remarks.

The Medical Press and Circular.

“STUDENTS’ NUMBER.”

WEDNESDAY, SEPTEMBER 19, 1866.

In this, our “Students’ Number,” we have endeavoured to sustain our position as a British Journal, by producing with equal exactness the Educational Regulations of England, Ireland, and Scotland. To effect this object, and reduce the very voluminous Rules and Bye-Laws to a shape comprehensible to Non-Professional Readers, we have been obliged to curtail them as far as is consistent with its completeness. In doing so we have been careful to confine ourselves to the erasure only of legal technicalities and roundabout phrases, retaining the gist of all the Regulations, educational and otherwise. We believe that no point of interest or importance to the Student will be found wanting.

We have endeavoured, in our Editorial Observations, to supplement the official Regulation of Universities, Colleges, and Schools, by information respecting the means usually employed for obtaining Professional Qualifications and Admission to the Medical Departments of the Public Services, which can only be obtained through private sources, and is of quite as much importance to Students as the official Regulations.

HOW TO OBTAIN APPOINTMENTS IN THE PUBLIC SERVICE,

ARMY MEDICAL SERVICE.

The appointment of Assistant-Surgeon in the Army is open to all who can prove their claim to it by superior answering. Competitive Examinations are held at Chelsea, usually in the first week of February and August. The candidate is not required to produce any other qualification before presenting himself for examination, than his Licences to practise and certificate of Registration, and in this respect the Army service differs from the Naval, in which the very senseless practice of compelling a candidate to produce all his certificates is forced. The candidate having sent in his papers and forwarded them to London, meets his competitors at Chelsea. He is examined by Dr. Hooker on Natural History, Botany, Chemistry, and Materia Medica; by Dr. Parkes on Medicine, Midwifery, Therapeutics, Pathology, Pharmacy, and the writing of Prescriptions; by Mr. P. Hewett on Surgery and Surgical Appliances; and by Dr. Busk on Anatomy, Physiology, and Comparative Anatomy. Natural History and Botany are voluntary subjects. For the first two days of his examination he is employed on penning answers to printed questions; for the third and fourth days he is examined *viva voce* on all subjects; and on the fifth and sixth days he is tested by the diagnosis of disease at the bedside in the Hospital, by the application of surgical apparatus, and by operations on the dead subject. This trial finished, the successful candidates (varying in number from fifteen to thirty) are selected; but the successful competitors are *not* arranged in order of merit, nor are their marks made known.

A certain number of candidates, whose answering has been satisfactory, but not sufficiently so to entitle them to a place, are offered appointments on the Gold Coast of Africa. These situations, while they are subject to strong objection on the score of the deleterious nature of the climate possess great advantages for those whose health can resist its influence. The districts comprised under the Gold Coast districts are Sierra Leone, Gambia, and Cape Coast Castle. If the candidate accepts the appointment he is sent out at once, without the period of probation to which others are subjected at Netley Hospital. He is allowed to spend a year at home, on full pay, for every year spent in Africa, and the entire period at home and abroad counts as service for pension. The promotion is only too rapid, owing to the dangerous nature of the climate; and we have known the rank of full Surgeon reached in five years from the date of appointment as Assistant-Surgeon.

The competitor who has been so fortunate as to obtain a place in the ordinary service, is not allowed to join his regiment at once. He is obliged to undergo a probation of four months at Netley Hospital, near Southampton, where he is compelled to attend the following lectures—viz., Hygiene, by Dr. Parkes; Pathology, by Dr. Aitken; Military Surgery, by Dr. Longmore; and Tropical Diseases, by Dr. Maclean. The lectures on Military Surgery include gunshot and other wounds; arrangements for the transport of wounded; duties of Army Surgeons in the field, during sieges, on transports, &c.; and other special subjects. Those on Military Medicine refer to the tropical and other diseases of the British possessions and colonies, and to the losses by disease. The lectures on Hygiene relate to the ex-

mination of water, air, food, clothing, &c., of the soldier; his duties and exercise, and the circumstances affecting his health, meteorology, statistics, and prevention of disease. The lectures on Pathology have reference chiefly to the scientific examination of tropical diseases, and of the other complaints which the Army Surgeon is especially called on to investigate. The candidates also attend the wards of the Hospital under the Professors of Medicine and Surgery, to make themselves acquainted with the system of recruiting, and the modes of keeping the Army Medical Returns. They are also called on to make post-mortem examinations, to operate on the dead body, and pass through laboratory practice on the modes of recognising the qualities and adulterations of food, and on microscopic examination of morbid tissues and adulterations of food, &c. During his preliminary training here the student is understood to be in Her Majesty's service; he wears uniform, is under military discipline, and receives pay at the rate of 5s. per day, and 2s. per day for lodging money, if he be not provided with lodgings in the Hospital. At the termination of the four months he is again examined in the subjects in which he has been instructed during that period, his marks are added to those obtained by him at the Competitive Examination, and his position on the list of merit determined by the total. He is then gazetted to his regiment, or employed on the Staff, and enjoys all the rank and honour, pay and privileges of an Assistant-Surgeon, as provided by the Regulations.

NAVAL MEDICAL SERVICE.

The pay in both Army and Navy services is the same. The curriculum is in almost all respects the same as that of the Army, except that naval competitors are obliged to produce their certificates as well as their diplomas in Surgery, a Medical qualification not being absolutely essential. The examinations are held at Whitehall, but they take place at no stated period, and are frequent or at long intervals, according to the number of candidates presenting themselves. As soon as the list contains eight or ten names the candidates are summoned to London, and are at once examined on Anatomy, Surgery, Medicine, and Chemistry, by the Director-General, and by the Deputy-Inspector of Hospitals. The most noteworthy fact in connection with the examination is, the importance attached to a sufficient knowledge of Latin; the candidate is obliged to translate passages from Gregory's *Conspectus*, and unless this part of the examinations be satisfactorily passed the candidate is not permitted to proceed further on the trial of his competency. The successful competitor is not subjected to any probation at Netley Hospital, but is at once appointed as Acting Assistant-Surgeon to his ship, and enjoys from the publication of his "gazette" all the pay, privilege, and advantages of his rank.

IRISH POOR-LAW MEDICAL SERVICE.

The appointments which come directly under the head of the Poor-law are those to Dispensaries and Union Hospitals. By the latest statistics there were 716 Dispensary Districts in Ireland; but as there are sometimes several Dispensaries to a single district, the number of Dispensaries was about 1,000. Each of those Dispensaries, however, has not a separate Medical Officer, there being at present 773 Dispensary Doctors in Ireland. Each district is under the direct control of a committee composed of the neighbouring landholders; the appointments of Medical and other officers are made by this

committee, and the entire management of the district is under their control. Their acts are, however, subject to the approval of the Poor-law Commissioners, who have the power either of interposing their *veto* on any appointment, or even expelling an officer, by a "sealed order," without trial, accusation, and without the resource of appeal or investigation. The salaries of Medical Officers of these districts vary from 100*l.* to 20*l.* a year, the great majority being from 50*l.* to 75*l.* This salary is paid by the Board of Guardians, and an increase or decrease can be made in the amount without the assent and that of the Commissioners. Under the late Sanitary Act the Committee may recompense the Medical Officer for special services, such as those during an epidemic of cholera, or for Sanitary reports. The qualifications for the Medical charge of a Dispensary or Workhouse have, by late order, been fixed at—a licence in Surgery, a Diploma in Medicine, and a Diploma in Midwifery, and the candidate must be at least twenty-three years of age. The success of an applicant, depends, however, to a great extent on his local interest and influence with individual members of the committee, who are wont to discover particular aptitude for the position in the person or character of their own relatives, which they seldom observe in a stranger. There is no pension, superannuation, or allowance for Poor-law Medical Officers, and as their salary is almost always quite insufficient for their maintenance, they must choose a proper field for private practice, or they can never hope to attain an independent position.

The number of Unions in Ireland is 163, to each of which is attached a Medical Officer, who is appointed and controlled by the Board of Guardians in the same manner as the Dispensary Surgeon is by his committee. The salary is usually better than that of the Dispensary Doctor, and the duties are more easy and satisfactory description.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION

REGISTRATION OF MEDICAL STUDENTS.

The following Regulations have been adopted by the General Medical Council, in reference to the Registration of Students of Medicine:—

1. Every Medical Student shall be registered in the manner prescribed by the General Medical Council.
2. No Medical Student shall be registered until he has passed a Preliminary Examination, as required by the General Medical Council.
3. The commencement of the course of Professional Study recognised by any of the Qualifying Bodies, shall not be reckoned as dating earlier than fifteen days before the date of Registration.
4. The Registration of Medical Students shall be placed under the charge of the Branch Registrars.
5. Each of the Branch Registrars shall keep a Register of Medical Students according to the subjoined form.

Form for the Registration of Medical Students.

Date of Registration.	Name.	Preliminary Examination and Date.	Place of Medical Study.

Every person desirous of being registered as a Medical Student, shall apply to the Branch Registrar of the division of the United Kingdom in which he is residing, according to the annexed form, which may be had on application to the several Qualifying Bodies, Medical Schools, and Hospitals; and shall produce or forward to the Branch Registrar a Certificate of having passed a Preliminary Examination, as required by the General Medical Council, and a statement of his place of Medical Study.

7. The Branch Registrar shall enter the applicant's name and other particulars in the Students' Register, and shall give him a Certificate of such Registration.

8. Each of the Branch Registrars shall supply to the several Qualifying Bodies, Medical Schools, and Hospitals, in that part of the United Kingdom of which he is Registrar, a sufficient number of blank Forms of Application for the Registration of Medical Students.

9. The several Branch Councils shall have power to admit special exceptions to the foregoing Regulations as to Registration, for reasons which shall appear to them satisfactory.

10. A copy of the Register of Medical Students, prepared by each of the Branch Registrars, shall be transmitted, on or before the 31st of December in each year, to the Registrar of the General Council, who shall, as soon as possible thereafter, prepare and print, under the direction of the Executive Committee, an Alphabetical List of all Students registered in the preceding year, and supply copies of such authorised List to each of the Bodies enumerated in Schedule (A) to the Medical Acts, and through the Branch Registrars to the several Medical Schools and Hospitals.

11. The several Qualifying Bodies are recommended not to admit, after October, 1870, to the final Examination for a qualification under the Medical Acts, any Candidate (not exempted from Registration) whose name has not been entered in the Medical Students' Register at least four years previously.

In the case of Candidates from other than Schools of the United Kingdom, the Branch Councils shall have power to admit exceptions to this Recommendation.

PRELIMINARY EXAMINATIONS IN ARTS RECOGNISED BY THE GENERAL MEDICAL COUNCIL.

Resolved,—“That Testimonials of Proficiency, granted by the National Educational Bodies according to the subjoined list, may be accepted, the Council reserving the right to add or take from, the List.”

1. A Degree in Arts of any University of the United Kingdom or of the Colonies, or of such other Universities as may be specially recognised from time to time by the Medical Council.
2. Oxford Responsions or Moderations.
3. Cambridge Previous Examinations.
4. Matriculation Examination of the University of London.
5. Oxford Middle Class Examinations (Senior).
6. Cambridge Middle Class Examinations (Senior).
7. Durham Middle Class Examinations (Senior).
8. Durham Examinations for Students in Arts in their Second and First Years.
9. Durham Registration Examination for Medical Students.
10. Dublin University Entrance Examination.
11. Queen University, Ireland, two years' Arts Course for the Diploma of Licentiate in Arts.
12. Preliminary Examinations at the end of A.B. Course.
13. Middle Class Examinations.
14. Matriculation Examinations.
15. First Class Certificate of the College of Preceptors.
16. “Testamur” granted by Codrington College, Barbadoes.
17. Degrees of Associate of Arts granted by the Tasmanian Council of Education, with a Certificate that the Student has been examined in Latin and Mathematics.
18. Resolved,—“That Students who cannot produce any of the Testimonials referred to in the first recommendation [as above] be required to pass an Examination in Arts, established by any of the Bodies named in Schedule (A) to the Medical Act, and approved by the General Medical Council.”

FRANCIS HAWKINS, M.D.,

Registrar of the General Council.

Form of Application for Registration as a Medical Student.

I hereby apply to be Registered as a Student in Medicine, in conformity with the Regulations of the General Council of Medical Education and Registration of the United Kingdom for which purpose I submit the following particulars:

Name of Applicant (To be written in words at length.)		Preliminary Examination.	Date of Preliminary Examination.	Place of Medical Study.
Surname.	Christian name.			

Applicant's Signature, _____

Address, _____

Date of Application, _____

To the Registrar of the
Branch Council for _____

N.B.—The above Form of Application, duly and legibly filled up, must be forwarded to the Registrar, post free, and be accompanied by a Certificate of the Applicant's having passed a Preliminary Examination as required by the General Medical Council; and a statement of his place of Medical Study.

Students who shall have commenced their Professional Studies more than fifteen days before the 2nd October, 1865, are not required to be registered by any Branch Registrar.

ARMY MEDICAL DEPARTMENT.

1. Every candidate must be unmarried. He must produce a birth certificate or a certificate of baptism, or if neither can be obtained, an affidavit from one of the parents or from some other near relative will be accepted. The certificate must show that the candidate is not above twenty-six, nor under twenty-one. He must also produce certificates of moral character, one from the parochial minister if possible.

2. The candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection that can interfere with the discharge of the duties in any climate. He must also attest his readiness to engage for general service immediately on being gazetted.

3. The candidate must possess a diploma or licence in surgery, as well as a degree or licence in medicine.

4. Degrees, diplomas, and certificates of age and of character must be lodged at the Army Medical Department, at least one week before the examination.

5. On producing the foregoing qualifications the candidate will be examined in the following subjects:—Anatomy and Physiology; Surgery, Medicine, including Therapeutics, the Diseases of Women and Children, Chemistry and Pharmacy, and a practical knowledge of drugs. The eligibility of each candidate will be determined by the examinations in these subjects only. Candidates who desire it will be examined in Comparative Anatomy, Zoology, and Botany, with special reference to *Materia Medica*; and the number of marks gained in these subjects will be added to the total number of marks obtained in the obligatory part of the examination by successful candidates, and whose position on the list will thus be improved.

6. The names of candidates who pass will be sent to the Director-General, and communicated to the Professors of the Army Medical School. The names will be arranged in three classes according to merit.

7. After passing his preliminary examination, every candidate must attend practical instruction at the Army Medical School, before being admitted to his examination for a commission, on Hygiene, Clinical and Military Medicine, Clinical and Military Surgery, Pathology of Diseases and Injuries incident to Military Service. These courses to be not less than four months.

8. At their conclusion a candidate must pass an examina-

tion on the subjects taught in the school. The Director-General, or any Medical Officer deputed by him may be present, and take part in the examination. If the candidate give satisfactory evidence of being qualified, he will be eligible for a commission as assistant-surgeon.

9. During his residence at the Army Medical School each candidate will receive 5s. per diem with quarters, or 7s. per diem without quarters, to cover all costs of maintenance. And must provide himself with uniform—viz., the regulation undress uniform of an assistant-surgeon, but without the sword.

Note.—All communications to the Director-General, pre-paid, to be forwarded, addressed *outside* to "The Under-Secretary of State for War," with the words "Army Medical Department" at the left-hand corner.

The Assistant-Surgeon is subjected to three separate Examinations within the first ten years of his service, each examination having a definite object. The first, to ascertain, previous to his admission into the Service as a Candidate, his Scientific and Professional education, and to test his acquirements in the various branches of Professional knowledge. The second, after having passed through a course of special instruction in the Army Medical School to test his knowledge of the special duties of an Army Medical Officer; and the third, previous to his promotion, to ascertain that he has kept pace with the progress of Medical Science.

NAVAL MEDICAL DEPARTMENT.

Admiralty Office, Somerset House.

Every Candidate wishing to enter the Royal Navy shall make a written application to that effect, addressed to the Secretary of the Admiralty; on the receipt of which application he will be furnished with the Regulations, and a Printed Form to be filled up by him.

As vacancies occur, the number of Candidates required will be ordered to attend at the Admiralty Office, bringing with them the requisite Certificates, showing that they are fully qualified by Age, Professional Ability, &c., when they will be examined by a Board of Medical Officers, to be named by their Lordships.

Such Candidates as shall have been found in all respects competent for the Appointment of Assistant-Surgeon, will be forthwith nominated to one of the Naval Hospitals at Home, to await Appointments to any of Her Majesty's ships; or should their services not be immediately required, their names will be duly registered for early Appointments, as Vacancies may occur.

"That no Person be admitted as an Assistant-Surgeon in the Royal Navy who shall not produce a Certificate of being registered under the Medical Act, and a Diploma from one of the Royal Colleges of Surgeons of England, Edinburgh, or Dublin; from the Faculty of Physicians and Surgeons of Glasgow, from Trinity College, Dublin, or from other Corporate Body legally entitled to grant a Diploma in Surgery; nor as a Surgeon, unless he shall produce a certificate from one of the said Colleges, Faculty, or Corporate Body, founded on an examination to be passed subsequent to his Appointment of Assistant-Surgeon, as to his fitness for his situation of Surgeon in the Navy; and in every case of the Person producing such Diploma and Certificate shall also undergo a further examination, touching his qualifications in all the necessary branches and points of Medicine and Surgery, both at the time of his entry, and after serving three years, to render himself eligible for Surgeon;" and that previously to the admission of Assistant-Surgeons into the Navy, it will be required that they produce proof of having received a preliminary classical education, and that they possess in particular a competent knowledge of Latin; also,

That they are of good moral character; the Certificate of which must be signed by the Clergyman of the Parish, or by a Magistrate of the District.

That they have served an Apprenticeship, or have been engaged for not less than six months in Practical Pharmacy.

That their Age be not less than 20, nor more than 26 years.

That they have actually attended a recognised Hospital for eighteen months subsequently to the Age of 18, in which Hospital the average number of Patients is not less than 100.

That they have been engaged in actual dissections of the human body twelve months; the Certificate of which, from the Teacher, must state the number of subjects or parts dissected by the Candidate.

That they have attended Lectures, &c., on the following subjects, at established Schools of Eminence, by Physicians or

Surgeons of the recognised Colleges of Physicians and Surgeons, in the United Kingdom, for periods not less than he under stated, observing, however, that such Lectures will be admitted if the Teacher shall Lecture on more than one branch of Science, or if the Lectures on Anatomy, Surgery and Medicine, be not attended during Winter Sessions of Months each.

Anatomy, eighteen months; or General Anatomy, twelve months, and Comparative Anatomy, six months.
Surgery: General Surgery, twelve months; or Military Surgery, six months, and General Surgery, six months.

Theory of Medicine, and Practice of ditto, six months each. If the Lectures on the Theory and Practice of Medicine given in conjunction, the period required is twelve months.
Clinical Lectures (at an hospital as above) on the Practice of Medicine and on the Practice of Surgery, six months each.

Chemistry, six months; or Lectures on Chemistry, three months, and Practical Chemistry, three months.

Materia Medica and Midwifery, six months each.
Botany, three months.

Although the above are the only qualifications which absolutely required in Candidates for the Appointment of Assistant-Surgeon, a favourable consideration will be given to the cases of those who have obtained the Degree of M.D. at either of the Universities of Oxford, Cambridge, Edinburgh, Dublin, Glasgow, London, or Aberdeen; or who, by possessing a knowledge of the diseases of the Eye, and of any branch of science connected with the Profession, such as Medical Jurisprudence, Natural History, Natural Philosophy, &c. appear to be more peculiarly eligible for admission into the Service, observing, however, that Lectures on these or other subjects cannot be admitted as compensating for a deficiency in those required by the Regulations.

By the Rules of the Service, no Assistant-Surgeon can be promoted to the rank of Surgeon until he shall have served five years (two years of which must be in a Ship actually employed at sea), and can produce a Certificate from one of the before-mentioned Colleges, Faculty, or Corporate Body. Whenever Assistant-Surgeons already in the Service (whose professional education may not be in accordance with the above), obtain leave to study previously to their passing as Surgeon, they will be required on their examination, to produce testimonials of their having availed themselves of a period of leave to complete their Education agreeably to the Regulations generally.

REGULATIONS AND BYE-LAWS OF LICENSING BODIES IN ENGLAND.

UNIVERSITY OF OXFORD.

FACULTY OF MEDICINE.

(Founded 872.)

CHANCELLOR, the Earl of Derby
VICE-CHANCELLOR, J. P. Lightfoot, D.D., Rector of Exeter College
REGISTRAR, E. W. Rowden, D.C.L.

The affairs of the University are managed, and its regulations are made, either by a Convocation consisting of Doctors in Divinity, Law, and Medicine, and Masters of Arts or by the Resident Doctors and Masters, or by the Council.

There are 24 Colleges and Halls in Oxford. Every Student must reside in one or other of these for a period of three years.

During these three years, he has to pass at least two Examinations in Arts, and one in either Mathematics, Natural Science, or Law and Modern History, or a third in Arts.

A Student deciding to graduate in Medicine should produce as follows:

- 1st. To enter at a College or Hall.
 - 2nd. To pass the requisite Examination in Arts.
 - 3rd. After passing the requisite Examination for the Degree of B.A., to spend two years in study* prior to a Scientific Examination for the Degree of Bachelor of Medicine; two years more prior to the final or practical Examination for the same Degree. These four years of medical study may be spent either out of or in Oxford, in an approved Medical School.
- This Degree confers the Licence to Practise. There

* If he have taken the higher honours in the Natural Science School, he may go in for the 1st M.B. Examination on the opportunity.

subsequent Examination for the Degree of Doctor in Medicine. For that Degree a dissertation has to be publicly read three years after the B.M.

The instruction in Natural Science is carried on at the MUSEUM, where the following Teachers have their Departments:—

- Regius Professor of Medicine, and Clinical Professor, H. W. Acland, M.D., LL.D., F.R.S.
- Savilian Professor of Astronomy, W. F. Donkin, M.A., F.R.S.
- Savilian Professor of Geometry, J. S. Smith, M.A., F.R.S.
- Professor of Experimental Philosophy, R. B. Clifton, M.A.
- Professor of Natural Philosophy, B. Price, M.A., F.R.S.
- Professor of Geology, J. Phillips, M.A., LL.D., F.R.S.
- Professor of Mineralogy, M. H. N. Story Maskelyne, M.A.
- Professor of Chemistry, Sir B. C. Brodie, Bart., M.A., F.R.S.
- Linacre Professor of Physiology, G. Rolleston, M.D., F.R.S.
- Professor of Zoology, J. O. Westwood, M.A., F.L.S.
- Lee's Reader in Anatomy, W. S. Church, B.A.
- Lee's Reader in Chemistry, A. G. V. Harcourt, M.A.
- Demonstrator in Anatomy, Charles Robertson, Esq.
- Radcliffe Librarian, H. W. Acland, M.D., F.R.S.
- Sub-Librarian, Mr. Haines.
- Sherardian Professor of Botany at the Botanical Garden. C. G. B. Daubeny, M.D., F.R.S.

The Medical Examinations take place annually in the Michaelmas Term.

Scholarships of about the value of £75 are obtainable at Christ-Church, Magdalen, and other Colleges, by competitive Examination in Natural Science. Every year a Radcliffe Travelling Fellowship is competed for by any who, having taken a first class in the Natural Science School, propose to study Medicine. The Travelling Fellows receive £200 a year for three years, half this period being spent in study abroad.

Regulation for Degrees in Medicine.

No one may be admitted a Student in Medicine until he has passed all the Examinations required for the degree of B.A.

1. Candidates for the degree of B.M. are required to pass two Examinations, each of which is held yearly in full Michaelmas Term, usually in November, the first by the Regius Professor of Medicine and three persons who have been admitted to Regency either as Masters of Arts or as Doctors, and who are nominated yearly by the Vice-Chancellor subject to the approval of Convocation, the second by the Regius Professor and two Doctors of Medicine nominated in like manner. Each Examination is conducted partly in writing, partly *viva voce*, and part of each is practical. The subjects of the first Examination are Human Anatomy and Physiology, Comparative Anatomy and Physiology to a certain extent, and those parts of Mechanical Philosophy, Botany, and Chemistry which illustrate Medicine. The subjects of the second Examination are the Theory and Practice of Medicine (including diseases of women and children), the *Materia Medica*, Therapeutics, Pathology, the principles of Surgery and Midwifery, Medical Jurisprudence, and General Hygiene. Every Candidate at this second Examination is to be examined in two of the ancient authors, Hippocrates, Aretæus, Galen, and Celsus, or in one of those four and in some modern author approved by the Regius Professor.*

Before a candidate is admitted to the first of these two examinations, he must have completed eight Terms from the date of his *Testamur* in the Classical School at the Second Public Examination for the degree of B.A., unless he was placed in the First or Second Class in the School of Natural Science, in which case, if he received from the Public Examiners a special Certificate of his attainments in Mechanical Philosophy, Chemistry, or Botany, he may be admitted to this Examination at once, and need not then be examined again in any Science specified in such Certificate. Before a Candidate is admitted to the second Examination, he must have completed sixteen Terms from the date of the same *Testamur* and two years from the date of his *Testamur* in the first Medical Examination, and must deliver to the Regius Professor satisfactory Certificates of his attendance at some hospital of good repute. Every one intending to be a Candidate at either Examination is required to give the Professor notice of his intention a fortnight at least before the week in which the Examination is to be held.

No one from another University can be incorporated as a

*Such modern authors are Morgagni, Sydenham, Boerhaave.

Graduate in Medicine without passing these two Examinations.

2. A Bachelor of Medicine wishing to proceed to the degree of Doctor is required to read publicly within the precinct of the Schools in the presence of the Regius Professor a Dissertation composed by himself on some Medical subject approved by the Professor, and to deliver to him a copy of it.

UNIVERSITY OF CAMBRIDGE.

- CHANCELLOR, The Duke of Devonshire, LL.D., Trinity Coll.
- HIGH STEWARD, Earl Powis, LL.D., St. John's Coll.
- VICE-CHANCELLOR, H. W. Cookson, D.D., St. Peter's Coll.
- REGISTRAR, H. R. Luard, M.A., Trinity Coll.

<i>Professorships.</i>	<i>Professors.</i>	<i>College.</i>	<i>Elected.</i>
Regius Physic	H. J. H. Bond, M.D.	Corpus Christi	1851
Chemistry	G. D. Liveing, M.A.	John's	1862
Anatomy	W. Clark, M.D., F.R.S.	Trinity	1817
Botany	C. C. Babington, M.A.	John's	1861
	F.R.S., F.L.S.		

Downing Me- dicine	W. W. Fisher, M.D.	Down	1841
-----------------------	--------------------	------	------

<i>Lecturers.</i>			
Linacre on Medicine	C. E. Paget, M.D.		
Human Anatomy	G. M. Humphry, M.D., F.R.S.		
Surgery			
Chemistry			
Practical Chemistry	G. D. Liveing, M.A.		
Superintendence of Dissections			
	G. F. Helm, B.A., F.R.C.S.		

The course of lectures on Physic consists of fifty (twenty on general and thirty on special Pathology), delivered during the Lent and Easter terms.

The course on Human Anatomy consists of seventy, delivered during the Michaelmas and Lent terms by Dr. Humphry.

The course on Chemistry consists of fifty, delivered during the Lent and Easter terms.

The course on Botany consists of twenty, delivered during the Easter term.

The Downing Professor delivers a course of fifty lectures on some subject connected with the study of Medicine in the Michaelmas and Lent terms.

The Professor of Anatomy delivers a course of twenty-five lectures on Comparative Anatomy during the Michaelmas term.

Dr. Humphry delivers a course of lectures on Surgical Pathology during the Summer.

Pupils have an opportunity of dissecting in private.

There is a rich and interesting Anatomical Museum open to medical students daily.

Students are admitted to the medical and surgical practice of the Hospital on the payment of 10*l.* 10*s.* for a year, and an additional 5*l.* 5*s.* for an unlimited period.

Medical students are required to enter at one of the seven-teen Colleges (it matters not which), and reside there nine terms (nearly three years), during the first half of which time they are generally occupied in the study of Classics, Mathematics, &c., in their respective Colleges; then, having passed the previous Examination in these subjects, analogous to the preliminary examination required at the University of London, they can pursue the study of Medicine, attend the practice of the Hospital, and the Professor's lectures above specified. This done, they may continue their medical studies in Cambridge, or elsewhere.

Or he may proceed to take a degree in Arts, either continuing mathematical and classical study, and passing the ordinary examination for B.A., or going out in the Mathematical or Classical Tripos; or he may pursue the study of Natural Science, and take the B.A. degree, by going out in the Natural Sciences Tripos. This last plan is preferred by many medical students, the subjects for this Tripos examination (Chemistry, Botany, Comparative Anatomy, &c.) forming part of the series of medical study, and students are not required to be again examined in any of those subjects in which they have shown proficiency in the Tripos examination. Those who proceed to B.A. through a Tripos examination are said to take the degree with honours.

PROCEEDINGS IN PHYSIC. M.B.

The candidate for M.B. must have resided nine terms (nearly three years), have passed the previous Examination in Classics, Mathematics, &c., and have been engaged five years in medical study, of which six terms must have been in the University. Only four years of medical study, of which *four* terms are in the University, are required of those who graduate with honours as B.A.

There are two examinations for M.B. The first after three ears of medical study. The subjects are Chemistry, Botany,

Elements of Comparative Anatomy, Human Anatomy and Physiology, Materia Medica and Pharmacy, Pathology, Portions of Celsus, Hippocrates, and Aretæus.

The student, before admission to this first Examination, must produce certificates of attendance on lectures on Chemistry, including manipulations, Botany, Elements of Comparative Anatomy, Human Anatomy and Physiology, Pathology, Materia Medica and Pharmacy, of dissection during one season and of attendance on Hospital Practice.

The second Examination is after the completion of the course of medical study. The subjects are Pathology and Practice of Physic, Clinical Medicine, Medical Jurisprudence, the medical treatment of Surgical and Obstetrical Diseases. The student, before admission to this second examination, must produce certificates of attendance on lectures on Principles and Practice of Physic, Clinical Medicine, Clinical Surgery, Medical Jurisprudence, and Obstetrical Medical, and of attendance on Hospital Practice for three years.

After the Examinations have been passed, an Act must be kept. The candidate reads a thesis composed in English by himself on some subject approved by the Professor. He is then questioned in English by the Professor on the subject of the thesis, and on other subjects in the faculty of a more general nature.

M.D.

The candidate can be admitted to the degree of M.D. in the ninth term (nearly three years), after taking the degree of M.B. A Master of Arts may be admitted to the degree of M.D. at the prescribed period, when he has produced the same certificates and passed the same Examinations as are required for the degree of M.B.

An Act has to be kept similar to that required for M.B.

M.C.

The candidate for the degree of MASTER IN SURGERY is required to pursue the same course as for M.B. during the first three years, *i.e.*, during his residence in the University, and to pass the same First Examination.

He must attend the Surgical practice of a Hospital for three years, and be House-Surgeon or Dresser during six months; must attend Lectures on Human Anatomy (two courses with dissections during two seasons), on Surgery, Clinical Surgery, Midwifery (with ten cases), and Medical Jurisprudence.

The second Examination, after the completion of the period of study, is in Practical and Surgical Anatomy, Principles and Practice of Surgery, and Clinical Surgery, Midwifery and Medical Jurisprudence.

The expenses of residence, lectures, &c., at College—*i.e.*, in the University, need not at all exceed 150*l.* per annum. That is quite sufficient; and an intelligent student, who has been well taught at school, may be pretty sure of defraying part of the expense by obtaining one of the many Scholarships at his College. These range in value from 20*l.* to 80*l.* a-year. They are chiefly given for mathematical and classical proficiency. Some may be obtained at once, even before entering, and notices of the times of examination for these, which vary at the different Colleges, are given from time to time, under the head of "University Intelligence," in the *Times* and other newspapers, and information respecting them is forwarded to most schoolmasters. Students sometimes try for these Scholarships at several Colleges in succession. At Downing and Sidney Colleges the examination is not confined to Classics and Mathematics, but Natural Science is taken into account. The greater number of the Scholarships are given by competition after a year's residence. One at Caius is given for Anatomy, another for Chemistry.

UNIVERSITY OF LONDON.

EXAMINATION FOR THE DEGREE OF BACHELOR OF MEDICINE.

Candidates are required—1. To have passed the matriculation examination of this University, or to have taken a degree in Arts in some other University. 2. To have been engaged in their professional studies four years subsequently to matriculation; one year, at least, of the four in the United Kingdom. 3. To pass the Preliminary Scientific Examination and two examinations in Medicine.

The *Preliminary Scientific Examination* takes place on the third Monday in July. The candidate must have completed his seventeenth year, and have either passed the Matriculation Examination or taken a degree in Arts.

Fourteen days' notice must be given to the registrar previous to the examination.

The following is the programme of this examination:—Monday: morning, ten to one; afternoon, three to six, Chemistry,

by printed papers. Wednesday: morning, ten to one, Mechanical Philosophy, by printed papers. Thursday: morning, ten to one, Botany and Vegetable Physiology, by printed papers and specimens; afternoon, three to six, Zoology, by printed papers and specimens. Friday and Saturday: commencing at ten A.M., Chemistry, by *visu voce* and experiment.

Any candidate who has passed the Preliminary Scientific Examination may, on the Tuesday and Wednesday in the second week after the pass examination, be examined for Honours in Chemistry and Natural Philosophy, and on the following Thursday and Friday in Biology.

FIRST M.B. EXAMINATION.

Takes place on the last Monday in July.

A candidate must produce certificates to the following effect:—1. Of having completed his nineteenth year. 2. Of having passed the Preliminary Scientific Examination at least one year previously. 3. Of having, subsequently to Matriculation, been a student during two years at a medical school recognised by this University; and of having attended a course of lectures on three of the subjects in the following list:—Descriptive and Surgical Anatomy, General Anatomy and Physiology, Comparative Anatomy, Pathological Anatomy, Materia Medica and Pharmacy, General Pathology, General Therapeutics, Forensic Medicine, Hygiene, Midwifery and Diseases peculiar to Women and Infants, Surgery, Medicine. 4. Of having, subsequently to Matriculation, dissected during two winter sessions. 5. Of having attended a course of Practical Chemistry, comprehending the more important processes of General and Pharmaceutical Chemistry; in applying tests for discovering the adulteration of articles of the Materia Medica, and the presence and nature of poisons; and in the examination of mineral waters, animal secretions, urinary deposits, calculi, &c. 6. Of having attended to Practical Pharmacy.

These certificates must be transmitted fourteen days before the examination.

Candidates are examined in Anatomy, Physiology, Materia Medica, and Pharmaceutical Chemistry, and Organic Chemistry partly by printed papers and partly *visu voce*, and by experiments and demonstrations.

The examinations for Honours take place in the week following the First M.B. examination, and are conducted by means of printed papers.

SECOND M.B. EXAMINATION.

This examination takes place on the first Monday in November.

No candidate is admitted within two academical years of the time of passing the first examination, nor without producing certificates—1. Of having passed the First M.B. examination. 2. Of having, subsequently, attended a course of lectures on two of the subjects specified, and for which the candidate had not presented certificates at the first examination. 3. Of having conducted twenty labours. 4. Surgical hospital during two years, and lectures on clinical surgery. 5. Medical hospital two years, with lectures on clinical medicine. 6. Of having, subsequently during hospital practice, attended to practical medicine or midwifery, with special charge of patients in an hospital, infirmary, dispensary, or parochial union, during six months. Certificates of moral character from a teacher in the last school at which candidates have studied.

Candidates are examined in General Pathology, General Therapeutics and Hygiene; Surgery; Medicine; Midwifery and Forensic Medicine. The examinations include question in Surgical and Medical Anatomy, Pathological Anatomy, and Pathological Chemistry; and are partly in writing, and partly oral. They also include examination and report on cases of medical patients; demonstrations from specimens and preparations; practical examination in Forensic Medicine; and writing prescriptions in Latin without abbreviations.

HONOURS.

Any candidate placed in the first division at the Second M.B. examination may be examined for Honours in Medicine, Midwifery, and Forensic Medicine.

The examinations commence in the week following the Second M.B. examination, and are conducted by means of printed papers.

The candidates who most distinguish themselves in this examination will receive respectively—in Medicine, 50*l.* per annum for the next two years, with the style of University Scholar in Medicine; in Midwifery, 30*l.* per annum for the next two years, with the style of University Scholar in Midwifery; in Forensic Medicine, 30*l.* per annum for the next two years, with the style of University Scholar in Forensic Medicine.

ine. Also the first and second candidates in each of the preceding subjects will each receive a Gold Medal of the value of 5*l*.

MASTER IN SURGERY.

The examination for this degree takes place yearly, commencing on the first Monday in March.

No candidate will be admitted unless he have produced certificates:—1. Of having taken the degree of Bachelor of Medicine in this University. 2. A course of instruction in Operative Surgery, and of having operated on the dead subject. 3. Of having, subsequently to having passed the First I.B. examination, attended to Practical Surgery, with special charge of patients, in an hospital, infirmary, dispensary, or charitable union, six months. Certificates must be transmitted fourteen days before the examination.

Any candidate who has passed the M.S. may be examined or Honoured in Surgery.

The examination is conducted by means of printed papers.

The candidate who shall distinguish himself in Surgery will receive 50*l*. per annum for the next two years, with the style of University Scholar in Surgery. The first and second candidates will also receive a Gold Medal of the value of 5*l*.

DOCTOR OF MEDICINE.

The examination takes place on the fourth Monday in November.

No candidate shall be admitted without certificates:—1. Of having taken the degree of Bachelor of Medicine in this University. 2. Of having attended, subsequently, (a) to Clinical or Practical Medicine two years; (b) to Clinical or Practical Medicine during one year, and of having been engaged during three years in the practice of his profession; (c) or of having been engaged during five years in the practice of his profession, either before or after taking the degree. One year of Clinical Medicine, or two years of practice, will be dispensed with in the case of those candidates who at the second examination have been placed in the first division. 3. Of moral character, signed by two persons of respectability.

Certificates must be transmitted fourteen days before the examination.

The examination is conducted by means of printed papers and *vivâ voce*.

Candidates are examined in Logic and Moral Philosophy, and Medicine.

The candidate who shall distinguish himself the most will receive a Gold Medal of the value of 20*l*.

The fee for each degree is 5*l*.

UNIVERSITY OF DURHAM.

LICENCES AND DEGREES IN THE FACULTY OF MEDICINE.

1. Every student in Medicine must be registered, and pass the registration examination, or such other examination as the Senate shall deem equivalent. The examination shall be directed to the rudiments of religion, literature, and science.

2. Petitioner must be of the age of twenty-one years, and have spent four years in medical study since his registration, and have passed two public examinations. No one shall be admissible to the first of these examinations unless he has spent two years in medical study, or to the second unless he has spent four years, and has passed the first examination. No one shall be admissible to either of these examinations unless he has produced testimonials of conduct, and such certificates of attendance on lectures and hospital as the Senate shall require.

3. Bachelors in Medicine must be Licentiates in Medicine, and of the standing of eighteen terms (six years) at least from every date of registration. One not a Bachelor of Arts must have kept three terms by residence at Durham, and has passed both the final examination for Bachelor of Arts, or an equivalent to it, and also the examination for Bachelor of Medicine. The examination shall be directed chiefly to the practice of Medicine. The Senate shall arrange for medical students an examination equivalent to that for Bachelor of Arts, by substituting an examination in Hippocrates, Galen, or other ancient medical author.

4. Doctors of Medicine must be Bachelors of Medicine of twenty-one terms at least (seven years) standing from his registration.

5. A Master in Surgery must be of the age of twenty-one years, have spent four years in medical and surgical study since his registration, and have passed two public examinations. The first shall be the first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The second shall be the second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The third shall be the third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fourth shall be the fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifth shall be the fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixth shall be the sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventh shall be the seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighth shall be the eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The ninth shall be the ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The tenth shall be the tenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eleventh shall be the eleventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twelfth shall be the twelfth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirteenth shall be the thirteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fourteenth shall be the fourteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifteenth shall be the fifteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixteenth shall be the sixteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventeenth shall be the seventeenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighteenth shall be the eighteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The nineteenth shall be the nineteenth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twentieth shall be the twentieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-first shall be the twenty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-second shall be the twenty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-third shall be the twenty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-fourth shall be the twenty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-fifth shall be the twenty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-sixth shall be the twenty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-seventh shall be the twenty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-eighth shall be the twenty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The twenty-ninth shall be the twenty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirtieth shall be the thirtieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-first shall be the thirty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-second shall be the thirty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-third shall be the thirty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-fourth shall be the thirty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-fifth shall be the thirty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-sixth shall be the thirty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-seventh shall be the thirty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-eighth shall be the thirty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The thirty-ninth shall be the thirty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fortieth shall be the fortieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-first shall be the forty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-second shall be the forty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-third shall be the forty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-fourth shall be the forty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-fifth shall be the forty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-sixth shall be the forty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-seventh shall be the forty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-eighth shall be the forty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The forty-ninth shall be the forty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fiftieth shall be the fiftieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-first shall be the fifty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-second shall be the fifty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-third shall be the fifty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-fourth shall be the fifty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-fifth shall be the fifty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-sixth shall be the fifty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-seventh shall be the fifty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-eighth shall be the fifty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The fifty-ninth shall be the fifty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixtieth shall be the sixtieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-first shall be the sixty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-second shall be the sixty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-third shall be the sixty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-fourth shall be the sixty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-fifth shall be the sixty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-sixth shall be the sixty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-seventh shall be the sixty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-eighth shall be the sixty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The sixty-ninth shall be the sixty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventieth shall be the seventieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-first shall be the seventy-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-second shall be the seventy-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-third shall be the seventy-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-fourth shall be the seventy-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-fifth shall be the seventy-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-sixth shall be the seventy-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-seventh shall be the seventy-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-eighth shall be the seventy-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The seventy-ninth shall be the seventy-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eightieth shall be the eightieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-first shall be the eighty-first examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-second shall be the eighty-second examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-third shall be the eighty-third examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-fourth shall be the eighty-fourth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-fifth shall be the eighty-fifth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-sixth shall be the eighty-sixth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-seventh shall be the eighty-seventh examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-eighth shall be the eighty-eighth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The eighty-ninth shall be the eighty-ninth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The ninetieth shall be the ninetieth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine. The hundredth shall be the hundredth examination for students in Medicine. No one shall be admissible to it who has not spent two years in medical study, and who has not passed the first examination for students in Medicine.

partly the same as that for students in Medicine, and partly in surgical subjects. No one shall be admissible who has not spent four years in medical and surgical study, and passed the first examination. Every one must have produced satisfactory testimonials of conduct, and such certificates of attendance on lectures and hospital as the Senate shall require. The second examination for Master in Surgery may be passed at the same time with the second examination for a licence in Medicine. Any student in Medicine, who commenced before 1861, shall be admitted to the degree on the same conditions as those for a licence in Medicine, provided that he passes also the special examination appointed for Master in Surgery.

ROYAL COLLEGE OF PHYSICIANS, LONDON.

Pall-mall East, Trafalgar Square.

EXTRACTS FROM BYE-LAWS AND REGULATIONS.

Members.

1. Members of the College are alone eligible to the Fellowship. They have the use of the library and museum, are admitted to all lectures, and enjoy further privileges, as may from time to time be defined by the bye-laws; but they have no share in the government, and cannot attend or vote at general meetings.

2. All persons admitted before 1859, Licentiates, shall be entitled to be admitted Members, provided that they accept such membership, and engage henceforth to obey the bye-laws.

3. Any Extra-Licentiate who shall have produced satisfactory testimonials as to character, and declared that he is not engaged in the practice of pharmacy, and who shall comply with such other regulations as are required by the bye-laws, may be proposed to the College to be admitted a Member.

4. All candidates for membership who have commenced studies after Sept., 1861, shall satisfy the Censors' Board that previously to the commencement of their professional studies they have obtained a degree in Arts from some university, or that they have passed their examinations required for a degree in Arts. All other candidates for membership shall be examined on the subjects of general education by the President and Censors.

5. Any person who does not dispense or supply medicine, and who shall have satisfied the College touching his knowledge of medical and general science and literature, and complied with the regulations, may be proposed to the College to be admitted a Member.

1. Every candidate must furnish proof that he has attained the age of twenty-five.

2. A satisfactory testimonial from a Fellow or Member of the College, of moral character and conduct.

3. Of having passed an examination in the subjects of general education; and in the case of candidates who shall have commenced their professional studies after September, 1861, the examination must have been passed before they commenced professional studies.

4. Of having been engaged in the study of Physic during five years, of which four shall have been passed at medical schools recognised by the College.

5. Of having studied the following subjects:—Anatomy, with dissections; Physiology; Chemistry, with Practical Chemistry; *Materia Medica* and Botany; Morbid Anatomy; Principles and Practice of Medicine; Principles and Practice of Surgery; Midwifery, and the Diseases peculiar to Women and Children; Forensic Medicine. Of his having attended diligently, during three years, the medical practice, and during one year the surgical practice of an hospital containing at least 100 beds; and of his having served the office of clinical clerk during at least six months.

11. Every candidate who has prosecuted his studies abroad, shall bring proof of his having attended, during at least twelve months, the medical practice of an hospital in the United Kingdom containing 100 beds.

13. No candidate shall be admitted to examination who is engaged in trade, or who dispenses medicines, or makes any engagement with a chemist or any other person for the supply of medicines or who practises medicine or surgery in partnership, by deed or otherwise, so long as that partnership continues.

14. Or who refuses to make known, when so required by the President and Censors, the nature and composition of any remedy he uses.

15. Every candidate shall have given proof of his acquirements by written answers to questions, and shall have been examined by the President and Censors, and shall have been

and shall have been approved by the President and Censors at each examination.

16. The candidate for membership shall be examined in Physiology, Pathology, and Therapeutics, in three several examinations, by written questions, as well as *viva voce*, at three meetings of the Censors. At the second examination the candidate's knowledge of practical medicine shall be tested by requiring him to examine persons labouring under disease, and to describe morbid specimens. At the commencement of the first *viva voce* examination, the candidate may declare what honours have been conferred upon him, in regard to literature, science, or medicine; and such declaration may be recorded in the annals of the College.

17. A candidate who has already obtained the degree of Doctor or Bachelor of Medicine at a University wherein the courses of study, and the examinations shall have been adjudged by the Censors satisfactory, shall be exempt from the examinations hereinbefore described, except such as relate to Pathology and Therapeutics. Every candidate must translate into English, a passage from a Latin author, and he will have the opportunity of showing a knowledge of Greek, or of one or more of the modern European languages.

18. If a candidate who has attained the age of forty, but has not fulfilled all the conditions required, shall produce testimonials not merely satisfactory as to his moral character and conduct, and his general and professional acquirements, but further showing that he has improved the art or extended the science of Medicine, or has distinguished himself highly as a medical practitioner; the Censors may, if they see fit, submit them to the Fellows at a general meeting, and it shall be determined by the votes of the Fellows present, whether the candidate shall be admitted to an examination, as full and complete as the Censors may deem sufficient.

19. In the case of candidates for membership who shall have commenced studies after September, 1864, the first examination—comprising Anatomy, Physiology, Chemistry, and Materia Medica—shall not be undergone until after two years of professional study at a recognised school. Testimonials of proficiency in the subjects of the first examination, granted by any corporation or university after a course of study and examination satisfactory to the Censors, will be accepted in lieu of the first examination. The second and third examinations, comprising Pathology and Therapeutics, shall not be undergone till after the completion of professional study, and at least two years after the first examination.

Licentiates.

Every candidate is to produce evidence—

1. Of having attained the age of twenty-one years.
2. Of moral character.
3. Of having passed a preliminary examination in general education.
4. Of having been registered as a student.
5. Of professional study during four years, of which the first two and one other year shall have been passed at a recognised school, and the Medical Practice at a recognised hospital during two years; and the Surgical Practice during twelve months; and six months clinical study of Diseases peculiar to Women. The last of the four years must be passed at a medical school, hospital, infirmary, or dispensary recognised by the College.
6. Of having studied the following subjects:—Anatomy (with Dissections), two winter sessions of six months each; Physiology, two winter sessions of six months each; Chemistry, six months; Practical Chemistry, three months; Materia Medica, three months; Practical Pharmacy, three months; Botany, three months; Morbid Anatomy, six months (or attendance in the post-mortem room; (Principles and Practice of Medicine, two winter sessions of six months each,) Principles and Practice of Medicine should comprise the study of Public Health); Principles and Practice of Surgery, six months; Clinical Medicine, nine months; Clinical Surgery, six months, (by Clinical Medicine and Clinical Surgery are intended lectures on cases under observation, or special instruction at the bedside); Midwifery and the Diseases peculiar to Women, three months, (also not less than twenty labours); Forensic Medicine, three months.
7. Of having passed the Professional Examination.

The Professional Examination.

Every candidate must sign a declaration, stating whether he has been rejected within three months by any examining board.

The examination is divided into two parts. The first or Primary, will be conducted as follows:—First day, written

questions on Anatomy and Physiology; second day, written questions on Chemistry, Materia Medica, Practical Pharmacology and *viva voce* on the subjects stated above. The second part or Pass, will be—First day, written questions on the Principles and Practice of Medicine; second day, to examine persons labouring under disease, either at the College or in a hospital, and written questions on Midwifery and the Diseases peculiar to Women, and on the Principles and Practice of Surgery; third day, to examine persons labouring under disease in the surgical wards of an hospital, and *viva voce* on all the subjects stated above.

The Primary shall not be undergone until after two years at a recognised school, and the Pass not until after four years of professional study, and at least eighteen months after the Primary, except in the case of students who commenced before October, 1861.

Any candidate who shall fail to pass either of these examinations will not be re-admitted to examination for six months.

Every candidate intending to present himself is to give fourteen days' notice in writing, at the same time transmitting for the Primary of having passed an Arts examination; and having been registered as a student; and of two years of professional study. For the Pass, of four years of professional study; of having attended twenty labours; and of having attained the age of twenty-one years. A testimonial of moral character is required.

The fee for the Primary is five guineas, to the Pass, ten guineas; and there is no further fee for the licence. Should any candidate fail to pass either examination, the fee will not be returned, but he may be admitted to a subsequent examination without an additional fee.

Doctors or Bachelors of Medicine of a university shall be exempt from the Primary.

Any candidate who has already obtained the Licentiate of the Colleges of Physicians of Edinburgh, or of Ireland, shall be exempt from the Primary.

Any registered practitioner qualified before 1861, will be examined on the Principles and Practice of Medicine, Surgery, and Midwifery; but will be exempted from such other parts of the examination as it may seem to render unnecessary.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

Lincoln's-inn Fields.

FELLOWSHIP.

1. Except in cases provided for to the contrary, every candidate for the Fellowship, whether a Member of the College or not, must produce certificates that he is twenty-five years of age. That he is a fit and proper person to be admitted to the Fellowship, which certificate must be signed by three Fellows. That he has passed the Preliminary Examination in Classics, Mathematics, and French, appointed by the Council, or has passed in Oxford or Cambridge or London the examination in Arts required in those universities, of candidates for their degrees in Medicine. That he has been engaged for six years in the acquirement of professional knowledge in recognised hospitals or schools, three winters and three summers thereof having been passed in London. That he has studied 1. Anatomy and Physiology by lectures and demonstrations and lectures, during three winter sessions of six months each, at recognised schools. 2. Theory and Practice of Medicine and Clinical Medicine, and also on the Theory and Practice of Surgery, and on Clinical Surgery, during two sessions of six months each. 3. One course of lectures on each of the following—viz., Chemistry, Materia Medica, and Midwifery with attendance on cases, Medical Jurisprudence, and Comparative Anatomy. 4. The surgical practice of a recognised hospital during four winters and four summers, and the medical practice of a recognised hospital during one winter and one summer. 5. That he has served as house-surgeon or dresser in a recognised hospital. He is also required to present clinical reports, with observations thereon, of six surgical cases taken by himself at recognised hospitals, with satisfactory evidence of their authenticity.

2. For a candidate who has taken by examination the degree of Bachelor or Master of Arts in any university, it will be sufficient to produce a certificate that he has been engaged for five years (instead of six) in acquirement of professional knowledge, but in all other respects he must produce the certificates of the foregoing courses of study.

3. A member of the College since 1844, will be admitted to examination for the Fellowship upon a certificate from three

Fellows, that he has been eight years in the practice of Surgery, and that he is a fit person to be admitted a Fellow.

4. A Member of the College since 1844 will, after twelve years from date of diploma, be admitted to examination for the Fellowship upon the production of similar certificates.

The Preliminary Examination in Classics, Mathematics, and French, is held in October, and, if required, in April; candidates are admitted upon having completed the eighteenth year of their age, and on the payment of ten guineas.

The Professional Examination is held in May and November, and occupies two days.

The subjects of the first day are Anatomy and Physiology; second day, Pathology, Therapeutics, and Surgery. The candidate has to perform dissections or operations.

A candidate rejected upon his Professional Examination will not be allowed to present himself a second time until after one year.

SUBJECTS OF THE PRELIMINARY EXAMINATION FOR THE FELLOWSHIP.

Classics—Demosthenes, De Corona, down to the end of chap. cv.; Sophocles, Antigone and Ajax; Tacitus, Histories, books i. and ii.; Virgil, Æneid, books v. and vi. Each candidate is required to bring up one Greek, and one Latin author; one prose writer, and one poet.

Mathematics—Arithmetic; Algebra, as far as the doctrine of Proportion, and Simple Equations with one or two unknown quantities; Euclid, books i., ii., and iii.; Statics, Hydrostatics, Optics, and Acoustics. In the physical subjects it will be sufficient to be prepared with general explanations of the leading phenomena, such as may be found in treatises on Physics, except in the case of Statics and Hydrostatics, in which mathematical demonstrations of the elementary propositions will also be required, such as may be found in any of the following books:—Barrett's Propositions in Mechanics and Hydrostatics; Snowball's Cambridge Course of Elementary Natural Philosophy; Whewell's Mechanical Euclid; Williams's Elements of Mechanics and Hydrostatics. In Optics, careful drawings will be required of the course of rays transmitted through lenses, &c., illustrating the formation of images.

French—Translation in two of the following works, at option:—La Henriade, Voltaire; Etudes de la Nature, Bernardin de St. Pierre; Les Girondins, Lamartine. Grammatical questions, particularly conjugation of the irregular verbs in the selected passages.

This examination will be held in October, and, if required, in April.

Candidates are admissible to examination upon having completed the eighteenth year of their age, and on payment of the fee of ten guineas.

EDUCATION AND EXAMINATION FOR THE DIPLOMA OF MEMBER.

Preliminary General Education.

Candidates who commenced their professional education on or after the 1st of January, 1861, will be required to produce certificates of having passed one of the examinations in Preliminary Education recognised by the Medical Council.

Candidates not able to produce one of the foregoing, will be required to pass an examination in English, Classics, and Mathematics, by the Royal College of Preceptors.

SUBJECTS.

Reading aloud; writing from dictation; English grammar; writing a short English composition—such as a description of a place, an account of some useful or natural product, or the like; arithmetic (first four rules, simple and compound, of vulgar fractions, and of decimals); geography of Europe, and particularly of the British Isles; outlines of English history—that is, the succession of the sovereigns, and the leading events of each reign; Euclid, books i. and ii.; translation from the first book of Cæsar's De Bello Gallico. Papers will also be set on the following seven subjects, and each candidate must offer himself on one at least, but no more than four subjects:—Translation of a passage from St. John's Gospel in Greek, Voltaire's *Historie de Charles XII.*, and the first two books of Schiller's *Geschichte des dreissigjährigen Krieges*; the candidate will also be required to answer questions on the grammar of each subject; mathematics (algebra to simple equations inclusive); mechanics (questions elementary); chemistry (elementary facts); botany and zoology (classification of plants and animals). The quality of the handwriting and the spelling will be taken into account.

Professional Education.

Professional studies are not recognised prior to examination

in General Knowledge. (This regulation applies to candidates who commenced after October, 1862.)

The following will be considered as the commencement of professional education:—Attendance on hospital, or other institution recognised by this College. Instruction as the pupil of a surgeon to an hospital, general dispensary, or union workhouse, or where such practical instruction is afforded as shall be satisfactory to the Council. Attendance on lectures on Anatomy, Physiology, or Chemistry.

The commencement of professional study by pupilage will not be admitted until a certificate shall be furnished for registration at the College by the practitioner whose pupil the candidate shall have become, or by the medical superintendent of the hospital or other institution; and will, consequently, date only from the reception of such certificate, the certificate to be accompanied by proof of having passed the Preliminary Examination.

Candidates will be required to produce the following other certificates:—Of being twenty-one years of age. Of having been engaged during four years in the acquirement of professional knowledge. Practical Pharmacy three months. Lectures on Anatomy during two winters. Dissections, two winters. Lectures on Physiology, two winters. On Surgery, two winters; one course not earlier than the third winter. One course on each of the following—viz., Chemistry, Materia Medica, Medicine, and Midwifery. Of instruction and proficiency in Vaccination. Of having attended, at a recognised hospital, the Practice of Surgery, and clinical lectures on Surgery, during three winter* and two summer† sessions, and the Practice of Medicine, and clinical lectures on Medicine, during one winter and one summer session. Of having, after two years' professional education, taken charge of patients under a surgeon during six months, at an hospital, general dispensary, or parochial or union infirmary recognised for this purpose, or in such other similar manner as shall afford sufficient opportunity for the acquirement of Practical Surgery.

N.B.—Blank forms of the required certificates may be obtained on application to the secretary, and all such certificates will be retained at the College.

Certificates will not be received on more than one branch of science from the same lecturer; but Anatomy and Dissections will be considered as one.

Certificates from a recognized provincial or colonial hospital unconnected with a medical school, will not be received for more than one winter and one summer of the hospital attendance, and clinical lectures will not be necessary, but a certificate of having acted as dresser for six months instead.

Certificates will not be received from London students unless they register at the College their cards of admission to lectures and hospital within fifteen days from the commencement of the session; nor from provincial students unless their names shall be duly returned.

Candidates who have pursued the whole of their studies in Scotland or Ireland will be admitted upon the production of the several certificates required respectively by the College of Surgeons of Edinburgh, the Faculty of Physicians of Glasgow, and the College of Surgeons in Ireland for their diploma, together with a certificate in Vaccination, and evidence of four years' professional study. Candidates who pursued the whole of their studies at recognized foreign or colonial universities, upon the certificates required for their degree by such universities, together with a certificate in Vaccination and evidence of at least four years professional study.

Members or licentiates of a College of Surgeons, and graduates in Surgery of medicine of a university, will be admitted to examination on producing their diploma, licence, or degree, together with proof of being twenty-one years of age, a certificate in Vaccination, and evidence of at least four years professional study.

The Professional Examination.

Is divided into two parts. The First or Primary Examination, on Anatomy and Physiology, is partly written and partly demonstrative on the recently dissected subject, and on prepared parts of the human body. The Second or Pass Examination, on Pathology, Surgery, and Surgical Anatomy, is partly written and partly oral. The Primary Examinations are held

* The winter session comprises a period of six months, and, in England, commences on the 1st of October, and terminates on the 31st of March.

† The summer session comprises a period of three months, and, in England, commences on the 1st of May, and terminates on the 31st of July.

in January, April, May, July, and November; and the Pass Examinations generally in the ensuing week respectively. Candidates will not be admitted to the Primary Examination until after the termination of their second winter at a recognised school; nor to the Pass Examination until after the fourth year. The fee of five guineas paid by each candidate prior to his Primary Examination will not be returned, but will be allowed on his admission as a member. A candidate having entered his name for either Examination, who shall fail to attend the meeting of the Court for which he shall have received a card, will not be allowed to present himself within three months from the date. A candidate referred on the Primary Examination is required, prior to re-examination, to produce a certificate of the performance of dissections during not less than three months subsequently. A candidate referred on the Pass Examination is required, to produce a certificate of six months' surgical practice of a recognised hospital, together with lectures on clinical surgery.

SOCIETY OF APOTHECARIES.

Blackfriars, E.C.

Every candidate for a certificate of qualification to practise as an Apothecary will be required to produce testimonials—1. Of having passed a preliminary examination in Arts. (This examination must be passed before the commencement of professional studies, which is defined by the Medical Council to be "the time of commencing studies at a medical school.") 2. Of having served a pupilage of five years to a practitioner qualified by the Act of 1815. (This period may include the time spent in attending lectures and hospital practice.) 3. Of having attained the age of twenty-one. (A copy of the baptismal register where it can be procured.) 4. Of good moral conduct. 5. Of having pursued the following course of study.

Course of Study.—Every Candidate who shall have commenced after October, 1863, must attend the following lectures and medical practice during three winter and two summer sessions.

First Year.—Winter Session: Chemistry; Anatomy and Physiology; Dissections. Summer Session: Botany; Materia Medica and Therapeutics; Practical Chemistry.*

Second Year.—Winter Session: Anatomy and Physiology, including Dissections and Demonstrations; Principles and Practice of Medicine; Clinical Medical Practice. Summer Session: Midwifery and Diseases of Women and Children, and Vaccination; † Forensic Medicine and Toxicology; Clinical Medical Practice.

Third Year.—Winter Session: Principles and Practice of Medicine; Clinical Medical Lectures; Morbid Anatomy; Clinical Medical Practice.

Registration of Testimonials.—All testimonials must be given on a printed schedule, and the blanks therein must be filled up by the lecturers themselves. Students will be supplied with schedules at the time of their first registration, at the Apothecaries' Hall.

All Students in London must personally register the classes for which they have taken tickets, and those only will be considered as complying with the regulations of the Court whose names and classes in the register correspond with their schedules.

Tickets must be registered in October and May. Notice of such registration will be given from time to time.

Students at the provincial medical schools must register their names, in their own handwriting, with the registrar of each respective school, within the first fifteen days of October and May.

Examination in Arts.

An Examination in Arts will take place at the Hall three times in the year—last Friday and Saturday of January, April, and September. By order of the Medical Council, an Examination in Arts is compulsory on all commencing studies after October, 1861, and must be passed previous to registration. Testimonials will be received, as exempting from the Examination in Arts.

Professional Examinations.

The Examiners meet every Thursday, when candidates are required to attend at a quarter before four. Every candidate

* By Practical Chemistry is intended a specific course of instruction in the laboratory, with an opportunity of personal manipulation.

† A certificate of attendance on not less than twenty cases will be received from a legally qualified practitioner; also instruction in vaccination.

must give notice in writing to the Clerk, on or before the previous Monday, and deposit all the required testimonials, and the fee, at the office, any day, except Sunday, from ten to four o'clock.

The examination of candidates is divided into two parts, and is conducted partly in writing and partly *visû vocc.*

The First Examination, which may be passed after the second winter session, embraces the following:—The British Pharmacopœia, Latin of Physicians' Prescriptions; Anatomy and Physiology; General and Practical Chemistry; Botany and Materia Medica.

Second Examination, after the third winter session (the first years' pupilage being completed):—Practice of Medicine and Pathology; Midwifery, including the Diseases of Women and Children; Forensic Medicine and Toxicology.

Graduates in Medicine of a British University are admitted to a practical examination in the Practice of Medicine and Midwifery only.

The examination for certificates of qualification to act as assistant, in compounding and dispensing medicines, will be as follows:—In translating physicians' prescriptions, in the British Pharmacopœia, in Pharmacy and Materia Medica.

No rejected candidate can be re-examined until the expiration of six months, and no rejected candidate, as an assistant, until the expiration of three months.

Fees.—Qualification to practise, six guineas; assistant's certificate, two guineas.

Students' Prizes.—The Society of Apothecaries annually offer two prizes in Botany, and two prizes in Materia Medica and Pharmaceutical Chemistry. The prizes consist of a gold medal awarded to the best candidate, and of a silver medal and a book to the second.

The examination in Botany will be held on the second Wednesday in August, and will be conducted by printed papers and *visû vocc.*

Competitors must send written notice to the Beadle before the 1st of August, with evidence of his having entered upon the second summer session, and by certificates of having attended the lectures and class examinations with diligence.

The examinations in Materia Medica and Pharmaceutical Chemistry will be held on the Third Wednesday, and Friday in October, by printed papers and *visû vocc.*

Competitors must send written notice before the 7th of October, with evidence of having entered upon the third winter session, and certificates of having attended the lectures and class examinations with diligence.

PROVINCIAL SCHOOLS OF MEDICINE.

BIRMINGHAM.—QUEEN'S COLLEGE. Anatomy: Prof. Lloyd. Botany: Prof. Hinds. Chemistry: Prof. Alfred Anderson. Forensic Medicine: Prof. John Postgate. Materia Medica: Prof. Divers. Medicine: Prof. Nelson. Midwifery: Profs. John Clay and Dr. Suckling. Physiology: Prof. Norris. Practical Anatomy and Demonstrations: Prof. Lloyd. Surgery: Prof. Sands Cox. Medical Tutor and Demonstrator: Mr. J. Hinds. Clinical Medicine: Profs. Fleming, and Foster. Clinical Surgery: Profs. West, Gangee, and Jordan. Clinical Midwifery: Prof. Berry. Practical Midwifery: Dr. Suckling and Dr. Earle. The Hospital contains 160 beds, which are constantly filled. During the past year relief was afforded to 1,973 in-patients.

QUEEN'S HOSPITAL—Bath row. It is a distinctive feature of the Queen's Hospital that its medical and surgical appointments are conferred upon the Students without additional fee. The Committee of Council have opened a ward containing 10 beds for the special treatment of Diseases of Children; wards have also been specially set apart for the treatment of Syphilis.

BIRMINGHAM.—SYDENHAM COLLEGE. WINTER SESSION. Anatomy and Physiology: Drs. R. C. R. Jordan and T. H. Bartleet. Anatomy and Demonstrations: Messrs. Jordan and Jones. Principles and Practice of Medicine: Dr. J. Russell. Principles and Practice of Surgery: Messrs. A. Baker and D. Bolton. Surgical Pathology: Mr. O. Pemberton. Dental Surgery and Physiology: Mr. T. Howkins. Chemistry: Dr. A. Hill. **SUMMER SESSION.** Midwifery and the Diseases of Women and Children: Dr. F. Elkington and Mr. Bassett. Materia Medica and Therapeutics: Dr. Foster. Practical Chemistry: Dr. A. Hill. Botany, Systematic and Structural: Mr. Savage. Forensic Medicine: Dr. Hill and Mr. T. Swain.

BIRMINGHAM GENERAL HOSPITAL, Summer lane. Established 1772, contains 240 beds. For further particulars see advertisement.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.—WINTER SESSION. Anatomy, Physiology, and Anatomical Demonstrations: Dr. Waters, Mr. Harrison, and Dr. Roberts. Chemistry and Pharmacy: Dr. J. B. Edwards. Principles and Practice of Medicine: Dr. Cameron. Principles and Practice of Surgery: Messrs. Long and E. R. Bickersteth. SUMMER SESSION. Materia Medica and Therapeutics: Dr. Nevins. Botany: Dr. Collingwood. Midwifery and Diseases of Women and Children: Drs. Grimsdale and Gee. Medical Jurisprudence: Drs. E. Whittle and Edwards. Practical Chemistry: Dr. J. B. Edwards. Ophthalmic Medicine and Surgery: Dr. R. H. Taylor. Pathological Anatomy: Dr. Rawdon. Dental Surgery and Mechanics: Mr. Snape. For further particulars see advertisement.

MANCHESTER ROYAL SCHOOL OF MEDICINE AND SURGERY, Faulkner street (behind the Royal Infirmary).—WINTER SESSION. Physiology: Messrs. T. Turner and W. Smith. Descriptive Anatomy: Mr. E. Lund. Practical Anatomy: Dr. Godson. Chemistry: Mr. D. Stone. Principles and Practice of Medicine: Drs. Browne and Roberts. Principles, Practice, and Operations of Surgery: Mr. G. Southam. Anatomy, Physiology, and Pathology of the Eye: Mr. R. T. Hunt. SUMMER SESSION. Midwifery and Diseases of Women and Children: Mr. G. Greaves. Materia Medica, Medical Botany, and Therapeutics: Mr. A. Somers. General Pathology and Morbid Anatomy: Dr. Morgan. Forensic Medicine: Mr. G. M. Harrison. Botany: Mr. L. Grindon. Practical Chemistry: Mr. D. Stone. HOSPITAL PRACTICE at the Royal Infirmary, where Clinical Lectures on Medicine and Surgery are regularly delivered by the Physicians and Surgeons of the Institution. For further particulars see advertisement.

UNIVERSITY OF DURHAM COLLEGE OF MEDICINE, Newcastle-upon-Tyne.—WINTER SESSION. Physiology: Dr. W. Murray. Anatomy: Dr. T. C. Nesham, Mr. J. Watson, and Mr. L. Armstrong. Dissections: Dr. T. C. Nesham, Mr. J. Watson, and Mr. L. Armstrong. Principles and Practice of Physic: Drs. E. Charlton, and D. Embleton. Principles and Practice of Surgery: Dr. G. Y. Heath. Principles of Chemistry: Dr. T. Richardson, and A. F. Marreco. SUMMER SESSION. Botany and Vegetable Physiology: Mr. J. Thornhill, and Dr. W. C. Arnison. Medical Jurisprudence: Dr. A. S. Donkin. Materia Medica and Therapeutics: Dr. T. Humble. Midwifery and the Diseases of Women and Children: Drs. W. Dawson and C. Gibson. Operative Surgery: Dr. G. Y. Heath. Military Surgery: Sir John Fife. Practical Chemistry: Dr. T. Richardson and A. F. Marreco. Pathological Anatomy: Drs. C. J. Gibb, and G. H. Philipson. HOSPITAL PRACTICE. The Newcastle Infirmary contains 230 beds. Clinical lectures are regularly delivered.

BRISTOL MEDICAL SCHOOL.—WINTER SESSION. Medicine: Dr. Brittan. Surgery: Mr. Coe and Mr. Leonard. Chemistry: Mr. Herapath. General Anatomy and Physiology: Drs. Martyn and Frigg. Descriptive and Surgical Anatomy: Mr. Clark and Mr. Lansdown. SUMMER SESSION. Botany: Mr. Lipner. Materia Medica: Dr. Burder. Midwifery: Dr. Swayne. Forensic Medicine: Dr. Marshall. Chemical Toxicology: Mr. Herapath. Practical Chemistry: Mr. Herapath.

BRISTOL ROYAL INFIRMARY.—The Infirmary contains 242 beds.

BRISTOL GENERAL HOSPITAL.—The Hospital contains 130 beds.

CAMBRIDGE MEDICAL SCHOOL.—WINTER SESSION. Principles and Practice of Medicine: Dr. Bond. General and Comparative Anatomy and Physiology: Dr. Clark. Human Anatomy and Physiology: Dr. Humphry. Dissections: Dr. Carver. Chemistry: Prof. Liveing. SUMMER SESSION. Botany: Prof. Babington. Materia Medica and Therapeutics: Dr. Fisher. Practical Chemistry: Prof. Liveing. Clinical Lectures are delivered weekly at Addenbrooke's Hospital.

LEEDS SCHOOL OF MEDICINE.—WINTER SESSION. General Anatomy, Physiology, and Pathology: Messrs. Ikin and C. G. Wheelhouse. Anatomy: Messrs. T. P. Teale, jun., E. Atkin, and J. Seaton. Principles and Practice of Surgery: Messrs.

S. Hey and Smith. Chemistry: Messrs. Scattergood and R. Fairly. Principles and Practice of Physic: Drs. Chadwick, Heaton, and Allbutt. Demonstrator: Mr. Seaton. SUMMER SESSION. Materia Medica and Therapeutics: Dr. Allbutt. Midwifery and Diseases of Women and Children: Messrs. Smith and W. N. Price. Forensic Medicine and Toxicology: Dr. P. Smith. Practical Chemistry: Mr. Fairley. Botany: Mr. W. Hall. Clinical Lectures at the General Infirmary, twice a week, on Medical Cases, by Drs. Chadwick, Eaton, and Allbutt; and on Surgical Cases, by Messrs. S. Hey, Nunneley, Wheelhouse, and T. P. Teale, jun. On Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley.

HULL AND EAST RIDING SCHOOL OF MEDICINE AND ANATOMY, Kingston square.—WINTER SESSION. Anatomy, Physiology, and Pathology: Mr. R. M. Craven. Anatomical Demonstrations: Dr. King. Principles and Practice of Medicine: Dr. Daly. Principles and Practice of Surgery: Mr. King. Chemistry: Mr. Walton. SUMMER SESSION. Midwifery and Diseases of Women and Children: Mr. H. Gibson. Materia Medica and Therapeutics: Mr. Holden. Forensic Medicine: Dr. Munroe. Botany: Mr. Niven. Clinical Lectures will be given at the Hospital twice a week on Medicine, by Sir H. Cooper and Dr. Daly; on Surgery, by Dr. Lunn, Mr. Craven, and Dr. King.

SHEFFIELD MEDICAL SCHOOL.—WINTER SESSION. Anatomy, Descriptive and Surgical: Mr. Skinner and Mr. Le Tall. Demonstrations of Anatomy: Mr. Wm. Skinner and Mr. A. Jackson. Physiology: Dr. Mason and Mr. T. H. Morton. Principles and Practice of Medicine: Dr. Elam and Dr. Frank Smith. Principles and Practice of Surgery, Mr. W. F. Favell and Mr. Parker. Chemistry: Mr. Allen. Dental Mechanics: Mr. Moseley. Lectures on Clinical Medicine: Dr. Bartolomé, Dr. Elam, and Dr. Law. Lectures on Clinical Surgery: Mr. Barber, Mr. Favell, and Mr. Parker. The Summer Session will commence May 1, 1867. Midwifery and Diseases of Women: Dr. Aveling and Dr. Keeling. Materia Medica and Therapeutics: Dr. Young. Medical Jurisprudence; will be filled up shortly. Botany: Mr. Birks and Dr. Mason. Practical Chemistry: Mr. Allen. Ophthalmic Surgery: Mr. Gillott. Dental Surgery: Mr. Merryweather. Hospital Practice at the Sheffield General Infirmary. Fees: Medical Practice, perpetual, 15*l.* 15*s.*; Surgical Practice, perpetual, 21*l.* Perpetual Fee for all Lectures required by the College and Hall, 40*l.*

REGULATIONS OF IRISH LICENSING BODIES.

ROYAL COLLEGE OF SURGEONS, IRELAND.

Court of Examiners.—W. Hargrave, A.M., M.B., Christopher Fleming, M. H. Stapleton, B. W. Richardson, Edward A. Stoker, George H. Porter, T. J. Tufnell, J. Barker.

Examiners in Midwifery.—E. J. Quinan, A. H. McClintock, James Isdell.

Examiners in General Education.—T. Byrne, A. B., M.B., John Murray, A.M., LL.D., G. F. Shaw, LL.D., F.T.C.D.

PROFESSORS.

Anatomy and Physiology.—Arthur Jacob.
Practical and Descriptive Anatomy.—P. Bevan and John Morgan.
Theory and Practice of Surgery.—William Hargrave and J. S. Hughes.
Theory and Practice of Physic.—C. Benson.
Chemistry.—William Barker.
Materia Medica.—R. Macnamara.
Midwifery and Diseases of Women and Children.—James H. Sawyer.
Medical Jurisprudence.—T. G. Geoghegan.
Botany.—Arthur Mitchell.
Hygiene.—E. D. Mapother.

REGISTRATION OF PUPILS.

Every person shall be registered as a Pupil on the College books, if he shall have laid before the Council a receipt showing that he has lodged in the Bank of Ireland a fee of five guineas.

Registered Pupils can study in the Museum on two days in each week, and to read in the Library every day, from ten to one o'clock. They may also attend the Lectures on Comparative Anatomy, and obtain the certificate without payment. No student is admitted to the sessional or final examination or Letters Testimonial until he becomes a Registered Pupil.

CLASSICAL EXAMINATION.

Registered Pupils are admitted to the Classical Examination at any period previous to the final Examination for Letters Testimonial.

Students not Registered Pupils are also admitted to the Classical Examination upon payment of ten shillings; but they are not enrolled as Registered Pupils, or entitled to the privileges of such pupils, until they have paid the full registration fee of five guineas.

The following resolution was passed at a meeting of the Council held on Thursday, the 18th of August, 1865—viz. :—

“That from November 1, 1865, Candidates may select, as the subject of examination, any of the following Greek Works :—The Gospel of St. John, the Menippus of Lucian, or a book of Xenophon's Anabasis; also in Latin, First and Second Books of the Æneid of Virgil, the Jugurthine War of Sallust, or Third Book of Livy. Candidates will also be required to write English from Dictation, and to give evidence of proficiency in Arithmetic.

THE FELLOWSHIP.

Every Registered Pupil or Licentiate shall be admitted to examination for the Fellowship, if he shall have laid before the Council the following documents :—

a. A receipt, showing that he has lodged in the Bank of Ireland the sum of ten guineas for a Licentiate, or twenty-five guineas for a Registered Pupil; provided in either case he intends to reside beyond ten miles from Dublin. Should he intend to reside in Dublin, or within ten miles thereof, he shall lodge, if a Licentiate, twenty guineas; or if a Registered Pupil, thirty-five guineas.

b. Certificates that he is twenty-five years of age.

c. That he is a Bachelor of Arts of some University, or has been examined to ascertain that he has obtained a liberal preliminary education.

d. A Certificate, signed by two Fellows of the College, of good conduct during his professional education.

e. That he has been engaged in the acquisition of professional knowledge for six years, during three of which he must have studied in one or more of the recognized Schools and Hospitals. He may have studied for the other three years in an approved school of the United Kingdom or in any foreign school of repute. It is also required that he shall have had practical instruction, as House-Surgeon or Dresser, in a recognized Hospital.

f. Of attendance on the Courses of Lectures required for Letters Testimonial, together with one course on Comparative Anatomy, one on Botany, and one on Natural Philosophy.

g. A thesis on some medical subject or clinical reports, with observations of six or more medical or surgical cases taken by himself.

h. Candidates of the required age, who shall have taken the degree of Bachelor of Arts, will be admitted to examination at the end of five years of professional study, of which three must have been passed in one or more of the recognized Schools or Hospitals.

i. Licentiates who may not be able to show that they have fulfilled the preceding regulations, may, after ten years from the date of their diploma, be admitted to the Fellowship examination, provided they produce evidence that they have conducted themselves honourably in the practice of their profession.

LETTERS TESTIMONIAL.

Every Registered Pupil shall be admitted to an examination for Letters Testimonial if he shall have laid before the Council the following documents :—

a. A receipt showing that he has lodged twenty guineas in the Bank of Ireland.

b. A certificate from the Examiners that he has passed an examination as to his acquaintance with Greek and Latin.

c. Certificates showing that he has studied his profession for not less than four years.

d. Certificates of attendance on a recognized Hospital during three years.*

e. Certificates of attendance on the following lectures :—
Three Courses.—Anatomy and Physiology; Theory and Practice of Surgery; Dissections, with Demonstrations.

Two Courses.—Chemistry (or one on general and one on Practical Chemistry); Materia Medica; Practice of Medicine.

One Course.—Midwifery; Medical Jurisprudence; Botany.

DIPLOMA IN MIDWIFERY.

Any Fellow or Licentiate shall be admitted to an examination for the Diploma in Midwifery upon laying before the Council the following documents :—

a. Certificates that he has attended one course of lecture on Midwifery and Diseases of Women and Children, delivered by a Professor or Lecturer in some recognized School.

b. That he has attended a recognized Lying-in Hospital for six months; or a recognized Dispensary for lying-in women and children, devoted to this branch of surgery alone.

c. That he has conducted thirty labour cases. Candidates for the Midwifery Diploma shall be examined on the organization of the female; the growth and peculiarities of the fœtus; the practice of Midwifery, and the diseases of women and children.

REGULATIONS AS TO EXAMINATIONS.

Letters Testimonial.

The examinations for Letters Testimonial shall be held from time to time, as the Council may direct. Five Examiners at least shall be present. Each candidate shall be examined upon Anatomy, Physiology, the Theory and Practice of Medicine and Surgery, Materia Medica and the form of prescription, and shall perform such surgical operations or dissections, or explain such anatomical and pathological preparations as the Examiners may require.

Candidates for Letters Testimonial, being Licentiates of College of Physicians or Graduates in Medicine of a University shall be examined in general and descriptive Anatomy, Physiology, the Theory and Practice of Surgery, and Operative Surgery. Candidates whose answering shall be found insufficient will not be allowed to present themselves a second time until after the expiration of six months. In addition to the oral examinations, Candidates for Letters Testimonial shall subsequent to the 1st of May, 1863, be required to give written answers to written or printed questions, to be delivered to them in such a manner as the Council may direct.

Fees to be paid by Candidates for Letters Testimonial.

1st. The Candidate pays Ten Shillings for his Preliminary Examination.

2nd. Five Guineas as Registered Pupil of the Colleges.

3rd. Five Guineas for the Junior Class Examination, which is not returned in case of rejection, but is allowed in the fee for his Second Examination.

4th. Fifteen Guineas for Senior Class Examination—total 26l. 15s.

FELLOWSHIP.—Examinations for the Fellowship shall be held at stated periods, as the Council may direct. Five Examiners at least, together with the President, or Vice President, and two members of the Council, shall be present. Each Candidate shall be examined on two days. The subject of the first Examination shall be Anatomy and Physiology (human and comparative); those of the second, Pathology Therapeutics, the Theory and Practice of Medicine and Surgery. In addition to the oral examinations Candidate shall be required to give written answers to written questions. The Candidates shall also perform dissections and operation on the dead body. Candidates whose answering shall be found insufficient will not be allowed to present themselves a second time until after the expiration of one year.

DIPLOMA IN MIDWIFERY.—The examination shall be conducted by the Examiners in Midwifery. Such examination shall be held, from time to time, as the Council may direct. Should a Candidate be rejected, he shall not again be admitted to an examination until a period of three months shall have elapsed; and he then shall be obliged to produce evidence of his having been engaged in the study of this branch of Surgery subsequent to such rejection.

DIPLOMA IN MEDICINE.

The College also grants to its own Licentiates, without an further fee, a Diploma, testifying that such Licentiates are qualified to practice Medicine as well as Surgery, and that they are legally qualified Medical Practitioners.

* ATTENDANCE ON PROVINCIAL HOSPITALS.—Candidates for Letters Testimonial, who shall have attended recognized Hospitals during three Winter Sessions of six months each, shall be considered to have performed sufficient Hospital Attendance, if they shall be able to produce Certificates of regular daily attendance during a like number of months at a County Infirmary, or Provincial Surgical Hospital, containing at least fifty beds, provided the Surgeons of such Infirmaries or Hospitals shall make returns to this College, in the months of May and November in each year, of the number of Students so attending.

UNIVERSITY OF DUBLIN.

PROFESSORS IN THE FACULTY OF MEDICINE.

Physic.—Dr. W. Stokes, Regius Professor.
 Anatomy and Physiology.—B. G. McDowel, F.R.C.S.I.
 Surgery.—R. W. Smith, M.D.
 Medicine.—J. Banks, M.D.
 Midwifery.—Dr. Sinclair.
 Chemistry.—J. Apjohn, M.D.
 Botany.—Vacant.

Materia Medica.—Dr. A. Smith.
 Institute of Medicine.—Robert Law, M.D.
 Medical Jurisprudence.—Dr. Travers.
 The following Degrees and Licences in Medicine and Surgery are granted by the University of Dublin :—
 1. Bachelor in Medicine. 2. Doctor in Medicine. 3. Master in Surgery. 4. Licentiate in Medicine. 5. Licentiate in Surgery.

Matriculation.

Every Student must be matriculated by the senior Lecturer, for which a fee of five shillings is payable; but he need not give his name on the College books, or to attend any of the academical duties, unless he desire to obtain a Licence or Degree in Medicine or Surgery. No Student can be admitted for the Winter Courses after the 25th of November.

QUALIFICATIONS FOR DEGREES AND LICENCES.

Bachelor in Medicine.

Candidates must be Graduates in Arts, and may obtain the Degree at the same Commencements as the B.A., or at any subsequent one. The medical education of a Bachelor in Medicine is of four years' duration, and comprises the following Lectures :—

Six Months Courses.—Anatomy and Physiology—Practical Anatomy with Dissections—Surgery—Chemistry—Materia Medica and Pharmacy—Institutes of Medicine and Pathology—Practice of Medicine—Midwifery.

Three Months Courses.—Botany—Practical Chemistry—Medical Jurisprudence.

Hospital attendance on St. Patrick Dun's during nine months, with three consecutive Courses of Clinical Lectures. Also nine months' attendance on a recognized Hospital.

Two of the Courses may be attended at any recognized Medical School, and three of them at Edinburgh University, provided the Candidate have kept an Annus Medicus in the School of Physic.

The Schools recognized are :—1. The School of the Royal College of Surgeons in Ireland. 2. The Carmichael School. 3. The School of Steevens' Hospital. 4. The Ledwich School. 5. The Cecilia street School.

An Annus Medicus may be kept in three ways :—1. By attending two courses of six months' duration. 2. Or one of six months' and two of three months' duration. 3. By nine months' attendance on Sir Patrick Dun's Hospital and Clinical Lectures; together with one course of six months' or two courses of three months' duration.

The Fee for nine months' attendance at Sir Patrick Dun's Hospital is twelve Guineas.

The Fee for each Course of Lectures is three guineas.

The Fee for the *Liveat ad Examinandum* is 5*l.*

The Fee for the Degree of M.B. is 10*l.*

Doctor in Medicine.

A Doctor in Medicine must be M.B., of at least three years' standing, and requires no other qualification.

Total Fees for this Degree, 12*l.*

Master in Surgery.

This Degree can only be obtained by Bachelors of Arts. The curriculum is the same as that for the Licentiate in Surgery, as given below.

Candidates will also be required to perform Surgical operations on the dead subject.

Total amount of Fees for the Degree of Ch. M., 15*l.*

Licentiate in Medicine.

Candidates for the Licence in Medicine and Surgery must be matriculated in Medicine, and must have completed four years in Medical studies, and must pass an Examination in Arts, unless they be Students in the Senior Freshman, or some higher class. The Medical Course necessary for a Licence in Medicine is the same as for the Degree of M.B. A fee of 5*l.* is charged on taking the Licence. Licentiates in Surgery of the Royal College of Surgeons in Ireland, on passing the Art Examination, will be admitted to Examina-

tion for the Licence in Medicine. Such Candidates will be exempted from Examination in Anatomy and Surgery; and Candidates who have also the Licence in Midwifery of the said College will be exempted from examination in Midwifery. Fee for the *Liveat ad Examinandum*, 5*l.* Fee for the Licence in Medicine, 5*l.*

Licentiate in Surgery.

Candidates must have kept one full year in Arts and will be required to perform surgical operations on the dead subject. The curriculum extends over four years, and is as follows :—Two courses each of Anatomy and Physiology, and Theory and Practice of Surgery; three courses of Demonstrations and Dissections; and one course each of Practice of Medicine, Chemistry, Materia Medica, Midwifery, Practical Chemistry, Botany, and Medical Jurisprudence. Also attendance for three Sessions, each of nine months', on a recognised Hospital. Of the courses of Lectures, which are of six months' duration, not more than three can be attended during any one Session. Any of the above-named courses may be attended at any of the Medical Schools of Dublin, provided the Candidate has kept an *Annus Medicus*. A fee of 5*l.* is charged for the Licence, and 5*l.* for the *Liveat*.

SESSIONAL EXAMINATIONS.

Candidates for Degrees and Licences will be subjected to two examinations, one of them preliminary, which will be held at the close of the second year, and the other, after the full curriculum has been completed. The subjects of the preliminary examination are the following: Descriptive Anatomy, Botany, and Materia Medica, Pharmacy, Chemistry, theoretical and practical, with Chemical Physics. The best answers at the preliminary examination will be elected to the scholarships, provided they are in the Senior Freshman, or some higher class, and have kept one *Annus Medicus*.

PRIVILEGES OF MEDICAL STUDENTS.

Medical or Surgical Students, being junior or senior Sophisters, and in attendance on the full courses necessary for an *Annus Medicus* are exempted from the classics of the Junior Sophister year, and from one of the three optional courses (Mathematical Physics, Experimental Physics, or Classics) of the Senior Sophister year. To obtain this privilege the Student must be matriculated, and the Certificate of his attendance on Lectures be submitted to the Senior Lecturer.

FREE COURSES.

Students in Arts, having their names on the College books, will be permitted to attend one course free of expense, with each of the University professors. Should the Student who has had the privilege of free attendance desire to obtain an official testimonium, he must, on obtaining it, pay to the professor the usual fee.

MEDICAL SCHOLARSHIPS.

Two Medical Scholarships are given annually, value 20*l.* per annum each, tenable for two years, the Examinations for which are held each year in June, in the following subjects :—Anatomy, Physiology, Chemistry, Materia Medica and Botany.

Medical School Exhibitions.

The Professors of the University School give three Exhibitions annually, two Senior, value 15*l.* and 10*l.*, open to all Students who have been three years attending the School. The Subjects being—Practice of Medicine, Surgery, Pathology, and Forensic Medicine.

One Junior, value 15*l.*—The time and subjects of Examination being the same as those for the Medical Scholarships.

Expense of obtaining the Degrees of Bachelor in Medicine and Master in Surgery in the University of Dublin :—

Lectures	£47 5 0
Hospitals	31 10 0
Degree Fees	20 0 0
Examination Fees	10 0 0

£108 15 0

Private Tuition, say 20 0 0

£128 15 0

N.B.—As no Degree in Medicine or Surgery are conferred except upon Graduates in Arts, the expense of the Degree of Bachelor in Arts, amounting altogether to 82*l.* 4*s.*, should be added to the foregoing, making the total cost something over 200*l.*

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

REGULATIONS RESPECTING THE LICENTIATESHIP IN MEDICINE.

CANDIDATES for the Licentiateship must make application for permission to be examined according to the form supplied by the Registrar.

Candidates must deposit a Certificate of having lodged the admission fee in the Bank of Ireland.

Candidates must give proof of having attained the age of twenty-one, of four years' study of Medicine at a recognized School or Schools; and of having studied the following subjects—viz., Anatomy, Physiology, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica and Botany, Practical Jurisprudence, Practice of Medicine and Pathology, Surgery, Midwifery.

Of having attended a Medico-Chirurgical Hospital, with Clinical Lectures, together with Clinical Instruction, for twenty-seven months (or such hospital for eighteen months with nine months at a Medical Hospital), the attendance being for not more than nine months in any year, and both hospitals not being taken out in the same year.

Of six months' Practical Midwifery at a recognized lying-in hospital, or other evidence of having attended Practical Midwifery.

Candidates not personally known to a Fellow of the College must transmit Testimonials of character from registered Physicians or Surgeons. Those of public hospitals or infirmaries being preferred.

SESSIONAL EXAMINATIONS.

Students are recommended to divide their study into two Periods, of two years each; the first, Anatomy and Physiology, Surgery, Chemistry, Botany and Hospital Attendance.

The second to comprise Practice of Medicine, Materia Medica, Medical Jurisprudence, Midwifery, and Hospital Attendance.

The Examination is divided into two parts:—

First Part.—Anatomy, Physiology, Botany and Chemistry.

Second Part.—Materia Medica, Practice of Medicine, Medical Jurisprudence, and Midwifery.

Students may be examined in the first part at the termination of the first period of study; or in all the subjects on the completion of their studies.

Candidates must have passed the Preliminary Examination in Arts previous to or within the first two years of their studies; or must have passed an Examination in General Education by some of the qualifying or National Educational Bodies:—Preliminary Examinations in Arts will be held at the College, on the second Saturday in the months of October, January, April, and July, at twelve o'clock. The following are the subjects of each examination:—English: Composition, and Writing to Dictation, Modern Geography, and English History. Greek: Homer's Iliad, Book I.; or Xenophon's Anabasis, Book I.; or Walker's Lucian, Dialogues I.—XI., at the option of the Student. Latin: Virgil's Æneid, Books I. and II.; or Sallust; or Cæsar, "De Bello Gallico," Books I. and II., at the option of the Student. Mathematics: Euclid, Books I. and II.; and Arithmetic, to the end of Decimal Fractions.

Students in Arts of one year's standing, of a University; Graduates or Licentiates in Medicine or Surgery of any University or College will be exempted from this Examination.

These regulations will not apply to Candidates who have commenced previously to January, 1861.

Candidates qualified as follows are required to undergo the second part of the professional Examination only—viz., 1. Graduates in Medicine of a University. 2. Fellows, Members, or Licentiates, of the Colleges of Physicians of London or Edinburgh, admitted upon Examination. 3. Graduates or Licentiates in Surgery.

If the President and Fellows be not satisfied with the answering of a Candidate, they may admit him to re-examination, after a lapse of two months.

The Examinations are open to all Fellows and Licentiates of the College. Every Candidate, before being admitted as a Licentiate, must subscribe the following declaration:—

"I do hereby solemnly and sincerely promise that I will observe the Statutes and Bye-laws of this College, and to my power endeavour that the honour of the College be preserved entire; and in all things that belong to the honour or profit thereof, I shall be ready to give my advice and assistance.

"I hereby authorize the President and Fellows of the King and Queen's College of Physicians in Ireland to erase my

name from the list of Licentiates, and I consent to surrender the Diploma received from the College, if I shall, after having obtained the Licence of said College, either Compound or Dispense Medicine for sale, or engage in any trade in any part of the United Kingdom.

"I engage not to endeavour to obtain practice, or to attract public notice, by any unworthy means; I also engage that I will neither permit nor sanction the use of my name by any other person for such purposes, nor in connexion with an secret remedy; and in case of any doubt relative to the true meaning or application of this engagement, I promise to submit to the judgment of the College.

"And I solemnly and sincerely declare, that should I violate any of the conditions specified in this Declaration, so long as I shall be either a Licentiate or Fellow of the College, I thereb render myself liable; and shall submit, to censure of the College or to expulsion and surrendering of the Diploma, whichever the President and Fellows of the College shall think proper to inflict."

If the applicant be an Apothecary, he must surrender his Certificate as such; and, if admitted, must not be Registered as an Apothecary.

The following is the form of the Diploma:—

"We, the President and Fellows of the King and Queen College of Physicians in Ireland, have duly and deliberately examined _____ in the Principles and Practice of Medicine and in the accessory Sciences, and having found him well versed therein, do by these presents grant him a Licence to practise in the Faculty of Physic, and do hereby certify that he is a Physician and Licentiate in Medicine of said College "In testimony whereof," &c. &c.

REGULATIONS RESPECTING THE LICENCE IN MIDWIFERY.

Members of the College desiring to obtain the Licence in Midwifery must undergo a special Examination, and, if approved, shall be distinguished as Practitioners in Midwifery in the Lists of the College.

Candidates for the Licence in Midwifery, not Members, will be admitted to Examination on the following qualifications:—The Degree or Licence in Medicine or Surgery from any University or College, together with a Certificate of six months' Lectures on Midwifery, with six months at a recognized Lying-in Hospital, or of having attended Practical Midwifery for six months at a recognized Lying-in Hospital, or other evidence of having attended Practical Midwifery.

FEES FOR LICENCE AND EXAMINATIONS.

The Fee for the Licence is 15*l.* 15*s.*; which may be divided as follows:—

For Examination at the termination of the first period of Study, 5*l.* 5*s.*

For final Examination for the Licence, 10*l.* 10*s.*

Fee for the Midwifery Diploma, 3*l.* 3*s.*

Fee for the Preliminary Examination in Arts, 10*s.*

The following Regulations relative to the Licence in Midwifery were adopted by the College on the 10th of March, 1865:—Fee for the Licence in Medicine and Midwifery, if taken out at the same time, 16*l.*

The Admission Fee, with the exception of 2*l.* 2*s.*, is returned to any rejected Candidate; and the Admission Fee, with the exception of 1*l.* 1*s.*, is returned to any rejected Candidate for the Licence in Midwifery; but in the case of a rejected Candidate afterwards passing within twelve months, the sum previously deducted is allowed in the fee paid for such second Examination.

THE QUEEN'S UNIVERSITY IN IRELAND.

FACULTY OF MEDICINE.

DEGREE OF DOCTOR OF MEDICINE.

EACH Candidate for the Degree is required—

1. To have passed in one of the Queen's Colleges the Examination for Matriculation in Arts, and to have been Matriculated in Medicine. 2. To have attended in one of the Queen's Colleges, Lectures on one Continental Language for six months, and on Natural Philosophy for six months. 3. To have attended, in some one of the Queen's Colleges, three of the courses marked with an asterisk in the list below. For the remainder of the courses, certificates will be received from the Lecturers in Schools, recognised by the Senate. 4. To pass two University Examinations—the First University Examination and the Degree Examination.

The curriculum of Medical study extends over four years, and is divided into two periods of two years each.

The First Period comprises attendance on Chemistry,

natural History, Anatomy and Physiology, Practical Anatomy, Materia Medica, and Pharmacy. Practical Chemistry in a recognised Laboratory is also to be attended during the first Period, and the Practice during six months of a Medico-Chirurgical Hospital, containing at least sixty beds, together with the Clinical Lectures delivered therein.

The Second Period comprises attendance on Anatomy and Physiology, Practical Anatomy, Theory and Practice of Surgery, Midwifery and Diseases of Women and Children, Theory and Practice of Medicine, Medical Jurisprudence. During this period Students attend Practical Midwifery and eighteen months' practice of a Medico-Chirurgical Hospital, containing at least sixty beds, and in which Clinical Instruction is delivered.

At least two of the above Courses of Lectures must be attended in some one of the Queen's Colleges; the remainder may be taken at the option of the Candidate, in any University, College, or School recognised by the Senate of the Queen's University. Candidates are required, before graduating, to have also attended in one of the Colleges of the University, Lectures on Natural Philosophy, and on one Modern Language, and to have passed the Matriculation Examination. There are two University Examinations: one comprising the subjects of study in the First Period, the other the subjects of the Second Period. The University Examinations are held twice in each year, in June and September.

The June Examinations are Pass Examinations, and commence on the Tuesday following the second Saturday in June. The Honour Examinations commence on the last Tuesday in September, and are followed by Pass Examinations.

Each Candidate for Examination in June must forward to the Secretary, before the 1st of June, notice of his intention to offer himself, along with his Certificates; and each Candidate for Examination in September or October must forward similar notice, along with his Certificates, before the 1st of September.

THE FIRST UNIVERSITY EXAMINATION IN MEDICINE.

The First Examination may be passed either in June or September.

Students may present themselves for this Examination at the termination of the First Period of the Curriculum, or at any subsequent period.

Before being examined, each Candidate must produce evidence of having completed the course recommended for study during the First Period.

The First University Examination comprises the subjects recommended for study during the First Period, along with which any Candidate may present himself for Examination in Experimental Physics and Modern Languages, if he has attended in one of the Queen's Colleges the Courses on these subjects.

The Examination will be conducted principally by printed papers, to which written answers shall be given, but the Examiners are at liberty to add *visa voce* examination, and to call for demonstrations and experiments.

English Composition forms a part of all University Examinations.

HONOURS.

Competitors for Honours will be examined in all the subjects of the First Medical Examination, including Experimental Physics and Modern Languages.

Two Exhibitions, one consisting of two instalments of 20*l.* each, the other of two instalments of 15*l.* each, will be awarded to the best answerers, if they be recommended by the Examiners as possessed of sufficient absolute merit.

The Candidates who pass with Honours will be arranged in three classes.

Candidates who defer passing their First Medical Examination until they present themselves at the Degree are not eligible for Honours with the First Examination.

The Honour and Pass Examinations will be held in September. The Examination held in June is a Pass Examination.

DEGREE EXAMINATIONS IN MEDICINE.

Examinations for the M.D. will be held in June and September. The Fee is 5*l.*

Each Candidate must be recommended by the President of his College, and produce—

1. A Certificate from the Secretary of the Queen's University, that he has passed the previous Examination, unless he presents himself for both examinations simultaneously.
2. From the Council of his College that he has passed a full Examination for Matriculations for Arts, and has been admitted a Matriculated Student in the Faculty of Medicine.

3. That he has attended in the Colleges three of the courses marked with an asterisk above, lectures on one Modern Language, and on Experimental Physics.
4. That he has completed all other prescribed Courses.

The Degree Examination comprises the subjects recommended for study during the second period, along with Experimental Physics and one Modern Language, unless an Examination in these subjects have been already passed at the previous Medical Examination.

The Examination for the Degree of M.Ch. comprises in addition an examination in Operative Surgery.

Candidates for the Degree of Master in Surgery, who obtained the Degree of M.D. in this University before the 1st of January, 1865, will be exempted from the examination in Operative Surgery.

Candidates who graduate with Honours will be arranged in three classes; the names in each class will be placed alphabetically. Candidates who take a first Class will receive a Medal and Prize. Candidates who take a second Class will receive a Prize. Candidates who take a third class will receive a Certificate of Honour.

The Examination for the Degree with Honours will commence on the last Tuesday in September, and will be followed by the Examination of those Candidates who seek to graduate without Honours.

The Examination held in June is a pass Examination.

THE APOTHECARIES' HALL OF IRELAND.

REGULATIONS REGARDING THE LICENCE.

EVERY Candidate is required to undergo a Preliminary and a Professional Examination.

THE PRELIMINARY EDUCATION AND EXAMINATION

include—1. English; 2. Mathematics; 3. French; 4. Latin; 5. Greek; 6. Natural Philosophy; 7. Natural History.

A Preliminary Examination will be held at the Hall four times in the year—viz., on the third Friday in the months of January, April, July, and October, at two o'clock p.m. This Examination will be conducted by Graduates in Arts of the University of Dublin, with Assessors from the Court of the Hall.

Unsuccessful Candidates will not be re-admitted to Examination until after six months.

Certificates in Arts granted by any of the Bodies named in the Medical Act, or by any Educational Institution approved of by the Medical Council, will be recognized.

THE PROFESSIONAL EDUCATION.

Every Candidate for the Licence to Practise must produce Certificates—1. Of having passed an Examination in Arts previous to Professional study. 2. Of being Registered as a Student in Medicine by one of the Bodies named in the Medical Act. 3. Of being twenty-one years of age, and of good moral character. 4. Of Apprenticeship to a qualified Apothecary, or of having been engaged at Practical Pharmacy with an Apothecary for three years subsequent to having passed the Examination in Arts. 5. Of having spent four years in Professional study. 6. Of having attended the following Courses—viz., Chemistry, one winter session; Anatomy and Physiology, two winter sessions; Demonstrations and Dissections, two winter sessions; Botany and Natural History, one summer session; Materia Medica and Therapeutics, one summer session; Practical Chemistry, three months; Principles and Practice of Medicine, one winter session; Midwifery and Diseases of Women and Children, six months; Practical Midwifery at a recognised hospital (attendance upon twenty cases); Surgery, one winter session; Medical Jurisprudence, one summer session; Instruction in the Practice of Vaccination. 7. Of having attended at a recognised hospital the Practice of Medicine and Clinical Lectures during two winter and two summer sessions; also the Practice of Surgery and Clinical Lectures, one winter and one summer session.

CERTIFICATE OF ASSISTANT.

Candidates for the Certificate of Assistant to an Apothecary must have completed at least three years of his Apprenticeship, or have a certificate from an Apothecary of having been engaged at Practical Pharmacy for three years, together with a Certificate of good moral character.

The Examination of the intended Assistant will be restricted to the British Pharmacopoeia and to Pharmacy, scientific and practical, including the history and character of Medicines, their preparation, combination, and doses, and the translation of Latin Prescriptions.

SCHOOLS OF MEDICINE IN IRELAND.

ROYAL COLLEGE OF SURGEONS. SCHOOL OF SURGERY—
WINTER SESSION.—Anatomy and Physiology: Dr. Jacob. Descriptive Anatomy: Dr. Bevan and Mr. Morgan. Surgery: Messrs. Hargrave and Hughes. Practice of Medicine: Dr. Benson. Chemistry: Dr. Barker. Midwifery: Dr. Sawyer. Comparative Anatomy: Dr. Jacob. Dissections under the direction of the Professors of Anatomy, assisted by the Demonstrators, Mr. Cruly, Dr. Stoney, and Mr. Macalister. **SUMMER SESSION.**—Materia Medica: Dr. Macnamara. Medical Jurisprudence: Dr. Geoghegan. Botany: Dr. A. Mitchell. Practical Chemistry: Dr. Barker. Hygiene: Dr. Mapother. A Public Course of Lectures on Comparative Anatomy and Zoology, free to all students, is delivered by the Professor of Anatomy and Physiology, at the commencement of the session, and additional Lectures on the same subject at intervals during the winter. Operative Surgery by the Professors of Surgery, separate from the Surgical Lectures. The Professor of Chemistry receives operating pupils into the Chemical Laboratory. The Professor of Botany will commence a course of Lectures on Structural and Physiological Botany in February. This course, taken in conjunction with that on Comparative Anatomy and Zoology, by the Professor of Anatomy and Physiology, constitutes the course of Natural History required by the Army Medical Board. (For particulars of Fees, &c., see Class-list and advertisements).

SCHOOL OF PHYSIC, TRINITY COLLEGE, DUBLIN.—The School was established by Act of Parliament 40th George III., and is under the joint government of the Board of Trinity College, and the King and Queen's College of Physicians. Institutes of Medicine and Pathology—Prof. Law. Materia Medica and Pharmacy—Prof. A. Smith. Surgery—Prof. R. Smith. Anatomy and Physiology—Prof. MacDowel. Practical Anatomy—Drs. Barton and Bennett. Chemistry—Prof. Apjohn. Practice of Medicine—Prof. Banks. Midwifery and the Diseases of Woman and Children—Prof. Sinclair. Medical Jurisprudence—Prof. Travers. Dissections superintended by the University Anatomist, and Demonstrators. (For Prizes, Fees, see Daily Class List and Advertisements).

LEDWICH SCHOOL OF ANATOMY, MEDICINE, AND SURGERY, Peter street, Dublin.—Founded 1810.—This School, claiming priority of foundation before any of its kindred unchartered institutions were projected, was established in 1810 by J. Kirby. Anatomy, Physiology, Pathology, &c.: Mr. E. Ledwich and Dr. T. P. Mason. Theory and Practice of Surgery: Mr. Wharton. Surgical and Descriptive Anatomy, Demonstrations and Dissections: Messrs. T. P. Mason, E. Ledwich, Booth, Leney, Bright and O. Leary. Theory and Practice of Medicine: Dr. W. Moore. Midwifery and Diseases of Women and Children: Dr. J. Ringland. Materia Medica and Therapeutics: Dr. R. Minchin. Forensic Medicine and Hygiene: Dr. R. Travers. Chemistry, Practical Chemistry, and Natural Philosophy: Dr. R. Cameron. Botany: Dr. C. Asken.

DR. STEVENS'S HOSPITAL AND MEDICAL COLLEGE. Established 1820.—Cons.—Phys.: Dr. C. P. Croker. Phys.: H. Freke and W. M. Burke. Cons.—Surgs.: Messrs. S. G. Wilmot and C. Fleming. Surgs.: Messrs. W. Colles, E. Hamilton, and G. R. Symes. Res. Surgs.: Mr. G. St. G. Tyner. Phys.—Acc.: Dr. S. L. Hardy. Asst. Phys. Aces: Messrs. J. C. Purcell and R. A. Caldwell. Demont. of Anat.: Messrs. R. Swan and L. Eades. Apoth.: Mr. M. Savage. Cur. Mus.: Mr. R. L. Swan. The Hospital contains 250 beds, and is provided with distinct wards for the treatment of fevers, syphilis, diseases of the eyes, and diseases of females. Average number of in-patients, 230 per diem; out-patients, 450 a week. Surgical Operations are performed on Saturdays at ten o'clock. Ophthalmic Surgery: Patients labouring under diseases of the eye are attended to on Saturdays at nine o'clock. Midwifery: A maternity department, for the delivery of lying-in women at their own homes, is conducted under the superintendence of the physician-acconcheur. Clinical Lectures are delivered on four days in the week, and Pathological Demonstrations by the Lecturers, as opportunity offers. **MEDICAL SCHOOL.**—Descriptive Anatomy: Dr. G. R. Symes. Physiology: Dr. E. Hamilton. Practice of Medicine: Dr. Freke. Surgery: Messrs. Colles and Wilmot. Chemistry: Dr. Cameron. Materia Medica: Dr. Gordon. Dissections and Demonstrations, by the Professors of Anatomy and Physiology, assisted by the Demonstrators. Summer Lectures: Lectures

are delivered during the summer session on Materia Medica, Practical Chemistry, Medical Jurisprudence, Comparative Anatomy, and Botany. (For particulars of Fees, &c., see Advertisement).

CARMICHAEL SCHOOL (FORMERLY RICHMOND HOSPITAL SCHOOL) OF ANATOMY, MEDICINE AND SURGERY, North Brunswick street, Dublin. Founded 1828.—Anatomy and Physiology: Mr. H. Curran and Dr. W. Stokes, jun. Surgery and Operative Surgery: Dr. R. McDonnell. Medicine: Dr. R. Cruise. Midwifery and Diseases of Women and Children: Dr. Jennings. Materia Medica and Pharmacy: Dr. Frazier. Chemistry: Dr. Davy. Descriptive and Practical Anatomy: Dr. Corley and Dr. O'Grady. Medical Jurisprudence: Dr. O'Reilly. Botany: Dr. Campbell.

CATHOLIC UNIVERSITY, DUBLIN, Cecilia street, Dame street.—**WINTER SESSION.** Anatomy and Physiology: Dr. Hayden and Cryan. Anatomical Demonstrations by the Professors of Anatomy and Physiology. Chemistry: Dr. W. R. Sullivan. Surgery: Mr. A. Ellis. Medicine: Dr. R. D. Lyons. Midwifery: Dr. J. A. Byrne. Demonstrations in Dissecting Rooms: Messrs. H. J. Tyrrell, P. J. Hayes, R. Fennelly, M. Darby, R. E. Hogan, and — Laffan. **SUMMER SESSION.** Practical Anatomy: Dr. W. K. Sullivan. Materia Medica: Dr. I. B. Quinlan. Medical Jurisprudence: Dr. S. M. McSwiney. Pathology: Dr. R. D. Lyons. Botany: ———. Natural Philosophy: Mr. H. Hennessy. Logic: Dr. D. B. Dunne.

CITY OF DUBLIN HOSPITAL, Upper Baggot street. Founded 1832; Enlarged 1851.—Phys. and Surgs.: Dr. A. Jacob, Dr. T. E. Beatty, Dr. C. Benson, Mr. W. Hargrave, Dr. T. C. Geoghegan, Mr. J. Tufnell, and Mr. H. G. Croly. Cons. Phys.: Prof. Apjohn and Dr. Croker. Asst. Ophth. Surg.: Dr. A. H. Jacob. Dental Surgeon: Mr. F. McClean, jun. Res. Apoth.: Mr. Hewett. The Hospital contains 104 beds, and its annual average number of in-patients is 800; out, 11,700. Special wards are appropriated for the reception of Ophthalmic cases, and for the Diseases of Females. Clinical Lectures are delivered after the Hospital visit. Certificates of Attendance on this Hospital are recognised by all the Colleges, Universities, and Halls, and by the Army and Navy Medical Boards. (For further particulars, see Advertisement).

MEATH HOSPITAL AND COUNTY OF DUBLIN INFIRMARY.—Two Medical and Two Surgical Clinical Lectures will be delivered each week. The Medical Clinical Instruction is given by Drs. W. Stokes and A. Hudson. The Surgical, by Messrs. Porter, M. H. Collis, J. H. Wharton, P. C. Smyly, Rawdon Macnamara, and W. Stokes, jun. (For further particulars see Advertisement).

THE ADELAIDE HOSPITAL, Peter street, Dublin.—Phys. Drs. J. F. Duncan and H. H. Head. Surgs.: A. J. Walsli M.D., J. Morgan, J. K. Barton, M.D., and B. Wills Richardson. Apoth.: Mr. Lyon. Asst. Sec.: Mr. J. Reid. This Hospital contains 100 beds, of which 24 are devoted to the Special Diseases of Infants and Children. There is a detached Fever Hospital for the treatment of Contagious Diseases. Two Medical and two Surgical Lectures, including Lectures on the Diseases of the Eye, will be delivered in each week, besides instruction being given daily by the Physicians and Surgeons. Practical Demonstrations in the use of the Stethoscope and Microscope, as applied to the diagnosis of disease, will be given during the Session. (For further particulars, see Advertisement.)

MERCER'S HOSPITAL, William street Dublin. Established 1734.—The Hospital stands in the immediate vicinity of four of the principle Medical Schools, and is recognised by a Licensing Bodies. Its average number of in-patients is 50 out, 150, per diem. The Clinical Instruction and Lectures will be delivered. On Medicine, by Drs. W. Moore, and T. P. Mason. On Surgery, by W. Jameson, M.D., P. Bevan, M.D., R. G. H. Butcher, M.D., and E. Ledwich. (For further particulars see Advertisement.)

JERVIS STREET HOSPITAL, Dublin.—Phys., Drs. R. D. Lyon and S. M. Macswiney; Surgs., Messrs. R. P. O'Reilly, M. H. Stapleton, M.D., A. Banon, M.D., J. S. Hughes, M.D., J. K. Forrest, H. J. Tyrrell, and R. McDonnell. Medical and Surgical Clinical Lectures will be delivered on three mornings in the week, and due notice of operations will be given, unless in cases of emergency. Certificates of Attendance at this Hospital are recog-

ed by the King and Queen's College of Physicians, the Queen's University, the University of Edinburgh, the Army, Medical, Navy, and East India Boards, and by all the licensing bodies in the Kingdom. For further particulars see advertisement.

MATER MISERICORDIÆ HOSPITAL.—Eccles street, Dublin. Established 1861. Phys.: Drs J. Hughes and T. Hayden. Surgs.: Messrs R. P. O'Reilly, A. Ellis, M. H. Stapleton, and R. Cruise. Apoth.: Mr Moore. Hon. Sec.: Dr F. R. Cruise. The portion of this Hospital now completed contains 100 beds. Three Clinical Lectures will be delivered in each week. Surgical Operations performed on Saturday morning. Connected with the Hospital is an extensive Dispensary. (For further particulars see advertisement.)

ST. VINCENT'S HOSPITAL, STEPHEN'S-GREEN, DUBLIN.—INTER SESSION. Med. Advisers—Mr. J. M. O'Ferrall, Dr. B. Quinlan, and Dr. E. D. Mapother. Asst. Surg., Mr. W. O'Leary. Surg. Dentist—Mr. W. Doherty. Apoth. and Regist.—Mr. D. Dillon. The Hospital, which is on the principle of the hospitals in Paris, contains a 100 beds, constantly occupied by instructive cases. A large ward has been opened for the reception of children, on the plan of the "Eufans alades." Medical and Surgical Clinical Lectures delivered three times a week during the Session, and Clinical instruction daily. Operations performed on Fridays. (For further particulars see advertisement.)

THE COOMBE LYING-IN HOSPITAL.—Masters: Dr. John England and James H. Sawyers. Asst. to Masters: Dr. G. Kidd. Supernumerary Asst. to Masters: Dr. Thomas P. Mason. Cons. Phys.: Drs. D. J. Corrigan, C. P. Croker, and T. Banks. Cons. Surgs.: Messrs. S. G. Wilmot, A. Ellis, H. Porter, and R. G. H. Butcher. Cons. Accs.: Messrs. J. Carmichael, W. Jameson, M.D., and F. Churchill, M.D. Med. Att. Disp.: Dr. W. Carroll. Res. Apoth. and Regist.: Dr. E. J. Devine. The Hospital contains 40 beds; the number of patients annually admitted into the Labour Wards amount to nearly 750, whilst those attended at their own homes from the Hospital considerably exceed double that number.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS.—North Brunswick street, Dublin. The instruction in Clinical Medicine is given by the Physicians, Drs. D. J. Corrigan, J. T. Banks, B. G. McDowell, and S. Gordon. Clinical Surgery by the Surgeons: R. Adams, M.D., Mr. J. Hamilton, R. W. Smith, M.D., and C. Fleming, M.D. Cons. Surg., E. Hutton, I.D. These Hospitals, which are under the control of a Board of Governors appointed by the Lord Lieutenant, contain 12 beds, and have attached to them the Truss Establishment for the relief of the Ruptured Poor of Ireland. Two Medical and two Surgical Clinical Lectures are delivered in each week, in addition to the usual Clinical Instruction, which is given daily by the Physicians and Surgeons. Special Courses of Clinical Instruction are given on Fevers and Epidemic Diseases, Diseases of the Eye, and Mental Diseases, and special certificates awarded. Adjoining these Hospitals is the Carmichael, at the Richmond Hospital School of Medicine, where regular courses of Lectures are delivered on the several subjects of Medical Science. (For further particulars see advertisement.)

LYING-IN HOSPITAL, RUTLAND SQUARE, DUBLIN.—ESTABLISHED 1745. CHARTERED BY GEO. II. Cons. Phys.,—C. P. Croker, M.D.; Cons. Surg., R. Adams M.D.; Master. Dr. J. Denham; Assts. Drs. J. Cronyn and T. Telford; Sec. and Regist., Mr. J. G. Strickland. This Hospital contains 130 beds, 15 of which are appropriated to the Diseases of Females. The annual average number of in-patients is 2,000; out of 2,500.

QUEEN'S COLLEGE, Belfast. Faculty of Medicine.—Anatomy and Physiology, Dr. Redfern; Practical Medicine, Dr. Cuning; Practical Surgery, Dr. Gordon; Chemistry, Dr. Andrews; Materia Medica, Dr. J. Seaton Reid; Midwifery, Dr. Burden; Anatomical Demonstration, Dr. H. Burden; Medical Jurisprudence, Dr. Hodges; Botany and Zoology, Dr. Wyville Thomson. Practical Anatomy and Practical Chemistry, under the superintendence of the Professors. Clinical Lectures will be given during the Session at the Belfast General Hospital by the attendant Physicians and Surgeons; certificates of attendance on which are received as qualifications by the Senate of the Queen's University, and by the various Licensing Boards.

QUEEN'S COLLEGE, CORK.—FACULTY OF MEDICINE. Anat., Physiol., and Pract. Anat., Dr. J. H. Corbett; Pract. of Med.,

Dr. O'Connor; Pract. of Surg., Dr. Tanner; Mat. Med., Dr. O'Leary; Midw., Dr. Harvey; Med. Jurisp. J. Blyth, M.D. and Mr. M. Barry; Nat. Philos., Mr. J. England; Chem. and Pract. Chem., Dr. Blyth; Zoology and Bot. Mr. J. R. Greene; Mod. Language, Prof. R. de Vercuric; Dean of Faculty, Dr. Harvey; Regist. Mr. R. J. Kenny. Practical Anatomy by the Professor of Anatomy and Physiology, assisted by a Demonstrator. Clinical Medicine and Clinical Surgery, at the North and South Infirmary, by the Physicians and Surgeons of these Institutions. Clinical Midwifery at the Lying-in Hospital. Further particulars see advertisement.

QUEEN'S COLLEGE, GALWAY.—FACULTY OF MEDICINE. Anat. and Physiol., and Pract. Anat.: Dr. J. Cleland. Pract. of Med.: Dr. N. Colahan. Pract. of Surg.: Dr. J. V. Brown. Demonstr.: Mr. J. Hill. Mat. Med. and Med. Jurisp.: Mr. S. M'Coy. Midw. and Dis. of Women and Child.: Dr. R. Doherty. Chem.: Dr. T. H. Rowney. Nat. Philos.: Dr. A. H. Curtis. Bot. and Zool.: Dr. A. G. Melville. Logic and Ment. Philos.: Dr. T. W. Moffett. The County Galway Infirmary, Town, and Union Hospitals, are in the immediate vicinity of the Queen's College. They contain upwards of 200 patients, and afford every means of obtaining practical knowledge in both Medicine and Surgery. They are visited every morning by Professors of the College, who deliver Clinical Lectures.

QUEEN' COLLEGE, BELFAST.

The first Matriculation examination will commence on the 19th October. There will be additional Matriculation Examinations on the 14th November, for those who have not been able to present themselves at the first. Lectures will commence on 1st November. No Student can be permitted to enter after the 14th November. Two Junior Scholarships, value 25*l.* each, are awarded to Matriculated Students commencing the first year of their study. The Examination for these will take place immediately after the first Matriculation Examination. Two of similar value to Students of the second year, two to Students of the third year, and two to Students of the fourth year.

For Subjects of examination, and other information, see Queen's College Calendar for 1865. At the termination of the Session, prizes will be awarded for proficiency in the several classes.

The Trustees of the "Charters' Educational Fund," grant annually, for ten years, a sum of 50*l.*, for the purpose of establishing an Exhibition in connexion with the Belfast School of Medicine. The details have not yet been decided upon by the Trustees.

The Anatomical Rooms are open for the entire day, and Students are aided in their dissections by the Professor of Anatomy and the Demonstrator.

Fees.—Practical Chemistry, 3*l.*; Anatomy and Physiology, First Course, 3*l.*, subsequent Course, 2*l.*; Anatomical Demonstrations and Practical Anatomy, each Course, 3*l.*; for subjects each Session, 15*s.*; other Medical Lectures, First Course, 2*l.*, each subsequent Course, 1*l.*

BELFAST GENERAL HOSPITAL.

Physicians.—John Drennan, M.D.; J. W. T. Smith, M.D.; Richard Ross, M.D.; James Cuning, M.A., M.D.

Surgeons.—Saml. Browne, R.N.; Henry Murney, M.D.; Professor Gordon, M.D.; W. MacCormack, M.A., M.D.

This Institution is the only Hospital for the reception of Injuries and Surgical Diseases in Belfast. Four pupils are permitted a residence in Hospital. 30*l.* per annum is the charge for board, &c. The appointments are open to all students attending the Hospital, and are given to the most proficient. Assistant Clinical Clerks and Dressers for the Wards and extern Department are appointed *without any additional Fee.* A Competitive Examination will be held on Saturday, 4th November, at ten a.m., to fill up two vacancies for Resident Pupils.

Fees for Clinical Instruction, including Hospital Fees.—Winter—First Session, 4*l.* 4*s.*; Second, 3*l.* 3*s.*; Third, 3*l.* 3*s.*; Fourth and afterwards, 1*l.* 1*s.*; Perpetual, 12*l.* 12*s.*, he shall not hold a Scholarship in any other University, College or Medical School.

On the 1st day of February, Dr. Smith and Dr. Cuning will take charge of the Medical, and Dr. Murney and Dr. W. MacCormack the Surgical Wards. The Extern Department is visited each morning at Ten o'clock.

A Lecture, introductory to the course of Clinical Instruction, will be delivered by Dr. R. Ross, on Tuesday, the 14th of November, at 10 a.m.

A sum of 400*l.* has been vested in Trustees, by the Widow of A. G. Malcolm, M.D., late Physician of this Hospital, the interest of which is appropriated as an Exhibition, to be competed for annually by the Students attending this Hospital.

QUEEN'S COLLEGE, CORK.

MEDICAL SCHOLARSHIPS.

First Year.—One to the Candidate who shall have most distinguished himself at the Examination for Science Scholarships of the first year in Arts, and one to the Candidate who shall have most distinguished himself at the Examination for Literary Scholarships of the first year in Arts. Candidates for these Scholarships shall have previously declared themselves, and have Matriculated as Medical Students.

Subjects for Second Year.—Anatomy and Physiology, Chemistry, General Physics, Zoology and Botany, the French Language.

Subjects for Third Year.—Anatomy and Physiology, Practical Anatomy, Materia Medica, Practical Chemistry.

Subjects for Fourth Year.—Anatomy and Physiology, Practical Anatomy, Therapeutics, Pathology and Morbid Anatomy, Surgery, Midwifery.

The Fees, whether Matriculated or Non-matriculated, for attendance on Lectures, shall be 1*l.* for each course of one term only, and 2*l.* for each course of more than one term, when attended for the first time, and 1*l.* for each re-attendance on the same; except that the fee for Anatomy and Physiology shall be 3*l.* when attended for the first time, and 2*l.* for every subsequent attendance; and that for Practical Anatomy or Practical Chemistry shall be 3*l.* for each attendance.

QUEEN'S COLLEGE, GALWAY.

FACULTY OF MEDICINE.

The College Session.—The College Session is divided into three Terms. The First Term commences October 17, and ends December 21, 1866. The Second Term commences January 5, and ends March 24, 1866.

Matriculation.—The Matriculation Examination is held at the commencement of the first Term; but additional Examinations are held before the close of the Term. The last Matriculation Examination is held on the 23rd of November. Each candidate before being admitted to Examination, must pay a fee of ten shillings, which will be returned to such as fail to pass.

Attendance on Lectures.—All Students shall pay the College Fee, and a moiety of their Class Fees, and enter their names with the Registrar, before they are admitted to the classes of the several Professors. No Student shall have his name replaced on the rolls at the second Term who has not paid the second moiety of his Class Fees. No Student shall be regarded as having kept a Course of Lectures who has not attended two-thirds of the entire number.

Examinations.—A Sessional Examination is held at the close of each Session in the subjects of Lectures. There is also a Supplementary Examination on the same subjects at the commencement of the following Session.

Scholarships.—Eight Junior Scholarships, of the value of 25*l.* each, are awarded to Students pursuing the Course for the Degree of M.D. The Examinations for Junior Scholarships are held at the commencement of the First Term. Junior Scholars are exempted from one moiety of the Class Fees. The College is empowered to award Exhibitions, varying in value from 10*l.* to 18*l.*, at the same Examinations as the Scholarships, and to be held upon the same terms.

Non-Matriculated Students.—Non-Matriculated Students are those who are permitted to attend Lectures without being required to pass the Matriculation Examination. They must pay the regulated Fees, and cannot compete for Scholarships or other distinctions. During attendance on College Lectures they may read in the Library; and, on payment of 1*l.*, may take out two volumes on loan. Non-Matriculated Students must pay one-half of their Class Fees before their names can be entered on the rolls, and the remainder at the commencement of the second Term.

Students of other Universities.—Any Student of a Queen's College or University, and any Medical Student who shall have pursued part of his Studies under recognized Teachers, on fulfilling such conditions as the Council prescribe, may take corresponding rank in this College; and may compete for Scholarships or other Prizes, provided.

Fees.—The College Fees for Matriculated Students are 10*s.*

for the first year, and 5*s.* for subsequent years. The Fees for all Students for attendance on Lectures are 1*l.* for each Course, of one Term, and 2*l.* for each Course of more than one Term, when attended for the first time, and 1*l.* for each re-attendance, except the following:—Anatomy and Physiology is 3*l.* for the first time, and 2*l.* subsequently. Practical Anatomy or Practical Chemistry is 3*l.* for each attendance. The Fees for Honour Courses are 2*l.* for each Course. This rule does not apply to special instruction in Practical Chemistry and in Operative Surgery. In the former case, the Fee is regulated by the time spent in the laboratory, at the rate of 1*l.* a month. The Fee for Operative Surgery is 3*l.* Fees are payable in two instalments. The first instalment includes the College Fee, and a moiety of the Class Fees payable at the commencement of the First Term. The second instalment—the remaining moiety of the Class Fees—at the commencement of the Second Term. Scholars are exempted from this latter moiety.

Residences.—Every Matriculated Student under the age of twenty-one, shall reside with his parent or guardian, or with some relation or friend, or in a Boarding-house, licensed by the President, where he shall be placed under the charge of the Dean of Residences of his creed.

MEDICAL SCHOOL, QUEEN'S COLLEGE, GALWAY.

The Hospitals in connexion with the College are in its immediate vicinity. They contain on an average two hundred patients, and are visited each morning by Professors of the College, who deliver Clinical Lectures.

The Pathological Department of the Medical Museum has received a large and valuable accession of preparations and drawings, the collection of a late eminent teacher. Instruction in Microscopic Anatomy is given in the Physiological Class-room.

PRIVATE TEACHERS IN CONNEXION WITH MEDICAL SCHOOLS OF DUBLIN.

Royal College of Surgeons.—Dr. Mapother, Physiology Mr. Croly, Surgery and Surgical Anatomy; Dr. Stoney, Anatomy; Dr. Macallister, Junior Anatomy—125 St. Stephen's green, West.

Dr. Arthur Mitchell, Chemistry, Pharmacy, Materia Medica, and Botany—118 St. Stephen's green, West.

Trinity College.—Dr. Bennett, 25 Holles street; Dr. A. W. Foote, 21 Lower Pembroke street.

Ledwich School.—Mr. Ledwich, Dr. Mason—7 Harcourt street.

Steeven's Hospital.—Anatomy, Physiology, and Surgery Dr. E. Hamilton, 128 Stephen's green.

Materia Medica, Pharmacy, and Chemistry—Dr. G. Symes Hume street.

Richmond Hospital.—Anatomy, Surgery, &c.—Dr. F. Curran, 71 Blessington street.

Materia Medica, Pharmacy.—Dr. Campbell, York street.

Catholic University.—Dr. Tyrrell, York street.

Fees.—The recognized fees for private instruction are as follows: for Surgical Licence or Diploma, £15 15*s.*; for Medical Degree or Licence, £5 5*s.*; for Army Medical Competitive Examination, £15 15*s.*; instruction in Materia Medica, Pharmacy, Chemistry, and Botany, £5 5*s.*

REGULATIONS OF LICENSING BODIES IN SCOTLAND.

UNIVERSITY OF EDINBURGH.

GRADUATION IN MEDICINE.

1. Three medical degrees are conferred by the University, viz., Bachelor of Medicine (M.B.), Master in Surgery (C.M.) and Doctor of Medicine (M.D.) The degree of Master in Surgery is not conferred on any person who does not also at the same time obtain the degree of Bachelor of Medicine.

2. The preliminary branches of education are English, Latin, Arithmetic, the Elements of Mathematics, and the Elements of Mechanics; and proficiency is ascertained by examination prior to medical study.

3. No candidate is admitted to a professional examination who has not passed an examination on two of the following in addition to the above:—Greek, French, German, High Mathematics, Natural Philosophy, Logic, Moral Philosophy and the examination on these takes place before the candidate has entered on his medical curriculum.

4. A degree in Arts in a University, exempts from all preliminary examination.

No one is admitted to the Bachelor of Medicine or Master in Surgery who has not been engaged in medical and surgical study for four years.

Every candidate for the M.B. and C.M. must produce certificates—1. That he has studied each of the following—Anatomy, Chemistry, Materia Medica, Institutes of Medicine or Physiology, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Children, and General Pathology, each 100 lectures; Practical Anatomy, six months; Practical Chemistry, three months; Practical Midwifery, three months; Clinical Medicine and Clinical Surgery, each six months; Medical Jurisprudence, Botany, Natural History (including Zoology), fifty lectures. 2. Two years practice of a general hospital. 3. Three months apprenticeship in compounding and dispensing drugs. 4. Six months out-practice of an hospital, or of a dispensary, physician, surgeon, or member of the London or Dublin Society of Apothecaries.

The studies for the degrees of Bachelor of Medicine and Master in Surgery are subject to the following regulations:—1. One of the four years of medical and surgical study must be in the University of Edinburgh. 2. Another must be in the University of Edinburgh, or in some other University entitled to give the degree of Doctor of Medicine. 3. The winter months at a general hospital, and, during the same period, a course of Practical Anatomy, may be reckoned as one of such four years. 4. One year's lectures in the hospital schools of London, or the College of Surgeons in Dublin, or of the teachers of medicine in Edinburgh, or elsewhere, recognised by the University Court, may be reckoned as one of the four years. 5. Candidates, not students of the University, attending the lectures of extra-academical teachers in Edinburgh must, at the commencement of each year, enrol their names in a book, to be kept for that purpose.

3. Every candidate must deliver, before the 31st March:—A declaration, in his own handwriting, that he has completed his twenty-first year, and that he will not be, on the day of graduation under apprenticeship. 2. A statement of his studies, as well in Literature and Philosophy as in Medicine, accompanied with certificates. 3. A thesis composed by himself.

3. Each candidate is examined, both in writing and *visu*—1st, on Chemistry, Botany, and Natural History; 2ndly, on Anatomy, Institutes of Medicine, and Surgery; and, 3rdly, on Materia Medica, Pathology, Practice of Medicine, Clinical Medicine, Clinical Surgery, Midwifery, and Medical Jurisprudence.

10. Students are admitted to an examination on the first vision of these subjects at the end of their second year.

11. Students who have passed their examination on the first vision may be admitted to examination on the second division at the end of their third year.

12. The examination on the third division cannot take place until the candidate has completed his fourth *annus medicus*.

13. Candidates may be admitted to examination on the first two of these divisions at the end of their third year, or the three examinations at the end of their fourth year.

14. A candidate found unqualified cannot be again admitted to examination unless he has studied during another year two of the prescribed subjects.

15. After the candidate has satisfied the examiners, he will be summoned, on the 31st day of July, to defend his thesis; and finally, if the Senate think fit, he will be admitted on the 1st of August.

16. The degree of Doctor of Medicine may be conferred on any candidate who has obtained the degree of Bachelor of Medicine, and is of the age of twenty-four years, and has been engaged, subsequently to the degree of Bachelor of Medicine, for two years at an hospital, or in the Military or Naval Medical Service, or in medical and surgical practice: the Doctor of Medicine must be a graduate in Arts of a University, and shall have passed a satisfactory examination in Greek, and in Logic or Moral Philosophy, and in one at least of the following subjects—namely, French, German, Higher Mathematics, and Natural Philosophy.

17. Persons who began medical studies before 1861, are entitled to graduate under the system in force before or after that date.

N.B.—No candidate can appear for his final examination for M.B., or for M.D., who has not deposited his thesis with the Dean on the 31st of March. This statute will be rigidly enforced.

Candidates for Graduation who commenced before 1861.

Candidates who commenced studies by attendance on classes

before 1861, are entitled to appear for examination for the degree of Doctor of Medicine, after four years' study, on completing their twenty-first year, and without having taken the degree of Bachelor of Medicine. They are also exempted from the Preliminary Examinations, and only require to undergo an examination on Latin. They are also exempted from attendance on Practical Chemistry and Practical Midwifery, and require only three months of Clinical Surgery, and eighteen months of hospital attendance.

Preliminary Examination in Arts.

1. Examination on preliminary education will take place on English: Writing out a narrative, with strict attention to correct spelling, the proper selection of words, the form of the sentences, and punctuation. Latin: Fifth *Æneid* of Virgil, and an easy passage from a Latin prose author. Arithmetic: The common rules, including decimals. Elements of Mathematics: Euclid, books i., ii., and iii., and the rudiments of Algebra, including simple equations. A knowledge of Euclid alone will not be sufficient. Elements of Mechanics: Lardner's Mechanics.

2. At the same dates examinations will take place on at least two of the following subjects:—Greek: An easy passage from the first three books of the *Cyclopædia* of Xenophon. French: *Histoire de la Littérature Française*, par J. Demogeot; from chap. xxxvii. to the end. German: Goethe's *Ægmont* and Schiller's *Braut von Messina*. Higher Mathematics: Euclid, books i. to vi.; Algebra, Trigonometry, and Conic Sections. Natural Philosophy: Elements of Natural Philosophy by Golding Bird and Brooke. Logic: Part-Royal Logic, part i., chap. 6 and 7; part ii., chap. 3, 4, 15, and 16; part iii., chap. 1, 19, and 20. Moral Philosophy; Springs of Action, Duties, Ethical Theories, as, e.g., in Stewart's "Outlines," part ii.

3. A Doctor of Medicine must be a Graduate in Arts, or have passed a satisfactory examination on three of the subjects mentioned in No. 2. Two of these must be Greek and Logic, or Moral Philosophy; and the third may be either French, German, Higher Mathematics, Natural Philosophy.

Examinations of the same extent at other British Universities granting the M.D. will exempt from these Preliminary Examinations. Certificates of such examinations must be produced, with an official notice of the subjects.

Candidates who mean to appear at any of these examinations must inscribe their names ten days before the examination, in a book which is kept at the College. Those who claim to be under the old statutes must produce evidence of having attended classes before Feb. 4th, 1861.

Notices to Candidates for Degrees.—In provincial schools a candidate can make one *annus medicus* only, and this is constituted by attendance on a hospital, with a course of Practical Anatomy. In the schools of London, in the Extra-Academical School of Edinburgh, and in the College of Surgeons of Dublin, a candidate may make two *anni medici*—one by hospital attendance and Practical Anatomy, and the other by two six-months' courses, or one six-months' course and two three-months' courses. The classes at these schools only qualify to the extent of 4.

The Professional Examinations take place in April, June, and October.

The Examinations in Chemistry, Botany, and Natural History take place in April and October. Those in Anatomy, Physiology, and Surgery take place in April. Those in the other departments of medicine take place in June.

Candidates for examination in Chemistry, Botany, and Natural History, at the end of their second *annus medicus*, must produce certificates in these subjects.

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH.

The attention of medical students is particularly directed to the fact, that after September, 1865, by the regulations issued by the General Medical Council, every medical student must have passed the complete Examination in General Education before he can be placed on the Register of Medical Students established by the General Council; and that no one can be placed on the Medical Register of Practitioners in virtue of any qualification in Medicine or Surgery until a period of four years has elapsed from the date of his registration as a medical student.

Professional Education.

1. Candidates commencing after Oct. 1st, 1865, must have been engaged in study four years after the Examination in General Education, which shall include four winter sessions' or three winter and two summer at a medical school.

2. Also the following courses of lectures:—Anatomy, two courses,* six months each; Practical Anatomy, twelve months; Chemistry, six months; Practical or Analytical Chemistry, three months; *Materia Medica*, three months; Physiology, fifty lectures; Practice of Medicine, six months; Clinical Medicine, six months; (in addition to the above courses of Practice of Medicine and Clinical Medicine, one course of either, at the option of the student); Principles and Practice of Surgery, six months; Clinical Surgery, six months (in addition to the above courses of Surgery and Clinical Surgery, one course of either at the option of the student); Midwifery and Diseases of Women and Children, three months; Medical Jurisprudence, three months; Pathological Anatomy, three months (or attendance on post-mortem examinations at a hospital). Candidates must have attended six cases of labour, either in a maternity hospital, or a dispensary where midwifery cases are admitted, or in private practice; and must produce a certificate to that effect. Also three months Practical Pharmacy under an apothecary, or a member of the Pharmaceutical Society, or a chemist and druggist recognised by either college, or in a hospital or dispensary, or as assistant to a registered practitioner.

3. The candidate must have also attended, for twenty-four months, a public general hospital, and for six months a public dispensary, recognised by the college; or for six months as visiting assistant to a registered practitioner.

4. A certificate in Vaccination, signed by a registered practitioner, will be required.

5. The following order of study is recommended, though not enjoined:—

First year: Anatomy, Practical Anatomy, Chemistry, Practical or Analytical Chemistry, Botany (the last either in this or the second year), Hospital.

Second year: Anatomy, Practical Anatomy, Physiology, Surgery, *Materia Medica* (the last either in this or the third year), Hospital.

Third year: Practice of Medicine, Clinical Surgery, Practical Anatomy, Practical Pharmacy, Clinical Medicine, Pathological Anatomy, Hospital.

Fourth year: Surgery or Clinical Surgery,* Midwifery and the Diseases of Women and Children, Practice of Medicine or Clinical Medicine, Medical Jurisprudence, Practical Midwifery, Hospital.

Registration.

1. A book shall be kept for the registration of medical students. In it all Edinburgh students who desire to possess the diplomas of the Colleges must be registered.

2. No student beginning after September, 1865, can be registered who has not passed the Preliminary Examination in General Education of the Colleges, or one of the equivalent examinations.

3. The register shall be closed within fifteen days after the commencement of each session or term.

Preliminary Examination in General Education.

1. The subjects shall be as follows—namely, English; Grammar and Composition. Latin. Arithmetic: To Vulgar and Decimal Fractions, inclusive. Any two of the following, at the option of the candidate:—Algebra; Geometry—Euclid, books i., ii., and iii.; Natural Philosophy; Greek; French; German; Botany; and Zoology. Candidates are requested, on giving in their names for the examination, to mention which they have selected.

2. After September, 1865, all students must have passed the complete Examination in General Education, and be registered before they commence their professional studies.

3. Candidates who commenced prior to October, 1865, may pass the Preliminary Examination at any period previous to the first Professional Examination. Candidates who have not done so will be required to undergo that examination on the day before the first Professional Examination, and pay a fee of 1*l.*

4. Students who intend to undergo the Preliminary Examination shall give in their names, addresses, and places of birth, three days before examination, and pay a fee of 10*s.*, not to be returned in case of rejection.

THE DOUBLE DIPLOMAS OF THE ROYAL COLLEGES OF SURGEONS AND PHYSICIANS OF EDINBURGH AND THE FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

Examinations for the Double Qualification of Licentiate in Medicine and Licentiate in Surgery.

The Royal College of Physicians of Edinburgh, and the Royal College of Surgeons of Edinburgh, while they still continue to give their Diplomas separately, under separate Regu-

lations, have made arrangements by which, after one series of examinations, the student may obtain the Diplomas of both Colleges. The general principle of this Joint Examination is that it shall be conducted by a Board, in which each body represented, for examination in those branches which are common to both Medicine and Surgery; but that the College of Physicians shall take exclusive charge of the examination in Medicine, and the College of Surgeons of the examination in Surgery. The object of the joint examination is to give to students facilities for obtaining from two separate bodies, at less expense, a qualification in Medicine and a qualification in Surgery. Students passing that examination successfully will be enabled to register two qualifications under the Medical Act,—Licentiate of the Royal College of Physicians of Edinburgh, and Licentiate of the Royal College of Surgeons of Edinburgh. The arrangement for thus conferring a double qualification by the operation of the two Colleges is in conformity with Section XIX. of the Medical Act, and receives the special sanction of the General Council of Medical Education and Registration, at a Meeting held on the 7th August, 1859. The code of regulations is as follows.

Professional Examinations.

1. Candidates for the double qualification shall be subjected to two Professional Examinations.

2. The first shall embrace Anatomy, Physiology, and Chemistry, and shall take place not sooner than the end of the second winter session.

3. The first Professional Examinations will take place on Nov. 1st, 1866; Jan. 30th, April 10th, May 8th, July 1st, and 31st, and Oct. 30th, 1867, when the candidates shall assemble for the purpose of writing answers to the questions proposed. The oral examinations will be conducted on the days immediately succeeding.

4. Candidates for the first Professional Examination must apply on or before the Saturday preceding the examination, and produce certificates of all those courses of study which have reference to the subjects of that examination, and a certificate of having passed the Preliminary Examination.

5. 6*l.* must be paid for this examination, not later than 10 a.m. of the day preceding it, as part of the entire fee of 16*l.* for the two diplomas.

6. In the case of a candidate being unsuccessful, 4*l.* will be returned to him, the remaining 2*l.* being retained.

7. Candidates who have passed the first Professional Examination of any Licensing Board will be admissible to the second Examination on producing certificates of the whole course of study, and paying the fee of 16*l.* In conducting the examination, none of the subjects will be omitted. Unsuccessful candidates will receive back 14*l.*

8. The second examination shall embrace Medicine, Surgery and Surgical Anatomy, Midwifery, Pathological Anatomy, *Materia Medica* and Pharmacy, and Medical Jurisprudence, and shall not take place before the termination of the last year of study. These examinations will take place immediately after the conclusion of the first Professional Examinations.

9. Applications must be made not later than the Saturday previous.

10. Every candidate must produce—1st, Evidence of having attained the age of twenty-one; 2nd, The tickets and certificates of his classes; 3rd, The certificate of the first Professional Examination; and 4th, A tabular statement (in which a printed form will be furnished by the Inspector) exhibiting the full amount of his education. The tabular statement must be attested by his signature, and will be preserved as a record.

11. The fee for this examination (10*l.*) must be lodged not later than 10 a.m. of the day preceding.

12. Unsuccessful candidates at either examination shall be remitted to their studies for a period, not in any case longer than three months.

13. In case of a candidate being unsuccessful at the second examination, 8*l.* will be returned.

14. Dissections and Anatomical Specimens, articles of *Materia Medica*, Chemical Tests, the Microscope, Surgical Apparatus, and Pathological Specimens, will be employed during the examinations; and every candidate will be required to write prescriptions. The examination may also consist, in part, of the actual examination of persons labouring under disease.

15. Candidates may be admitted to a special examination on days other than those appointed above, on paying an extra fee of 5*l.*, which will not be returned.

16. No candidate shall be admissible who has been rejected by a Licensing Board within the three months. Communications to be addressed to Dr. Gairdner, Inspector and Treasurer of the Double Qualification, at 45 Northumberland street, Edinburgh.

UNIVERSITY OF ST. ANDREWS.

DEGREES IN MEDICINE.

1. The Degree of Doctor of Medicine may be conferred on any registered medical practitioner above the age of forty years who shall, on examination, satisfy the Medical Examiners of the sufficiency of his professional knowledge, but not to a greater number than ten in one year.

2. Every candidate for the Degree of Doctor of Medicine except he be Bachelor of Medicine, shall pay fifty guineas, inclusive of the stamp duty.

3. The degrees in Medicine granted by the University of St. Andrews are, Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.)

4. The preliminary branches of extra-professional education or the Bachelor of Medicine and Master in Surgery, shall be—English, Latin, Arithmetic, the Elements of Mathematics, and the Elements of Mechanics; and the proficiency of students shall be ascertained by examination prior to the commencement of study.

5. Every candidate must have passed an examination on two of the following subjects, in addition to the above:—Greek, French, German, Higher Mathematics, Natural Philosophy, Natural History, Logic, Moral Philosophy: the examination on these subjects shall take place before the medical curriculum.

6. A degree in Arts of any University shall exempt candidates from all preliminary examination.

7. No one shall be admitted to the Bachelor of Medicine or Master in Surgery who has not been engaged in medical and surgical study for four years—the *annus medicus*, being constituted by two courses of one hundred lectures each, or by one such course and two courses of fifty lectures each; but, in the case of the clinical courses, it shall be sufficient that the lectures be given at least twice a week.

8. Candidates for the Bachelor of Medicine and Master in Surgery must produce certificates similar to those required by the University of Edinburgh.

9. No one shall be received as a Bachelor of Medicine or Master in Surgery unless two of his four years shall have been in one of the following—viz., the University of St. Andrews; of Glasgow; of Aberdeen; of Edinburgh; of Oxford; of Cambridge; Trinity College, Dublin; Queen's College, Belfast; Cork; and Galway.

10. Subject to the 9th Section, the studies for Bachelors of Medicine and Masters in Surgery shall be the following—1. The remaining years of study, other than those provided for by the 9th Section, may be either in one of the Universities and Colleges above specified, or in the hospital schools of London, or the College of Surgeons in Dublin, or under private teachers recognized by University Court. 2. Six winter months at a general hospital, and during the same period, a course of Practical Anatomy, may be reckoned as one of such remaining years.

11. Bachelors of Medicine and Masters in Surgery shall lodge with the Senatus—A declaration, in his own handwriting that, he has completed his twenty-first year, and is not under articles of apprenticeship. A statement of his studies, in literature, philosophy and Medicine, with certificates. A dissertation, composed by himself.

12. Bachelors of Medicine and Masters in Surgery shall be examined, both in writing and orally—first, on Chemistry, Botany, Elementary Anatomy, and Materia Medica; secondly, on advanced Anatomy, Zoology with Comparative Anatomy, Physiology and Surgery; and thirdly, on Practice of Medicine, Clinical Medicine, Clinical Surgery, Midwifery, General Pathology, and Medical Jurisprudence.

13. Students who offer themselves for examination on the first division of these subjects at the end of their second year may be admitted.

14. Students who have passed on the first division may be admitted to examination on the second division at the end of their third year.

15. The examination of the third division shall not take place until the fourth year.

16. Candidates may be admitted to examination on the first two of these divisions at the end of their third year; or to the three at the end of their fourth year.

17. Rejected candidates shall not be admitted unless they

shall have completed another year of study, or such portion of another year as may be prescribed by the Examiners.

18. Masters in Surgery must at the same time obtain the degree of Bachelor of Medicine.

19. The Doctor of Medicine may be conferred on any Candidate who has obtained the degree of Bachelor of Medicine, and is of the age of twenty-four years, and has been engaged, subsequent to the Bachelor of Medicine, for two years at an hospital, or in the military or naval medical services, or in medical and surgical practice; provided that subject to the first section, the Doctor of Medicine shall not be conferred on any person unless he be a Graduate in Arts, or unless he shall within three years of his B.M. examination have passed an examination in Greek, and in Logic or Moral Philosophy, and in one at least of the following subjects—namely, French, German, Higher Mathematics, Natural Philosophy, and Natural History.

20. Except under section 1. the degree of Doctor shall only be conferred on Bachelors of Medicine.

21. There shall be paid for the degree of Bachelor five guineas for each of the three divisions, each such fee being payable when the candidate is examined in that division, and if the candidate desires to be admitted to the degree of Bachelor only, he shall not be required to pay any further fee to the fifteen guineas; but if he desires the degree of Master in Surgery he shall pay a further fee of five guineas; and every candidate for the Degree of Doctor, being a Bachelor of Medicine, shall pay, in addition to the fees paid by him for the degree of Bachelor of Medicine, a fee of five guineas, exclusive of stamp duties.

UNIVERSITY OF GLASGOW.

Three degrees in Medicine are granted by this University, viz.: Bachelor of Medicine, Master in Surgery, and Doctor of Medicine. The course of study and the examinations for the several degrees conferred are nearly the same as in the University of Edinburgh. A term for conferring medical and surgical degrees is held on the third Thursday in May. The preliminary examinations of medical students in branches of General Education take place in the last week of October, and in the second week of April. The regulations and the notices of the subjects of examination may be obtained by application to the Registrar of the University. The fees for the degrees are as follows:—For the degree of M.B. (for each of three examinations 5*l.* 5*s.*) 15*l.* 15*s.*; for that of C.M. (in addition to the fee for M.B.), 5*l.* 5*s.*; for the M.D. (in addition to the fee for M.B.), 5*l.* 5*s.*; and Government stamp for diploma, 10*l.* 3*s.*

UNIVERSITY OF ABERDEEN.

Anatomy—Prof. J. Struthers, M.D. Practical Anatomy and Demonstrations—Prof. J. Struthers, M.D. Chemistry—Prof. Brazier. Institutes of Medicine—Prof. G. Ogilvie, M.D. Practice of Medicine—Prof. Macrobain, M.D. Surgery—Prof. W. Pirrie. Midwifery and Diseases of Women and Children—Prof. R. Dyce, M.D. Zoology with Comparative Anatomy—Prof. J. Nicol. Medical Logic and Jurisprudence—Prof. F. Ogston, M.D.

SUMMER SESSION.

Botany—Prof. G. Dickie, M.D. Materia Medica—Prof. Harvey, M.D. Practical Anatomy and Demonstrations—Prof. J. Struthers, M.D.; and Demonstrator. Practical Chemistry—Prof. Brazier.

The curricula for the several degrees conferred are nearly the same as in the University of Edinburgh.

Professional Examinations will be held twice in each year—namely, in April and July, directly after the close of the winter and summer sessions.

Matriculation fee, including all dues, for the winter and summer sessions, 1*l.*; summer session alone, 10*s.* Hospital practice daily at the Royal Infirmary.

Candidates who commenced their medical studies before November 1861, are entitled to appear for examination for the degree of M.D. after four years' study, one of which must have been at the University of Aberdeen.

FACULTY OF PHYSICIANS AND SURGEONS GLASGOW

Preliminary Examination in General Education.

Preliminary Examinations in General Education are conducted by the Faculty, and Certificates granted which qualify or Registration as Medical Students, in accordance the Regula-

tions of the General Medical Students, in accordance with the Regulations of the General Medical Council. Candidates for the Diploma of the Faculty must produce a Certificate of having passed this or an equivalent examination before being admitted to the Professional Examination.

The Examination will embrace the following subjects:—
1. English, Composition and Writing to Dictation; 2. Latin; 3. Arithmetic, to Vulgar and Decimal Fractions, inclusive; 4 and 5. Any two of the following, at the option of the Candidate:—(1) Algebra. (2) Geometry, Euclid, Books I. II. III. (3) Natural Philosophy. (4) Greek. (5) French. (6) German. (7) Botany. (8) Zoology.

Professional Examinations.

The Professional Examination for the Diploma are two in number.

The First embraces Anatomy, Chemistry, and Physiology. Before being admitted to this Examination, the Student must have completed his Second Winter Session of Study, and must produce evidence of having given the required attendance on the First Five Branches of the Curriculum.

The Second embraces the whole remaining Subjects of Study and cannot be undergone before the full Period of Study. Candidates will receive a printed form, which must be filled up so as to show their whole Course of Study. This, together with the Certificate regarding Lectures and Hospital Attendance; also Certificates of having attained twenty-one years of age; of moral character; and of having passed the First Professional Examination, must be delivered to the Secretary at least one clear day before the day of Examination.

First Professional Examinations take place on the First Tuesday of February, April, June, August, October, and December.

Second Professional Examinations take place on the Second Tuesday of each month.

The Fee for the Diploma is 10*l.*, payable thus:—4*l.* to the Secretary on entering for the First Examination, and 6*l.* on entering for the Second Examination.

THE FELLOWSHIP.

The Faculty embraces in its Fellowship both Physicians and Surgeons; and Candidates for admission may apply in either capacity, according to their qualifications. The proposal of a Candidate requires to be made at an ordinary meeting by two Fellows; but no proposal is received till the Candidate has by letter intimated to the President the Medical or Surgical Qualification (as the case may be) on which he desires admission. The Fee to be paid by a Fellow is 50*l.*; from this sum a Licentiate of the Faculty shall be entitled to a deduction of whatever amount he may have paid for his Diploma. In case of a Non-resident, in consideration of his inability to participate in all the privileges of the Fellowship, the Fee is 25*l.*, subject to the condition that the full Fee shall be payable should he at any subsequent time come to reside within five miles of the Faculty Hall.

ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.

Regulations for the Licence.

These are the same as those for the Joint Examination by the Colleges of Physicians and Surgeons, with the following exceptions:—Anatomy, six months; Practical Anatomy, six months; Surgery, six months; Clinical Surgery, three months.

Candidates for the Licence of the College who already possess a qualification from a recognised licensing body, or who have passed the first Professional Examination before a qualifying body, will not be required to be re-examined in Anatomy, Physiology, and Chemistry, but will have to undergo examination only in Practice of Medicine and Pathology, Materia Medica, Midwifery, and Medical Jurisprudence.

OF THE MEMBERSHIP.

1. Any Licentiate of a College of Physicians, or Graduate of a British or Irish University, with whose knowledge of Medical and General Science the College may be satisfied, may be admitted a Member of the College, provided he shall have attained the age of twenty-four years.

2. Every motion for the election of a Member shall be made at a quarterly meeting of the Fellows by one of the Fellows present, and seconded by another; and this motion shall be determined by ballot at the next quarterly meeting—a majority of three-fourths being necessary to carry it in the affirmative.

3. Every Member on the Roll of Attendance, whose address has been communicated to the Clerk, shall be summoned to attend all meetings of the Fellows and Members.

OF THE FELLOWSHIP.

1. No one shall be elected a Fellow of the College until he

has been at least one year a Member thereof, and has attained the age of twenty-five years.

2. Every motion for the election of a Fellow shall be made at a quarterly meeting of Fellows by one of the Fellows present, and seconded by another; and this motion shall be determined by ballot at the next quarterly meeting of Fellows—a majority of three-fourths being necessary to carry it in the affirmative.

3. If an urgent reason satisfactory to the Council be assigned, a Candidate may be proposed at an extraordinary meeting of the Fellows summoned for the purpose, and his Election may be balloted for at an extraordinary meeting of the Fellows specially summoned for the purpose; provided that the holding of this special meeting be agreed to by a majority of five-fifths of the Fellows present at the meeting at which the Candidate was proposed; provided also that not less than one week intervenes between the two meetings, and that due notice of the intended ballot be given in the billets summoning the second meeting. The Candidate shall in this case pay to the Treasurer a sum of Ten Guineas in addition to the ordinary Fees.

4. Every Fellow resident within five miles from the General Post-Office of Edinburgh, shall, on his election, have his name placed on the Roll of Attendance, and shall pay the Annual Contribution, and be subject to all the Laws of the College regarding Fines. Fellows resident beyond five miles shall have the option of having their names on the Roll of Attendance or not; but if their names be on the Roll of Attendance, they shall pay the Annual Contribution, and be subject to Fines.

5. Any Fellow may petition that his name be taken off the Roll of Attendance, which petition shall be determined by ballot at next quarterly meetings.

6. Any Fellow whose name is not on the Roll of Attendance may have it inserted by giving notice to the Secretary, who shall report to the next quarterly meeting; after which, the Fellow shall be entitled to all the privileges of the Fellowship, and may take his seat at the first meeting of the College.

7. Any Fellow leaving Edinburgh for a length of time, and omitting to petition to have his name taken off the Roll of Attendance, or wishing the same to be continued on it during his absence, shall be charged with his Annual Contribution and Fines.

8. Fellows whose names are not on the Roll of Attendance shall not have the use of the Library and Reading-room, except in the cases specified in Laws 9 and 10.

9. Fellows whose names are not on the Roll of Attendance, on coming to reside in Edinburgh, or within five miles thereof, for a period not exceeding six months, may, with consent of the Council, be allowed the use of the Library and Reading-room.

10. Fellows not on the Roll of Attendance, who reside permanently in Edinburgh, or within five miles thereof, but are not engaged in practice, may, with the consent of the Council, be allowed the use of the Library and Reading-room on payment of the Annual Contribution.

OF THE FEES.

1. The Fee payable by a Licentiate is Ten Guineas.
2. The Fee to be paid by a Member shall be Thirty Guineas.
3. When a Licentiate shall be raised to the rank of Member, he shall pay Twenty Guineas.
4. When a Member shall be raised to the rank of Fellow, he shall pay Thirty Guineas, exclusive of Stamp-duty.
5. All Candidates for the license Fellowship or Membership must lodge their Fees, and the amount of Stamp-duty payable at the time to Government, with the Treasurer, previously to presenting their petitions.

THE ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

Regulations for the Licence.

These are the same as those for the Joint Examination, given below, by the Colleges of Physicians and Surgeons, with the following exceptions:—Botany is not required. A second course of Medicine is not required.

The first Professional Examination embraces Anatomy, Physiology, and Chemistry. The second Surgery and Surgical Anatomy; also Medicine, Midwifery, Materia Medica, and Medical Jurisprudence.

Registered medical practitioners, whose degree or licence in Medicine dates prior to October 1st, 1861, are exempt from the first Professional Examination.

The fee for the diploma is 10*l.*; for a certificate to an

Assistant-Surgeon of the Royal Navy of qualification to act as
 11 Surgeon, *5l. 5s.*

ABSTRACT OF THE LAWS OF THE ROYAL COLLEGE
 OF SURGEONS OF EDINBURGH, IN REFERENCE
 TO THE FELLOWSHIP.

1. No person shall be received as a Candidate for the Fellowship who is not in possession of the Diploma of the Royal College of Surgeons of Edinburgh, or of the Royal College of Surgeons of England, or of the Royal College of Surgeons of Ireland, or of the Faculty of Physicians and Surgeons of Glasgow.
2. No person shall be admitted as a Fellow who is under twenty-five years of age.
3. Every Candidate for the Fellowship (with the exception of those entitled to enter under the old constitution of the college, and with right to its Widows' Fund), shall lodge with the President a Petition for admission, and shall be recommended by two Fellows as proposer and seconder, of whom one at least shall be resident in Edinburgh.
4. Candidates for the Fellowship (not embraced under the exception to Law 3), shall pay 25*l.* to the College Funds, including all Fees. The money shall be payable to the Treasurer immediately after the presentation of the Petition to the college.
5. The billets calling the meeting at which the petition is to be presented, shall intimate the name and surgical qualification of the Candidate, his professional appointments, if any, and the names of his proposer and seconder.
6. The petition shall be considered at a subsequent meeting, to be held not earlier than a month after the first; and, in the meantime, the petition, with the names of the proposer and seconder, shall be hung up in the library; and the billets calling the second meeting shall contain an intimation in the same form as those of the first.
7. At the meeting for considering the petition of the Candidate, the votes shall be given by ballot. Three-fourths of the votes are required to entitle the Candidate to be admitted; and the number of those voting shall not be less than twenty.
8. The Candidate shall be informed of the result of the ballot; but before taking his seat as a Fellow, he shall make a declaration to the following effect, and shall subscribe the same in the Sederunt-book:—"I hereby promise faithfully to maintain and defend all the rights, liberties, and privileges of the Royal College of Surgeons of Edinburgh, and to promote the interest thereof to the utmost of my power. I also promise faithfully to obey all the laws of the said Royal College, made and to be made."
9. Candidates who do not find it convenient to repair to Edinburgh may be permitted, by a vote of the College, to be enrolled as Fellows in absence, if they transmit letters of obligation to conform to No. 8 before taking their seats.
10. Every Fellow, on his admission, shall receive a Diploma with the seal of the College appended.
11. Every Fellow is entitled to attend the meetings of the College, and to take part in the proceedings and in the election of Office-bearers.
12. No Fellow of the College shall keep an open shop for the sale of drugs or other merchandise.
13. No Fellow of the College shall allow his name to be connected with advertisements or publications of an indelicate or immoral nature.
14. No Fellow of the College shall practise, or profess to practise, by the use of or according to any secret remedy or method of treatment; or shall allow his name to be connected with advertisements for the sale of any secret remedy, or for practice by the use of any secret remedy or method of treatment; or shall connect himself in partnership or otherwise, or continue in connexion with, any person practising by means of, or advertising, the sale of any secret remedy.
15. No Fellow shall be guilty of any deception or other immorality in the practice of his profession, or shall in any other way conduct himself inconsistently with the honour and decorum which become his position as a Fellow of the College.

Practice and Clinical Lectures in Royal Infirmary. SUMMER SESSION. Botany: Mr. Hennedy. Midwifery: Dr. Wilson. Medical Jurisprudence: Dr. Leisham. Surgical Anatomy, Practical Anatomy, and Osteology for Beginners: Dr. George Buchanan. Practical Medical Chemistry: Dr. Penny. Operative Surgery: Dr. G. H. B. Macleod. Hospital Practice and Clinical Lectures in Royal Infirmary. (See Advertisement.)

HOSPITALS AND SCHOOLS OF MEDICINE.

ST. BARTHOLOMEW'S HOSPITAL.

West Smithfield. E.C.

This hospital receives within its walls upwards of 6,000 in-patients annually, and its out-patients and casualties amount to more than 100,000 annually. It contains 650 beds, of which 403 are allotted to surgical, including ophthalmic, orthopædic, aural, and syphilitic cases, and 247 to medical cases and diseases of women and children. One of the assistant-physicians sees the medical out-patients daily, between eleven and two; and one of the assistant-surgeons sees the surgical patients daily, between twelve and two. The casualty patients are seen at all hours in the surgery by the apothecary, house-surgeons, and dressers. Surgical operations on Saturday, at half-past one. The physicians and surgeons deliver clinical lectures weekly, during both the winter and the summer sessions. A record of all important cases is kept, under the superintendence of the Registrars. Inspections of morbid anatomy, in the pathological theatre, as opportunities offer—of the medical cases, by Dr. Andrew; of the surgical cases by the house-surgeons, under the superintendence of the surgeons.

For hours of lectures, fees, &c., and further information, see Daily Class List and Advertisement.

CHARING CROSS HOSPITAL.

The Matriculation fee for Students is 2*l.* 2*s.* Those who enter to separate Courses of Lectures or to Hospital Practice only do not pay the Matriculation Fee. Matriculated students have the privilege of attending the course of Practical Demonstrations on Healthy and Diseased Structures given by Dr. Salter in the summer, and the practice of the Royal Westminster Ophthalmic Hospital. The fees amounting to 72*l.* 9*s.* may be paid in one sum, or by instalments, one at the commencement of the Winter session, the second on the return to study after the Christmas vacation.—(For further particulars, see advertisement.)

ST. GEORGE'S HOSPITAL.

Fees.—On payment of 100*l.* a Pupil becomes *perpetual* to the practice of the Physicians and Surgeons, and to the Lectures; and is entitled to compete for all Prizes and Exhibitions, as well as for the office of House Surgeon, and may hold a Dressership for two periods of three months.

On payment of 80*l.* for first two years, and 10*l.* a year after, a Pupil is admitted to the Hospital Practice and Lectures required by the various examining bodies.

The following Prizes will be awarded to the most distinguished, viz.:

In the First Year, Ten Guineas, for proficiency in Anatomy, Physiology, Chemistry, and Botany. In the Second Year, Ten Guineas, for proficiency in Anatomy, Physiology, Chemistry, and *Materia Medica*. In the Third Year, Ten Guineas, for proficiency in the Principles and Practice of Medicine and Surgery, Pathology, and Midwifery.

The Obstetric Assistant, who resides and boards in the Hospital, with a yearly Salary of 100*l.*, is appointed annually by the Weekly Board from among the Pupils who are qualified to practice.

The Curator of the Pathological Museum, and the Medical and Surgical Registrars of the Hospital, with Salaries of 50*l.* and 20*l.* per annum respectively, are appointed annually by the Weekly Board from among the Senior Pupils.

The House-Surgeons are selected half-yearly from the most advanced and most distinguished of the Perpetual Pupils.

The Hospital contains 350 beds. A Ward is devoted to diseases peculiar to women, under the charge of the Obstetric Physician.

Certificates of attendance in the Wards will not be signed unless the Pupil has held a Clerkship to the Physicians and Surgeons respectively, as well as a Dressership, for periods of not less than three months each.

For Hours of Lecture, Fees, &c., see Daily Class List.]

SCHOOLS OF MEDICINE IN SCOTLAND.

ANDERSON'S UNIVERSITY, George street, Glasgow. Chemistry: Dr. Penny. Practical Chemistry: Dr. Penny. Surgery: Dr. G. H. B. Macleod. Institutes of Medicine, Physiology: Dr. F. Watson. Anatomy, Anatomical Demonstrations, and Practical Anatomy: Dr. George Buchanan. Practice of Medicine: Dr. Cowan. *Materia Medica*: Dr. Morton. Hospital

GUY'S HOSPITAL.

Lying-in Charity.—Number of cases attended annually, about 2,000.

26 Beds for Diseases of Women; 30 Beds for Ophthalmic cases.

Museums of Anatomy, Pathology, and Comparative Anatomy, contains 10,000 Specimens, 4,000 Drawings and Diagrams, an unique collection of Anatomical Models, and a series of 400 Models of Skin Diseases.

Fees.—Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay 40*l.* for the first year, 40*l.* for the second year, and 10*l.* for every succeeding year of attendance, or 100*l.* in one payment entitles a student to a perpetual ticket.

A Resident House-Surgeon is appointed every four months from those Students who have obtained the College diploma.

Six Scholarships, varying in value from 25*l.* to 40*l.* each, will be awarded at the close of each Summer Session for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine, and one for Surgery.

A Voluntary Examination will take place at entrance, in Elementary Classics and Mathematics. The three first candidates will receive respectively 25*l.*, 20*l.*, 15*l.*

For Hours of Lecture, &c., see Daily Class List and Advertisement.

KING'S COLLEGE.

The physicians' assistants, the physician-accoucheur's assist. the clinical clerks, and the house surgeon and dressers, are selected from among those matriculated students of the College who are pupils of the hospital. The matriculation fees amount to 5*l.* 15*s.* 6*d.* and must be paid on entrance. Registration fee at hospital, 10*s.* 6*d.* Scholarships.—Warneford Scholarships: Two of 25*l.* per annum, for three years; three of 25*l.* per annum, for two years. College Scholarships: One of 40*l.* per annum, for two years; one of 30*l.* for one year; three of 20*l.* for one year. The Daniell Scholarship, of the annual value of 20*l.* Prizes.—Two Medical Clinical Prizes, one of 3*l.* for the Winter Session, and the other of 2*l.* for the Summer Session; and two Surgical Clinical Prizes, of the same value. A prize of 3*l.* in each class, summer and winter.—(For further particulars see advertisement.)

LONDON HOSPITAL.

Whitechapel, E.

Consulting-Surgeon—Mr. Luke.

Physicians—Drs. P. Fraser, H. Davies and Parker.

Assistant-Physicians—Drs. A. Clark, Ramskill, Down, and J. H. Jackson.

Surgeons—Messrs. Adams, Curling and Hutchinson.

Assistant-Surgeons—Messrs. Maunder, Couper, Little, and Rivington.

Obstetric Physician—Dr. Head.

Surgeon-Dentist—Mr. Barrett.

The London Hospital contains 445 beds, of which 135 are allotted to medical, and 310 to surgical cases. Of these 310 beds about 190 are exclusively appropriated to cases of accident. In the year 1862, the Hospital received 31,775 patients, including 4,164 in-patients, and 27,611 out-patients. The accidents brought to the hospital during 1862 were, 12,488, including 2,180 in-patients, and 10,308 out-patients. Wards are especially appropriated to cases of uterine disease and to a limited number of cases of syphilis.

Maternity Department—451 poor women were delivered at their own residences during the past year.

Two gold medals are annually awarded to students attending the medical and surgical practice who shall have most distinguished themselves. Clinical lectures are given by the physicians and surgeons, by the assistant-physicians and assistant-surgeons, and by the obstetric physician.

Two Scholarships will be awarded to first-year's students during the ensuing winter session. The first, value 20*l.*, for the best examination on the Bones, at Christmas, 1865; the second, value 25*l.*, in March, 1866, for the best examination in Anatomy, Physiology and Chemistry.

Special instruction in Operative Surgery, in accordance with the Army, Navy, and India Board Regulations, under the superintendence of Mr. C. F. Maunder, assistant-surgeon to the Hospital. A cabinet of Materia Medica is open to students.—(For further particulars, see Daily Class List and advertisement.)

ST. MARY'S HOSPITAL.

For lectures, fees, &c., to this Hospital, see Tabular List.

THE MIDDLESEX HOSPITAL.

The Hospital contains upwards of 300 Beds, of which 185 are for Surgical and 120 for Medical cases.

ST. THOMAS'S HOSPITAL.

Prizes.—For First Year's Students: the College Prize of 30*l.*; a Prize of 20*l.* A Prize of 10*l.* for Second Year's Students. A Prizes of 30*l.*, 20*l.*, and 10*l.*, with the Dressers and the Clinical Clerks, to Third Year's Students. A Prize of 30*l.*, 20*l.*, and 10*l.* The William Tite Scholarship, founded by William Tite, Esq., M.P., F.R.S., the proceeds of 1,000*l.* Consols, tenable for three years, is awarded every third year. Clinical clerks and dressers are selected according to merit. Certificates of honour are given. The dressers are provided with rooms and commons free of expense. The Grainger Testimonial Prize of 20*l.*, awarded biennially to third or fourth year's students, for the best Physiological Essay, to be illustrated by preparations and dissections. The Cheselden Medal, for Surgery and Surgical Anatomy. The Treasurer's Gold Medal, for general proficiency and good conduct. A Newman Smith Prize, to the value of 40*l.*, will be awarded in December, 1866, for the best essay on "The Anatomy of the Brain and Spinal Cord, &c." The house-surgeons and resident accoucheur are chosen according to merit, with rooms and commons. Two hospital registrars at 40*l.* per annum each, or one at 80*l.*, will be selected from gentlemen distinguished for merit.

Fee to hospital practice and lectures for the first and second year, each 40*l.*; and 10*l.* for each succeeding year; or 90*l.* perpetual.—(For further particulars, see Tabular List and advertisement, s.)

UNIVERSITY COLLEGE, LONDON.

Physicians—Dr. Jenner, Dr. Hare, Dr. Reynolds.

Obstetric Physician—Dr. Hewitt.

Assistant-Physicians—Dr. Harley, Dr. Wilson Fox, and Dr. Ringer.

Surgeons—Mr. Quain, F.R.S., Mr. Erichsen, Mr. Marshall, F.R.S., and Mr. Henry Thompson.

Consulting Surgeon to the Eye Infirmary—Mr. Quain, F.R.S.

Medical Clinical Lectures by Dr. Jenner, Dr. Hare, and Dr. Murphy; also by Dr. Reynolds, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease, and who gives a series of lessons and examinations on the physical phenomena and diagnosis of disease to classes consisting of a limited number, and meeting at separate hours.

Prizes.—Gold and Silver Medals for excellence in the examinations at the close of the courses in most of the classes.

Liston Gold Medal for Clinical Surgery.

Dr. Fellowes' Medals for Clinical Medicine, two gold and two silver.

Filliter Exhibition for proficiency in Pathological Anatomy, 30*l.*

Longridge Exhibition [for general proficiency in Medicine and Surgery, 40*l.*

An Atkinson Morley Scholarship for the promotion of the study of Surgery, 45*l.* per annum, tenable for three years.

Entrance Exhibitions.—Three Entrance Exhibitions of the respective value of 30*l.*, 20*l.*, and 10*l.* per annum, tenable for two years, will be awarded, upon examination, to gentlemen who are about to commence their first winter's attendance in a Medical School.

The Examination, by written papers, will be in Classics, Elementary Mathematics, Natural Philosophy, and in either French or German, at the option of the candidate, and will take place at the College on Tuesday and Wednesday, the 3rd and 4th of October.

For Hours of Lecture, &c., see Daily Class List and advertisement.

WESTMINSTER HOSPITAL.

Prize Appointments.—The offices of house-physician and house-surgeon are open to competition. No fee required, and board and lodging provided in the hospital free of expense. The assistant house surgeon is also appointed without fee, and is provided with commons free, as well as the Clinical clerkships and daesserships.—(For further particulars, see Daily List and advertisements.)

NOTICES TO CORRESPONDENTS.

Those Gentlemen who have so kindly forwarded us information and corrections, will please receive our best thanks. Several Original Papers, Correspondence, Hospital Reports, Notices of Books, and other matter, must unavoidably stand over to our next number.

CASES OF SOFTENING OF THE BRAIN.

By JOHN W. OGLE, M.D.,

PHYSICIAN TO, AND LECTURER ON MEDICAL PATHOLOGY AT, ST. GEORGE'S HOSPITAL, ETC.

The following cases, almost entirely from our Hospital Records, are intended as a supplementary continuation of the series which I furnished to the *Medical Times and Gazette* in 1864.* To each case I have prefixed a general descriptive heading which thus constitutes a rough analysis of the case, but I propose at the conclusion of the series to furnish a digest or synoptical analysis of the whole.

Case 61.—SOFTENING OF THE ARTERIES AND MIDDLE LOBE OF THE RIGHT CEREBRAL HEMISPHERE—STRUMOUS ULCERATION OF THE SKULL—FACIAL PARALYSIS—PECULIAR CARTILAGINIFORM DEPOSIT IN THE RIGHT CEREBRAL HEMISPHERE.

John A., aged 14, was admitted into St. George's Hospital, November 14th, 1838, with strumous disease of the hip-joint, followed by abscess and hectic fever. In June, 1839, great pain at the right side of the head came on, and toward the end of the month he grew dull and half stupid, and paralysis of the muscles of the *left* side of the face succeeded. He died August 7th.

Post-mortem examination.—*Cranium.*—Extensive strumous ulceration of the frontal bone existed, and there was much scrofulous deposit between the dura mater and frontal and temporal bones. The anterior and middle lobes of the *right* cerebral hemisphere were much inflamed, and the texture of the cerebral substance, from the cineritious matter above down to the basis, was much softened. Towards the level of the corpus callosum the brain-substance was yellow and half-diffuent, and this appearance increased towards the base, where the softening was greatest. About the centre of the right cerebral hemisphere an irregularly-shaped oblong portion of semi-cartilage, an inch and half by a third of an inch in size, was formed. It was firm and solid and contained many blood-vessels. The disease of the hip-joint had led to soft ankylosis between the femur and ilium.†

Case 62.—SOFTENING OF THE PONS VAROLII—PLUGGING-UP OF THE BRANCHES OF THE BASILAR ARTERY BY FIBRINOUS COAGULUM—ENLARGED INTRA-CRANIAL ARTERIES—HEPATIZATION—GANGRENE OF LUNGS.

F. W., aged 44, having just returned from India, where he had been insane, and suffered much with headaches, on account of an impaired constitution, was admitted into Fort P. H., under the care of Dr. Davy, May 23, 1839, in a comatose state, with eyes half closed, mouth drawn to the left, tongue black, breathing slightly stertorous, cold feet, and a pulse of 64. The pupils acted to light. On the following day the pulse was 84, and the feet were warmer, but deglutition was almost impracticable, and the urine passed involuntarily. The pulse subsequently became intermittent, the respiration slow, and the fæces passed involuntarily. He died comatose on the 27th.

Post-mortem examination.—*Cranium.*—Vessels of brain injected. Arachnoid partially opaque, with much fluid

beneath it; much fluid also in the lateral ventricles. On the *left* side of the pons varolii, close to the origin of the fifth nerve, was a small amount of recent lymph, and correspondently in the substance of the pons was a small cavity with irregular softened walls. Two small arterial branches from the basilar artery, close to the disorganized spot, were enlarged to about twice their natural size, and obstructed by dark coagulated blood. The vertebral and carotid arteries were large and thickened. *Thorax.*—Lungs hepatized at the lower portions, and in one part becoming gangrenous. *Abdomen.*—Organs natural, urine in bladder containing a few pus-like globules, and increased amount of urea, and many "fine filaments, not unlike the entozoa of cartilaginous fishes."

Case 63.—SOFTENING OF THE CENTRAL WHITE PARTS OF THE BRAIN—DISEASE OF THE KIDNEYS—APOPLEXY.

Esther A., aged 45, was admitted May 19th, 1841, with albuminuria. She died June 16th, having had marked symptoms of apoplexy with stertorous breathing, &c.

Post-mortem examination.—*Cranium.* The cerebral membranes were natural; the convolutions flattened, but the cavities of the ventricles not larger nor containing more fluid than natural. The fornix and the corpus callosum were softened; otherwise nothing was found in the brain. *Thorax.*—One of the lungs was very gorged and heavy. *Abdomen.*—The kidneys were granular, atrophied, &c. (113.)

Case 64.—SOFTENING OF THE WALLS OF THE CEREBRAL VENTRICLES—BREAKING DOWN OF THE SEPTUM LUCIDUM—HEADACHE AND COMA BEFORE DEATH—ILLNESS FOLLOWING RHEUMATIC FEVER.

Emma S., aged 18, was admitted July 7th, 1841. She had been attacked with acute rheumatism in the April previously, during which she had no affection of the chest, and went on improving until the latter end of the first week in June, when she was suddenly seized with violent pain in the head and giddiness, which had continued until admission, only intermitting at night. She would scream violently several times a day. On the 2nd of July stupor came on, but she could answer questions rationally. On the 4th she became speechless, and four days later she passed her alvine evacuations unconsciously, but could retain the urine. There did not appear to be any loss of power in the limbs. The catamenia had never appeared. The pupils were dilated, but sensible to the action of light. In spite of cold lotions to the head, aperients, combined with irritation to the neck, &c, she died in a comatose state, three days after admission.

Post-mortem examination.—*Thorax and Abdomen.*—Excepting one small spot in the jejunum, the various organs were natural. *Cranium.*—The arteries of the dura mater were much injected, and the veins congested. The dura mater was adherent to the arachnoid membrane. The surface of the brain was dry and viscid, and the convolutions flattened. Much fluid existed in the ventricles. The septum-lucidum was quite broken down, the surface of the walls of the ventricles being also very much softened. Slight gelatiniform effusion existed beneath the arachnoid at the base of the brain. (123.)

Case 65.—SOFTENING OF THE SURFACE OF THE RIGHT HEMISPHERE OF THE BRAIN—EPILEPSY.

James W., aged 49, was admitted January 13th, 1841, with epilepsy, and died January 14.

No further history has been recorded.

Post-mortem examination.—*Cranium.* The vessels of the pia mater were very injected, and adhesions existed between the opposed layers of the arachnoid membrane under

* Regarding enlargement and tendency to aneurism of intra-cranial and other arteries in connexion with plugging by fibrinous coagulum, see observations in the *Medical Times and Gazette* for February 24th. 1866.

* See number of that periodical for Dec. 31, 1864.

† See Hospital Path. Cat. 11, 5th, presented by Cæsar Hawkins, Esq.

the posterior surface of the right hemisphere of the brain; and the brain corresponding was much softened, to the size of a walnut, and broken down into a light greyish-brown substance. Slight fluid only in the cerebral ventricles. *Thorax*—The heart and other organs were healthy. The remaining viscera were not examined. (217.)

Case 66.—SOFTENING OF THE LEFT CEREBRAL HEMISPHERE—HEMIPLEGIA ON THE RIGHT SIDE—COMA BEFORE DEATH.

Sarah E., aged 45, was admitted August 24th, 1842, and soon passed into a speechless condition; the pupil of the left eye being contracted. The right arm and leg had lost all powers of movement, and she was unable to protrude the tongue. The pulse was 72, large and firm. It was stated that she had been in service until obliged to give up work two weeks previously, at which time the right arm became powerless, and she often asked if there was anything wrong with her mouth? She was cupped on the neck to sixteen ounces, and a purgative injection was given. Lumpy motions were brought away with the injection. Hiccough came on. She passed all her evacuations unconsciously. She was much the same the day following. She was now cupped on the temple, and hyd. c. creta was given thrice a day. On the 26th, she tried in vain to speak, and was very drowsy. Sordes appeared about the mouth. Ammonia was given, and she was blistered at the neck. Feverish symptoms with quick pulse and tenderness of the gums came on. She lay apparently asleep, not being roused by anything, until she died on the 29th. Before death the jaws became closed and the breathing laborious.

Post-mortem examination.—Thorax and Abdomen—Expecting hypertrophy of the left ventricle of the heart and atheromatous deposit in the aorta and carotid vessels, all the organs were natural. *Cranium*—The bones of the skull were natural. The right hemisphere of the brain appeared somewhat larger, and the left somewhat smaller than natural. The left hemisphere was much softer than it should be, especially toward the central parts, and more especially was this the case with the left corpus striatum, which broke up into shreds when subjected to the pressure of water. The softened parts were of a yellowish-colour, the difference between the grey and white parts being but slightly marked. The arteries of the brain were atheromatous. (35.)

SOFTENING OF THE POSTERIOR LOBE OF THE RIGHT CEREBRAL HEMISPHERE.

Case 67.—Henry P., aged 23, was admitted March 23rd, 1842, and died on the 27th.

Post-mortem examination.—Thorax and Abdomen—The lungs contained masses of extravasated blood, and the kidneys were mottled, having spots of extravasated blood in their substance. The surface of the bladder presented hæmorrhagic spots. *Cranium*—The cranial bones were natural. The arachnoid membrane was rather opaque in some places. The brain generally was of a natural consistency, but the medullary portion of the posterior lobe of the right cerebral hemisphere (to the extent in size of a walnut), immediately over the bend of the posterior cornu, was in a state of complete softening and of a greyish-yellow colour. The softened part had a well-defined limit, the surrounding brain-substance being rather firmer than usual and of a light-green colour. The softened part also contained minute extravasations of blood. The ventricles were natural, except that a few adhesions existed between their opposite walls.

Case 67.—SOFTENING OF CENTRAL WHITE PARTS OF THE BRAIN—DELIRIUM TREMENS—SUDDEN DEATH.

Gustavus C., aged 37, was admitted July 9th, 1844, in a state of delirium tremens, the second attack which he has had. Three days before admission, had had shivering and giddiness. Repeated doses of opium failed to produce

quiet for some hours, but at length he fell into a calm sleep, and in a quarter of an hour the nurse observed a greenish-looking fluid to flow from his mouth and nostrils, and, in seeming to awake for a moment, immediately afterwards he died (on the day of admission).

Post-mortem examination.—Thorax and abdomen. The lungs and kidneys were congested. *Cranium*. The vessels of the scalp and of the cerebral membranes were gorged, and the white parts of the brain were injected. The corpus callosum, fornix, and the ventricular surface of the optic thalami were much softer than the other parts of the brain. (148.)

Case 68.—EXTENSIVE SOFTENING OF SEVERAL PARTS OF THE BRAIN—PHTHISIS-PULMONALIS—COMA BEFORE DEATH.

John H., aged 36, an intemperate man, was admitted July 17, 1844. He had had cough and expectoration six months previously, and was re-admitted with pain in the head of a week's standing, for which he had had mercury freely given. The pulse was very weak. He was restless and delirious in the night, and two days afterwards passed the urine involuntarily. He became quite unconscious; strabismus and dilatation of the pupil of the right eye came on. The pulse rose, and ptosis of the left eyelid supervened. Varying somewhat as to consciousness, he went on pretty much the same until July 27th, when he died.

Post-mortem examination.—Cranium. A few old adhesions between the inner surface of the dura mater and the vicerarachnoid were found. The ventricles of the brain were much distended with fluid, and the walls of the ventricles were much softened to the depth of two lines. The fornix and septum-lucidum were quite destroyed. The medullary substance of the brain towards the lower part of the anterior lobe on both sides was much broken down, portions being of the consistency of thick cream. *Thorax and abdomen*—Scrofulous deposit existed in the lungs, and there were pleural adhesions. Other organs were natural. (162.)

Case 69.—SOFTENING OF THE WALLS OF THE CEREBRAL VENTRICLES AND CENTRAL WHITE PARTS OF THE BRAIN—EXTRAVASATION OF BLOOD INTO THE RIGHT LOBE OF THE CEREBELLUM—HEPATIZED LUNGS—DISEASED KIDENYS.

William E., aged 75, was admitted January 24th, 1845. He had been afflicted seven months previously with vertigo and weakness of the limbs, but not with any loss of consciousness. Since then he had had pain in the head, vertigo, and weakness in the legs, with a sensation of numbness, principally on the right side; at times the speech was impeded. For some months also he had had cough, and pain and tightness of the chest. Indications of pleurisy and pneumonia came on, and in spite of treatment he became worse. Delirium came on, and finally semi-coma, which continued until he died, July 6th.

Post-mortem examination.—Thorax and abdomen—There was marked hepatization of the lungs, and the heart was dilated and hypertrophied, and the kidneys contained cysts and also masses of patches of fibrine surrounded by dark red margins. *Cranium*—The sub-arachnoid fluid was slightly tinged of a reddish colour; the brain generally was pale. Increased fluid existed in the ventricles, the walls of which were soft and lacerable; the fornix and septum-lucidum being quite in a flocculent condition. The arteries at the base of the brain were very atheromatous, and in the right lobe of the cerebellum was a clot of blood of considerable size; the brain around being broken down and flocculent and of a saffron colour. (162.)

Case 71.—SOFTENING OF THE FORNIX AND SEPTUM-LUCIDUM—SCROFULOUS DEPOSIT IN THE LUNGS—GENERAL HYPERÆSTHESIA—PAINS DURING LIFE THOUGHT TO BE RHEUMATIC.

Thomas T., aged 12, was admitted February 18th, 1846.

He had for five weeks suffered from what were called rheumatic pains in the limbs, but not from any redness or swelling of the joints. From the beginning he had been thirsty and feverish. A few days before admission he became drowsy, and also had hæmoptysis. On admission, he was listless, screaming whenever any part of the body was touched. The tongue was dry and brown; pulse 108, small, but regular. The bowels not having been open for some time, an injection was given. In the evening he became delirious, moaning and screaming, and so remained through the night and next day. He gradually sank and died on the 20th.

Post-mortem examination.—*Thorax*—The lungs were very hepatized, and contained tubercular infiltration, as did the bronchial glands. In the heart, shreds of fibrine existed on the aortic mitral valve-flaps. *Abdomen*—Organs natural. *Cranium*—The cerebral convolutions were flattened, the membranes vascular, but quite transparent. The septum-lucidum and the fornix were so softened as to be quite broken up, and almost in a diffuent state. The brain was generally very much congested. (51.)

Case 72.—EXCESSIVE SOFTENING OF THE FORNIX—BONY PROJECTION FROM THE INTERIOR OF THE SKULL—TWITCHING AND PARTIAL LOSS OF MOTION IN THE LEGS.

Emma M., aged 25, was admitted June 27th, 1846; she had been ill about ten days with constant and severe headache and sickness, beginning with rigors, and the symptoms had continued ever since. Three days before admission, the pain had become worse, being only relieved for a time by leeching the temples, and afterwards by cupping. The bowels were opened by aperient medicine. On admission there was intolerance of light. The pupils were dilated, the right being much the larger and very sluggish. There was slight ptosis of the left upper eyelid. Vision was sometimes double or even treble. There was no paralysis, and no convulsions had existed. She said her memory was imperfect. There was no tympanitis; and no spots on the skin. She became delirious at night, and the headache became worse. The dilatation and ptosis increased, and she became unable to pass the urine. The headache continuing, twitching of the legs and partial loss of motion in them came on. Epistaxis and hæmoptysis followed. The twitching of the legs became more constant, and the tongue was protruded to the left side. She sank and died July 2nd.

Post-mortem examination.—*Thorax and abdomen*—The lungs contained several patches of extravasated blood; the spleen was pulpy, and the kidneys were very congested. *Cranium*—The bones of the skull were very heavy and devoid of diploë. On the left side of the superior longitudinal sinus, from the frontal bone was a small bony projection, flat and of the shape of a bean, to which the dura mater was attached. The convolutions of the brain were flattened, and the larger veins and sinuses on the surface congested. The lateral ventricles were dilated with clear fluid. The fornix was softened and creamy towards its posterior part, where it was broken up. The brain was congested, but otherwise natural. (149.)

Case 73.—EXTENSIVE SOFTENING OF THE RIGHT CEREBRAL HEMISPHERE—DISEASE OF THE HEART, LUNGS, AND KIDNEYS—CONVULSIONS BEFORE DEATH.

Matilda J., aged 45, was admitted September 16th, 1846, with well-marked symptoms of diseased heart and dilated bronchi. About four years previously she had had a fit, apparently of apoplectic character, and had never been well since. There was no apparent paralysis. The urine became albuminous. She became drowsy and forgetful, and had a fit of an epileptic character. She died October 21st.

Post-mortem examination.—*Thorax and abdomen.*—There was extensive disease of the heart, lungs, and kidneys. *Cranium*—Immediately above the fissure of Sylvius a portion of the anterior part of the right cerebral hemi-

sphere was softened to the extent of the size of a large walnut. This softened state extended downwards and outwards into the cortical part of the outer portion of the extremity of the fissure. It was doubtful, but the softened parts had the appearance of being the remains of an old apoplectic clot. (226.)

Case 74.—SOFTENING OF THE ENTIRE BRAIN—SCROFULOUS DEPOSITS IN VARIOUS PARTS OF THE BODY—VOMITING AND CONVULSIONS.

Thomas M., aged 2, was admitted January 27, 1847, with cough and diarrhœa of four months' standing. Symptoms of pulmonary phthisis had set in, and he went on until the day before death, when he was seized with vomiting and convulsions, which continued. He died, February 3rd.

Post-mortem examination.—*Thorax and abdomen*—Scrofulous deposits were found in the lungs, liver, kidneys, and spleen, &c. *Cranium*—The cerebral vessels were congested, and much serous fluid existed beneath the arachnoid. The ventricles were dilated, and their lining membrane was very vascular. The entire brain was in a softened condition. (39.)

Case 75.—SOFTENING OF THE CEREBELLUM—ARACHNITIS—DISEASE OF THE INTERNAL EAR—OPISTHOTONOS.

Mary W., aged 30, was admitted January 15, 1848. A needlewoman, who had lived in hot climates, from which she returned a year and a half ago, and ever since had had pain at the right side of the head, especially the right ear, accompanied by deafness. Fourteen days before admission she had acute pain of the head, especially at the right side, and opisthotonos with dysphagia came on. She was leeches and blistered at the nape of the neck, and mercury was given to salivation, but no good had followed. There had been no discharge from the ear. On admission, the face was anxious and flushed; the skin hot; the pulse 120, small and irritable; the tongue dry and brown; bowels open; catamenia regular; urine clear, high coloured; sor-des on the teeth; complete opisthotonos, and dysphagia and pain all over, especially of the right ear; almost total deafness, and loss of smell. No paralysis, or numbness of any part existed. The pupils were much but equally dilated, and acted to light, of which there was very great intolerance. Slight muscular twitchings existed in various parts of the body at times. The action of the heart was regular, and its sounds were normal. There was no evidence of disease in the thoracic or abdominal organs nor in the throat; the dysphagia apparently arising from the opisthotonos throwing the larynx forward, and fixing it. Ice was applied to the head, and aperients given, without effect. On the next day, ol. croton. gtt. j. and cal. gr. ij., were given and a blister applied. The bowels were well opened without beneficial result. On the 17th she had passed a restless night and was delirious, trying to get out of bed, and picking at the bedclothes, and there was great exhaustion and almost total dysphagia. The pupils were still dilated, and the intolerance of light continued. Pulse 108, weak and small. The hands were at times attacked by spasm. The opisthotonos persisted and the exhaustion increased until death, which occurred on the 18th.

Post-mortem examination.—The superficial vessels of the brain were congested, and much sub-arachnoid fluid existed. The cerebellum was firm, but very vascular. Very little fluid existed in the ventricles. Much purulent fluid and lymph existed in the sub-arachnoid tissues at the base of the brain, and passing down by the medulla and cord. The substance of the cerebellum was much softer than that of the cerebrum, but not actually broken down. On the right side, the dura mater was too easily separated from the temporal bone, and on its attached surface over the tympanum there was a small spot of lymph adherent giving it a thickened appearance, and correspondingly was an ulcerated opening in the petrous part of the temporal bone leading into the tympanum. This part of the petrous portion was inflamed and carious, and the mucous mem-

brane of the internal ear was destroyed, and the membrana ulcerated through. (21.)

Case 76.—PARTIAL SOFTENING OF THE FORNIX—PHTHISIS—SEMI-COMA AND DELIRIUM BEFORE DEATH.

Richard S., aged 55, was admitted December 13, 1848. He was a steady, sober man who had had a cough for three or four months: and for some days had had headache, vertigo, and no sleep, and had passed his evacuations in bed. His mind was pre-occupied, and he paid no attention to questions, saying, always, "he was very bad." The pulse was 84, and full; the skin warm; the tongue white; and there were physical signs of scrofulous consolidation of the lungs. He became delirious and violent. On the night of the 18th he was delirious, and asked for what he wanted, but he sank and died on the 19th.

Post-mortem examination.—Thorax and abdomen—There was scrofulous deposit in the lungs and mesentery, and the kidneys were congested. The lungs were also partly hepatised at their lower parts, and the pleural cavities obliterated. The heart was flaccid and pale. *Cranium*—The large vessels of the pia mater and of the ventricles were congested. The brain was "wet" and the ventricles distended with fluid. The margin of the fornix was at one part softened, but no exudation-corpules were found by the microscope. The septum-lucidum was perforated by a hole. (26.)

Case 77.—GENERAL SOFTENING OF THE BRAIN—DISEASED KIDNEYS—DELIRIUM AND COMA BEFORE DEATH.

H. C., aged 50, was admitted November 21st, 1849, with cough, orthopnea, blue lips, albuminous urine, ascites, and anasarca. She had had dyspnea for two years. Aperients and diuretics were given. A marked prolongation of the second sound of the heart appeared, which eventually became so complete as to have almost character of reduplication, and delirium and strangeness of manner came on, and the precordial dulness increased. Delirium and semi-coma preceded death, which occurred January 12th.

Post-mortem examination.—Thorax and abdomen—There was much disease of the kidneys and congestion of the liver and lungs, and the heart was pale and flabby, but no disease of its valves existed. *Cranium*—The cerebral membranes were much congested, and the ventricles distended with fluid. The brain throughout was softened and more vascular than usual. (13.)

Case 78.—GENERAL SOFTENING OF THE BRAIN—DISEASE OF THE BLADDER AND KIDNEYS, FOLLOWING LITHOTRITY—CONVULSIONS AND DELIRIUM.

William M., aged 40, was admitted December 13, 1849, and had the operation of lithotritry performed. Inflammation of the bladder and retention of urine followed. He had symptoms which were thought to be those of "a fit," and low delirium supervened. He died January 24th.

Post-mortem examination—The bladder and kidneys were greatly diseased. The thoracic organs not examined. *Cranium*—The brain throughout was softer than it ought to be and watery, having many "puncta vasculosa." The ventricles contained but little fluid. (21.)

A SELECTION OF CASES FROM THE
UNPUBLISHED MSS. OF F. McEVROY, M.D.,

BALBRIGGAN, COUNTY DUBLIN.

By EDWARD WM. ADRIEN, M.R.C.S., L.K.Q.C.P.I.

(Continued from page 250.)

A REMARKABLE CASE OF COMPOUND FRACTURE OF THE CRANIUM WITH DEPRESSION—DEATH RESULTING IN EIGHT DAYS AFTER THE ACCIDENT FROM CONVULSIONS.

Case 2.—In the early part of the year 1860, I was called to see M. F., aged about 25 years, whom, I was informed, had got a slight cut in the head about eight days previously, but did not complain of it until ten hours be-

fore I was sent for to see her. She was a remarkably strong and well made country girl, was a general servant in the house of a small farmer, where she used frequently to work in the fields, planting potatoes, &c.

On my arrival I found her working in strong convulsions, in fact, dying; convulsion after convulsion came on in rapid succession, partaking rather of the tonic spasms usually seen in cases of tetanus, and in less than half an hour after my arrival she died.

The history of the case, as far as I could learn from a girl who was with her when the accident occurred, and from the sworn testimony of witnesses at the inquest, was that one fine spring's evening she and the girl to whom I have alluded above were walking along the road adjacent to their homes, when some person, who has never since been discovered, threw a stone, or rather a lump of hard clay with a stone concealed in its centre, from behind the hedge, which struck the girl on the left side of the head. She fell and after a few minutes got up with the assistance of her friend; staggered about for a short time, after which she expressed herself nearly as well as usual and thought very little about what had occurred.

The most curious feature in the case was, that she walked home, milked four cows that very evening and twice a day up to the day of her death; assisted in churning two large churnfulls of cream, planted some potatoes, walked twice into Balbriggan and back, a distance of two English miles from her home, and did various other farm and household works for seven days.

Over the left parietal bone I could see a wound about an inch in length, with elevated and puffy edges, from which there was a thin ichorous discharge of a dusky greenish colour.

I inserted the top of my little finger into the depression, and found from the yielding nature of the bone beneath that the skull was fractured, and that a square piece of bone was driven in upon the brain.

On the post-mortem examination I found that a portion of the parietal bone, about an inch square, was fractured, and so loose as to be easily removed after the scalp was divided; between the scalp and the cranium there was a quantity of greenish-coloured lymph of rather a fetid odour. Underneath the fractured portion of bone the dura mater was detached to a considerable extent around the seat of fracture, and of a dark greenish colour, the portion of brain beneath which was also of a dusky hue and greatly softened. The remaining portion of the brain was apparently quite healthy.

Balbriggan, August 28th, 1866.

POPULATION OF TOWNS.—At the late meeting of the British Association, the Rev. A. W. Worthington read some remarks on the Disproportion between the Male and Female Population of some Manufacturing and other Towns, which in substance stated that the proportion of females to males on the whole population was 105 to 100; but where employment differed in different towns and districts, and as men or women found ready employment, one or the other predominated in number. In the mining district of which Newcastle was the centre, and that in which Sheffield stood, in Stafford, in the barrack towns of Canterbury, Winchester, and Colchester, men predominate; while in manufacturing districts like Manchester and others, and notably in Norwich, there is an excess of women. In Nottingham there was an extraordinary excess of women over men; and this was also the case in seaport towns like Plymouth and Bristol, and it was still more marked in Liverpool. It is supposed that female labour in manufacturing districts will increase rather than decrease, owing to its comparative cheapness; but it is attended by serious social and domestic evils, especially juvenile mortality. The rate of illegitimacy was also higher where there was an excess of women, and in Nottingham that rate reached 10 per cent. of all the births. It was suggested that the means of amendment of this state of things was to be found in the promotion of family life, and especially by having the wife and mother to attend to her domestic duties; and employers of labour were urged not to employ married women.

CRANIOTOMY.

By D. B. O'FLYNN, Carrignavar.

I PERCEIVE, in the last number of THE MEDICAL PRESS AND CIRCULAR, a paper from Dr. Griffith, in which he refers to some remarks of mine, which appeared in your number of the 8th ult., and as he takes exception to some of the principles laid down by me, it may be necessary to say something in reply.

Dr. Griffith is right in assuming that I did not use chloroform in the case alluded to, and my reasons were—first, because in a remote country district it was impossible to get proper professional assistance, without which I was not warranted in employing so dangerous an agent; and, secondly, because I do not attach so much importance to the use of chloroform in midwifery practice as Dr. Griffith seems to do, nor are the cases published by Dr. Griffith in your last impression calculated to alter my opinion on this subject.

It appears that the subject of the first case, when seen by Dr. Griffith, was in a state of insensibility, suffering from puerperal convulsions, and after the effects of the chloroform had passed away, she continued insensible up to the second day after delivery, when she died comatose. I presume Dr. Griffith is ready to prove that death in this case did not result from the use of chloroform; but why administer this drug to a person in a state of insensibility? As well may Dr. Griffith give opium to a woman in sound sleep. There are two opposite states of the cerebral vessels accompanying puerperal convulsions—viz., distension and emptiness; and as Dr. Griffith makes no mention of profuse hæmorrhage, but tells us that all the fatal signs pointed to cephalic mischief, we may conclude that the critical condition of his patient was caused by congestion of the brain, in which case chloroform was contraindicated, for though it may stop the convulsive spasms of the muscles, it was certainly calculated to aggravate the apoplectic state that produced them, and I must here observe that if Dr. Griffith had taken blood from the arm, or applied a few leeches to the temples, he may not have to record the premature death of a young wife in her first confinement.

In the case of Mrs. W., aged 45, Dr. Griffith was unable to turn, in consequence (as he says) of the projection of the sacral promontory, which made it impossible for a living child to pass, and eventually he had to break up the entire skull before the child could be drawn through the narrowed pelvis. Now, it must be remembered that Mrs. W. had ten or twelve children by her first husband, and as she had no trouble in any of her previous confinements, it would be interesting to know how her pelvis became so contracted and her sacrum so prominent during her widowhood that all the difficulty in this case should arise from those causes. I am well aware that malposition or ossification may render craniotomy necessary in a multipara whose former labours were all natural; but it is difficult to understand how a woman whose pelvis was so deformed as that described by Dr. Griffith, in which "the anterior convexity of the sacral angle was so greatly increased," could pass through twelve confinements without requiring professional assistance in some of them.

Whatever caused the difficulty in this case, I freely admit that Dr. Griffith was justified in doing the operation, and I have no doubt but that it was a case in which the mode of delivery suggested by me would have proved successful, and if adopted, would have saved Dr. Griffith the trouble of tearing away the parietal bones and breaking up the entire skull at the imminent risk of lacerating the soft parts of the mother.

One advantage claimed for chloroform by Dr. Griffith is, that while under its influence the woman will not be disheartened by the protracted efforts to relieve her; but as puerperal pain is not necessarily connected with diseased action, and leaves no bad effects after it has passed away, and as my experience teaches me that most women bear those operations with wonderful fortitude and resig-

nation, I do not see the necessity for using chloroform in instrumental labour unless some particular circumstance calls for it, such as dread of an operation or nervous excitement on the woman's part, or the inability of the operator to keep her in a proper position, and unless some such necessity arose, I would rather see her dispirited than comatose.

In making those remarks I by no means underrate the value of chloroform in certain cases. I believe it is particularly useful in rigidity of the os and perineum, in hysterical convulsions uncomplicated with head symptoms, and in difficult transverse presentations, when the membranes are ruptured and the uterus is tightly contracted around the child.

Dr. Griffith asks if I used my fingers to guide the perforator. I have to say that I did, and I will further add, that any man who would think of using a perforator without guiding it with his fingers should be deprived of his diploma. When the forceps is locked and held by an assistant, there can be no difficulty in introducing the hand between the blades and directing the perforator along the fingers, and I feel sure that if Dr. Griffith tries the mode of delivery suggested by me in his next craniotomy case, he will find it safer and easier than the method he has hitherto adopted, and he may perchance be forced to agree with Gooch, who calls the crochet a diabolical instrument, or with Mackenzie, who says it is mechanically unfit for guiding the descent of the head, so that its different diameters may be made to accord with those of the brim.

In conclusion, I have merely to add that, as Dr. Mackenzie says nothing about chloroform in his paper in vol. i. of the "Obstetrical Transactions," I am unable to inform Dr. Griffith whether he used it or not.

Carrignavar, Sept. 15, 1866.

THE RINDERPEST OF THE PRESENT TIME,
AND
THE CATTLE PLAGUES OF PAST AGES,
IN THESE ISLANDS,
AND ON
THE CONTINENT.

By THOMAS MORE MADDEN, M.D., M.R.I.A.,

LICENTIATE OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND; MEMBER OF THE ROYAL COLLEGE OF SURGEONS, ENGLAND; LICENTIATE OF THE FACULTY OF PHYSICIANS AND SURGEONS, GLASGOW; DEMONSTRATOR OF ANATOMY, CARMICHAEL SCHOOL OF MEDICINE; AUTHOR OF "CHANGE OF CLIMATE IN PURSUIT OF HEALTH," "THE CLIMATE OF MALAGA," "OBSERVATIONS ON INSANITY AND CRIMINAL RESPONSIBILITY," ETC., ETC.

PART III.

HISTORICAL NOTICE OF CATTLE PLAGUES IN IRELAND FROM THE EARLIEST AGES TO THE PRESENT TIME.

(Continued from page 274.)

From the thirteenth to the seventeenth century we find numerous brief allusions to cattle plagues in Ireland in the "Four Masters," the "Monasticon Hibernicum," "Chronicon Sectorum," "Ware's Annals" and other similar works—as, for instance, in the years 1285, 1302, 1321 to 1324, 1407, 1450, 1473, 1500, 1572, 1683; but most of these epizootics are described so vaguely that I need not repeat entries of which I have already given sufficient example. In the last century murrain and cattle plague seem to have been common in Ireland. I have had a good opportunity of observing the frequency of these diseases as recorded in the collection of early Irish newspapers in the possession of my father, Dr. R. R. Madden, which is, I believe, unrivalled. Among the Dublin newspapers of the eighteenth century which I have consulted for this purpose are *Reilly's Dublin News-Letter*, 1739; *Falkiner's Dublin Journal*, 1737; *Dublin Courant*, 1741; *Dublin Chronicle*, 1788; *Pue's Occurrences*, *Freeman's Journal*, *Evening Post*, and *Hibernian Journal*.

In 1745-46 there was a murrain in Ireland, the symp-

toms of which are thus described:—"A dry, husky cough, fœtid breath, shivering, diarrhœa; or, in some cases, obstinate constipation."

In December, 1748, the cattle plague seems to have been imported from England into Ireland. We read in the journals for that month, under the head of "Ireland":—"A distemper is got among the horned cattle in some parts of this kingdom which seizes them with a sudden swelling in their heads and necks, and often proves fatal; it is ascribed to the very warm season."

In September, 1749, the *Gentleman's Magazine* says:—"We hear from Belfast that they are very apprehensive of a murrain among the cattle, as there are several cows seized with the distemper called the 'big head,' and one dead of the same; and that some swine, by drinking up the blood, were instantly killed." (P. 428.)

I shall not here copy every record of disease amongst cattle in Ireland during the latter half of the eighteenth century, contained in the Dublin newspapers and periodicals of that period, most of which appear to have been the ordinary maladies of horned cattle, such as epidemic catarrh, and other similar affections. In 1802 influenza, which we learn from continental writers then prevailed among cattle in Central Germany, invaded this country, and early next year it began to attack mankind, and soon became a wide-spread, though seldom dangerous, epidemic in Ireland, whence it seems to have crossed back into England, disappearing in this country as soon as the warm weather set in. In 1803 dysentery was epidemic in Ireland, and a similar epizootic, known as the "bloody murrain," prevailed among cattle. From this time a period of comparative freedom from cattle plague seems to have elapsed. The next important epizootic is recorded in 1839, when, as we read in the early volumes of the DUBLIN MEDICAL PRESS, which commenced in that year, and in the fifth part of the Census Report for 1851, vol. i., after a hard wet winter the "epidemic atmospheric constitution," which from this year prevailed more or less in Ireland for some years, and which finally culminated in "the fever and famine years" of 1846-47 began to manifest itself in July, when the potatoe blight appeared, and in the same month an epizootic, not confined to horned cattle, prevailed in the north of Ireland. The following year was also extremely wet, and was two degrees under the average annual temperature. During these two years the potatoe and grain crops having failed extensively, famine and fever went, as usual in all similar epidemics, hand in hand together. Nor did the "epidemic constitution of the atmosphere" limit its influence to these, but the lower animals shared its ill effects. So that another proof was thus afforded of the extraordinary sympathy and connection which subsists between the vital conditions of all orders of organic life. In these years pleuropneumonia, which previously had been epidemic among cattle in England, and on the continent, was imported into Ireland, where it occasioned great loss of stock, and where though dormant, it has never since been extinct, and occasionally becomes epizootic.

It would be needless for me to pursue the history of the various outbreaks of pleuropneumonia in Ireland from 1839 to 1865, some of which presented symptoms very like those of the present cattle plague. The history of this disease, unfortunately, is but too familiar to the owners of stock in this country. Of its cause, this is not the place to treat, but this much I may say, that I perfectly agree with the opinion of one of the largest proprietors of cattle in the south of Ireland, who told me that he ascribed the frequency of the disease in late times to the so-called "improvements" in the breeds, and treatment of cattle in this country by which their appearance may be rendered better calculated to gain prizes for weight and size, while the constitution of the animal, like the hot house plant, is injured by the forcing and artificial system by which this result is attained.

For more than ten months after the rinderpest broke out in England, in June, 1865, Ireland remained unaffected

by the disease, which had begun to decline in England. And a hope was generally entertained that the precautions taken to exclude the importation of the contagion having apparently succeeded so long, this country, notwithstanding its continual communication with the sister island would escape the visitation. But on the 14th of May, 1866, Prof. Ferguson reported to the Irish government, that the rinderpest had broken out at Drennan in the county Down, within six miles of Belfast. The infected cattle were at once killed, a cordon was drawn round the district and other precautionary measures were adopted. I shall not here allude to the controversy which took place between the veterinary surgeons and the owners of stock, as to the disease observed in the country being rinderpest or pneumonia, as there can hardly be a doubt that the disease which carried off eight head of cattle at Drennan, before it was reported, and caused the destruction of seven afterwards, was the cattle plague or rinderpest which prevailed in England. It is not my purpose here to chronicle the various steps taken in consequence of the appearance of the rinderpest in Ireland, and the consternation it excited. Suffice it to say that the disease lurked on in Ireland after the panic had subsided, and when as was said by Professor Ferguson, in his official report on the 30th of May, 1866:—"It is very probable that the report founded on Dr. Mapother's experience of the disease in England as well as in Ireland, is quite conclusive as to the identity of the malady with rinderpest. Dr. Mapother's opinion has corroborated every expert who examined the infected cattle or their viscera after death;" and acting on it the Irish Government the following day, passed an Order in Council, prohibiting the export of cattle from Ireland.

Numerous cases of alleged rinderpest were reported during the months of May and the early part of June, in various parts of the country, but the official inspectors reported that after examination, they were found to be cases of ordinary cattle diseases aggravated by the long continuance of east winds this spring, and most of them were pronounced either pleuropneumonia or puerpural fever. Cattle plague committees were formed in Dublin and throughout the country, and various Orders in Council, proclamations, and other measures were resorted to by the Government, during this time.

On the 8th of June, the disease was again reported to have broken out in the county Down, within a short distance of the place from which it was so confidently said to have been "stamped out." Dr. Mapother was sent down from Dublin to preside at the examination on the spot, no cattle were allowed to be exported from the infected district, and every precaution was taken to localize and prevent the extension of the cattle plague as far as possible. The disease, however, did not increase, notwithstanding the occurrence of a few isolated, sporadic cases of rinderpest at Enfield, in the county of Meath, and some other parts of the country; and early in August the Veterinary Department reported Ireland to be free from rinderpest, the Cattle Plague Committee adjourned *sine die*, and the cattle trade of the country was freed from the restrictions which had been imposed in consequence of the appearance of the disease in Ireland.

SUMMARY OF SCIENCE.

(Specially Edited and Compiled for the Medical Press and Circular.)

By CHARLES R. C. TICHBORNE, F.C.S.L., F.R.G.S.I., &c.

[The Editor of this Summary wishes it to be understood that he is not responsible for the ideas, theories, or the correctness of statements made in any of the papers quoted in the compilation.]

STUDY UPON SOME PROPERTIES OF FORMIC ACID.—Under the above heading, M. Jodin gives the following curious results as regards the preservative properties of formic acid. He says that we may place intermediately between animal and vegetable life yeast and many other

fungoid growths of a similar nature. They are able to assimilate their nitrogen from ammonia or nitric acid; but they are not able to fix the carbon as the animals are unless it is offered to them in the form of a ternary compound. Amongst all the ternary compounds, vegetable or animal, formic acid is the only one which is not able to associate the nitrogen phosphoric acid and potash to form these fungoid growths. Formic acid, either free or neutralized by an alkaline or earthy base, is not able to produce any such growths at the end of six months; but if we add the formic acid combined with lime or an alkali, and in the presence of a little sugar, the mixture becomes very full of these organisms; and if the experiment is prolonged, the formic acid disappears more or less during the experiment. It is necessary, however, that the acid should be combined. The slightest quantity of free formic is sufficient to preserve the sugar unaltered. Mineral acids have not the same effect, as the sugar is changed in a short time.

Formic acid preserves saccharine solutions much better than carbolic acid. (This statement was not borne out by the experiments of the Editor of this Summary.)

The author placed some muscles in three vessels. The first contained a solution of carbolic acid, the second water acidulated by formic acid, and the third only contained distilled water. The flesh in the carbolic acid solution was preserved much longer than the others. That in the water acidulated by formic acid became putrid more slowly than that in the water, and at the same time presented the peculiarity that it was at last converted into a thick mass of mycelium. At the end of some time the three liquids presented an alkaline reaction. "This explains," says M. Jodin, "why the preservative action of the formic acid was less than the carbolic, as it no longer acted when the solution became alkaline."—*Comptes Rendus and Bul. de la Soc. Chim.*

NEW TEST FOR GLUCOSE IN DIABETIC URINE.—MM. Franconi and Vyveré prepare a test solution as follows:—Nitrate of bismuth is precipitated by a considerable excess of potash, and the mixture is moderately heated, and tartaric acid added, until the precipitate at first formed is dissolved. The reagent is then ready. A few drops of this test boiled with diabetic urine gives a black deposit of metallic bismuth.—*Chemical News.*

THE BRAIN.—The following statistics of the brain are according to M. Bourgoïn ("Chemical Researches on the Brain," *Journal de Pharmacie et de Chimie*):—Cerebrine or cerebriic acid does not contain phosphorus. Cerebrine is found in much larger quantities in the grey matter than in the white.

The average proportion amounts to 2 per cent. of cerebral matter, but this amount may vary very much.

The amount of water present is about 73.5 per cent. of the white substance, and 83 per cent. of the grey.

Phosphorus may become concentrated in the brain, as the largest quantity found belonged to an individual who died of phthisis.

The nitrogenous substance averages about 7 per cent. There are also several albuminoid principles not fully examined.

The cerebral acid of M. Fremy is said by that chemist to contain phosphorus. It has a white crystalline aspect, is soluble in boiling alcohol and in hot ether, it swells up in boiling water, but does not dissolve.

It consisted, according to Fremy, of

Carbon	66.7
Hydrogen	10.6
Nitrogen	2.3
Phosphorus	9
Oxygen	19.5
	100.—

That phosphorus was essential to the composition of cerebriic acid had, previously to M. Bourgoïn's experiments, been denied by Müller and V. Bibra.

MAGNESIUM IN TOXICOLOGICAL EXPERIMENTS.—M. Roussin proposes the use of magnesium instead of zinc in toxicological examinations. It completely precipitates the poisonous metals without the danger of introducing them through the reagent. Arsenic and antimony are not precipitated, but will be found in the gas disengaged. Cobalt, nickel, iron, zinc, manganese, chromium, silver, gold, platinum, bismuth, tin, mercury, copper, lead, cadmium, and thallium are precipitated from their solutions.

ESTIMATION OF TANNIN IN OAK AND OTHER BARKS.—Dr. Lowe says that barks contain a considerable quantity of pectic acid. To estimate the tannin it is necessary to evaporate to dryness and to treat the dried extracts with alcohol, in which pectic acid is insoluble. He then gets rid of the alcohol, redissolves in distilled water, and the tannin can then be determined by the usual methods.

Tannin is now manufactured for medicinal purposes abroad from the hemlock bark.

PREPARATION OF NITRITE OF POTASSIUM.—M. Erdmann gives the following process for the preparation of nitrite of potassium. He recommends the fusion of the nitrate of potash with several times its weight of iron filings or borings in a cast-iron crucible at a carefully regulated red-heat. When a small portion taken from the crucible and tested shows a strong evolution of nitrous acid, the mass is poured from the crucible. When cold the mass is dissolved, and then the undecomposed nitrate is removed by crystallization; the liquid is then supersaturated with nitrous acid, and afterwards evaporated to dryness. The following process, which was published in the *Chemical News*,* the reader will no doubt see that the nitrite of potassium will be applicable to the purpose for which nitrite of sodium is used in the British Pharmacopœia—viz., sp. ether nitrosi. Nitrite of potassium is, we believe, more easily purified than the sodium salt.

ON A NEW REAGENT FOR THE ALKALINE METALS.—M. Debray has presented a memoir upon the above subject to the French Chemical Society, vide *Bulletin de la Société Chimique*, June, 1866. The author says that it is known that phosphomolybdic acid is a sensitive reagent for ammonia and the natural organic bases. This reagent is prepared by treating yellow phosphomolybdate of ammonium by carbonate of sodium. This gives the sodium salt, which is then dissolved in weak nitric acid.

This solution precipitates in acid solutions, potash, and the oxides of cesium, rubidium, and thallium. Soda, lithia, and the other metallic oxides do not give insoluble salts under like circumstances. Solutions of aniline, ethylamine, and the ammonia bases, are precipitated by this acid.

All these precipitates are yellow, and the reactions are very sensitive. M. Debray says that the constitution of this acid is very remarkable, as the quantity of phosphoric acid it contains is so very slight, yet it modifies so profoundly the properties of the molybdic acid.

ON THE SEPARATION OF LIME AND MAGNESIA.—Mr. Sonstadt proposes to separate the two bases, analytically, by the difference in solubility of the tungstates. The salts of lime, even in very weak solutions, gives at a temperature of 40 or 50, a dense precipitate of tungstate of lime. Magnesia only gives a precipitate when very concentrated, but the presence of ammonia or magnesia increase the solubility of the lime precipitate.

The liquor after the separation of the lime by tungstate of soda in an excess of ammonia is treated for magnesia; first adding hydrochloric acid to throw down the excess of tungstic acid employed. The magnesia is precipitated in the ordinary manner. The tungstate of lime should be washed with water containing an excess of ammonia.—*Cosmos.*

HELLEBOREINE AND HELLEBORNE.—Helleboreine is

* Taken from a paper on the nitrous compounds of cobalt and nickel.—*Journ. für Prakt. Chem.*, No. 7, 1866, p. 337.

found in great quantities in black hellebore than in green. The alcoholic solution deposits after some time in a mamillated mass, composed of microscopic crystals, which are at first transparent, but which become white in the air, and fall to a very hygroscopic yellowish powder.

Its formula is $C_{26} H_{44} O_{15}$.

Concentrated sulphuric acid dissolves it with a brownish-red colour, which after a little passes to a violet.

Three hundred milligrammes killed a cat, it being a powerful narcotic poison.

Helleboreine is a more powerful narcotic poison still. Its formula is $C_{36} H_{42} O_6$. It is insoluble in water, more soluble in ether and the fixed oils, and very soluble in boiling alcohol or chloroform.

Hospital Reports.

THE CHOLERA WARDS OF THE HOSPITALS OF LONDON.

THE interruption of our usual weekly report on this subject, caused by the Students' Number happening towards the decline of the epidemic, is of less consequence than it would otherwise have been, especially as nothing particularly new has been tried in the treatment. Cases continue to be received at these hospitals of which we have heretofore given reports, and there does not seem to be a marked diminution in the urgency of the symptoms. At any rate, we may safely assert that some of the more recent cases have been as severe as many of the earlier ones.

LONDON HOSPITAL.

SINCE the commencement of the outbreak the admissions up to the 20th inst. have reached the figures 769, of which 532 have been cases of cholera, and 232 choleraic diarrhœa. The deaths have been 282 from the former disease and 20 from the latter, while the recoveries have numbered 232 and 195 respectively, leaving 40 patients, of whom 23 are suffering from cholera, still under treatment. The following is the table for the week:—

	Admissions.	Recoveries.	Deaths.	Remain.
Cholera	16	15	5	23
Diarrhœa	8	21	1	40

We have already reported several times the cases of venous injections, and are happy to be able to say that some fresh recoveries have taken place under this method of treatment. It is to be anticipated that further trials will be made, not only with saline fluids, but with some nutrient and heat-giving liquids; such, for example, as that proposed by Dr. Richardson, and to which attention was drawn in our report of the proceedings of the British Medical Association.

During the last ten days seven other cases have been treated by the injection of saline fluids into the veins. In each case the operation was performed by Mr. L. S. Little. The cases submitted to this treatment were all amongst the worst admitted; all were, in fact, pulseless. Four of them have proved fatal, the other three are doing well. It is only fair, however, to record that two of those who died were suffering from severe organic disease, for such a complication might readily affect the results of any kind of treatment.

Of the recoveries—one, a man 40 years of age—was injected three times in eighteen hours. Each time eighty ounces of saline fluid, to which alcohol was added in the proportion of two drachms to a pint, were injected.

The second successful case of this series was that of a woman 35 years old, who was twice injected with the same quantity of this fluid.

The third case was that of a child only seven years of age. This was injected once with thirty ounces of the fluid.

The cases that recovered were quite as severe as those

which died, and perhaps previous disease may in some measure account for the different results.

In these cases a syringe was not employed. The fluid was allowed to flow by the force of gravity from a vessel placed at a higher level. It was kept at a suitable temperature by means of a spirit lamp, and conveyed through an india-rubber tube with a silver nozzle into the vein.

When the apparatus is placed from six inches to a foot above the patient, the operation occupies about ten minutes. When done more slowly it has apparently not quite so good effects.

The injection invariably restores the pulse, lessens the difficulty and frequency of breathing, and stops cramps and vomiting. It is generally followed by a rigor, with a rise of temperature in the axilla, profuse perspiration, and sleepiness. It is also not a little remarkable that little or no reactionary fever has occurred in any case injected.

Now, the reaction has lately proved fatal in many cases of cholera in which there had been only slight collapse, so that this fact assumes a singular significance.

Such are some of the latest points we have been able to gather on this important subject. On a future occasion we hope to enter fully upon a complete examination of this as well as other modes of treatment.

THE DISTRICT CHOLERA HOSPITALS.

Two cases have been treated by venous injections at the Limehouse Hospital, under the care of Dr. Woodman and Mr. Heckford. In one convalescence is fully established; the other has unfortunately terminated fatally. The fluid employed contained three drachms of chloride of sodium and two scruples of carbonate of soda in six pints. It was employed at a temperature of 102° Fahr.

At Bethnal-green, Dr. Sutton has recently employed bleeding in some cases of collapse. In one instance, at least, the treatment seemed to afford relief. Under Dr. Sutton, also, chloroform has been inhaled for a prolonged period, several hours altogether. Cramps were greatly relieved, the respiration became easier, and sleep was obtained. In one case convalescence seems to have set in. The treatment will probably receive a further trial, as will other methods, all of which we shall report from time to time as opportunity occurs.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS.

DR. LYONS'S CLINIQUE.

CHOLERA TYPHOID.

THE patient having passed through the perils of the periods of invasion and collapse, has yet, in many instances, to run the gauntlet of dangers which seriously threaten life, and, in not a few instances, prove fatal. In favourable instances, and in a far greater proportion in some epidemics than in others, the patient who recovers from cholera passes at once and *frankly* into a state of complete convalescence, and the man who is to-day in the fully-developed blue collapsed stage of cholera, may be within three days up and able to resume his avocations. In other instances, convalescence is established as a slow and gradual process, the patient does not at once shake off all appearances of the collapsed stage, and in a day or two it will be found that he has glided into a condition of secondary pyrexia, marked by quick and irritable pulse, foul tongue, and hot skin. More or less tendency to diarrhœa, with pain and other symptoms of intestinal irritation, are now manifested, and on careful palpation the abdomen is found hot, and gurgling is detected in the ilio-cœcal region. In cases likely to prove fatal, diarrhœa becomes now a constant symptom; thirst, depression, uneasiness, if not actual pain, in the bowels is complained of; there may be wandering or delirium, and the general

aspect and condition of the patient are such as to produce the closest possible similarity to, if not identity with, true typhoid or enteric fever; and in fact pathological anatomy reveals to us that a lesion is now progressing in the intestine, in all essential respects the same as that which characterizes the fever in question.

Pathological Anatomy of Cholera Typhoid.—It has been seen that one of the most frequent lesions observable post-mortem in fatal cases of cholera is a loaded and turgid state of the solitary and aggregate follicles of the small intestine. The general colour of the jejunum and ilium is that of a pale rose pink; conspicuous upon this ground will be noticed, more or less prominently so in different cases, a multitude of little granular bodies varying in size from a pin's head to a couple of lines in diameter, of a dirty cream colour, but occasionally whitish. These will be found to be the solitary glands, surcharged with a quantity of matter, which, when viewed under the microscope, exhibits an infinite number of amorphous granules, but no formed elements. The patches of Peyer will be found to exhibit a similar condition, and in the lower few inches of the ilium, both the solitary glands and patches of Peyer are usually very conspicuous, being distinctly elevated above the surface by the amount of deposit with which they are overloaded.

That the condition here described is present in a large majority of cholera cases Dr. Lyons has established by numerous examinations in various epidemics at home and abroad.

In those cases which prove fatal in the primary stage of cholera, time is not allowed for the development of further changes by which any process of elimination could be attempted to rid the glands of the dirty creamy deposit with which they are so remarkably infarcted; but when the patient survives the period of choleraic collapse, he is now, *quoad* the intestines, in the predicament of an individual in that stage of typhoid fever in which deposit has taken place into the solitary and aggregated glands.

That a rapid and safe process of softening of the deposit and its speedy elimination without further mischief to the intestine, is accomplished in numerous instances, we find ample proof in the rapid and complete convalescence, without further bowel irritation of the slightest kind, which is to be observed in a large proportion of the recoveries from cholera in many epidemics.

In other instances, on the contrary, the period of recovery from the acute stage of cholera is marked by the accession of the new symptoms of pyrexia and bowel irritation already adverted to. The patient in cholera typhoid is now in identically the same pathological predicament as the patient in true or idiopathic typhoid; both have the same dangers to face, and in both the progress of the lesion in the intestine is the same. A process is now established for the elimination of the creamy matter in the intestines. It may be convenient to recapitulate the various modes by which Nature effects the elimination of deposit from the intestinal glands, whether in idiopathic or in cholera typhoid:—

1. By endosmosis, and by the inherent tendency in all forms of low exudation to undergo mechanical disintegration, the deposit in the glands becomes gradually softened, and under the influence of the gentle pressure constantly being exercised upon it by the constrictive and extrusive action of the circular and longitudinal fibres of the muscular coat of the intestine, it becomes gradually forced out of the glands. This may be regarded as by far the safest to life of all the modes of elimination of glandular deposit in the intestines, and the possibility of its accomplishment and of facilitating its being brought about should ever be uppermost in the mind of the practitioner in dealing with such cases by food or medicine.

2. The pressure of the matter deposited in the glands acts, in many cases, as an irritant on the surrounding tissue elements; increase of vascular action is the result, and soon a process of ulceration is set up; the deposit is broken up and extruded, but there remains a cup-shaped

ulcerated depression, the further extension of the destructive agency of which it is, in many cases, found impossible to check. Ulceration of the intestine in the site of a previously over-charged gland, or patch of glands, is now established. Its results may be (a) gradual extension through the basement structures of the membrane and the muscular coat until it reaches the peritoneum, in which it may, without perforation, set up inflammatory action, or by perforation, lead to general peritonitis and death. (b) The ulcer, in its progress laterally, may open a vessel and lead to alarming, if not fatal, hæmorrhage. (c) The presence of any considerable number of ulcers will lead to constant irritative diarrhœa, under which the patient dies of exhaustion. (d) Ulceration may end in favourable cicatrization (as shown by Lyons and Aitken).

3. In cases of a very extreme amount of deposit, the vessels leading to the glands become choked up, death of the tissues and spiculus of a patch of Peyer, with fatal issue of the case, will be the necessary result. This latter condition, rare in typhoid, has not been verified in the cholera typhoid.

Foreign Medical Literature.

TWO CASES OF BROWN DISCOLORATION OF THE SKIN WITH MORBID AFFECTION OF THE SUPRARENAL CAPSULES.

By W. KOSTER.

Translated from the *Nederlandsch Archief voor Genees- en Natuurkunde*, Deel ii., 2e Aflevering, p. 165.

By WM. DANIEL MOORE, M.D. Dub. et Cantab., M.R.I.A., HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS, OF THE NORWEGIAN MEDICAL SOCIETY, AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; EXAMINER IN MATERIA MEDICA AND MEDICAL JURISPRUDENCE IN THE QUEEN'S UNIVERSITY IN IRELAND.

It is not my design on the present occasion to treat in detail of Addison's disease. I shall confine myself to briefly relating two cases, which afford evidence in favour of the connexion between disease of the renal capsules and "bronzed skin," as in both the existence of such an affection was assumed before death, and found on post-mortem examination. Affections of the renal capsules without discoloration of the skin, or the reverse, I have not yet observed in Utrecht.

The first case was the first post-mortem examination which I performed in Utrecht in October, 1862. From Dr. Imans' notes of the course of the disease, and from my own of the examination of the body, I collect the following:—

Cornelia W., aged 63, was admitted into hospital on the 6th of October, 1862. She had already been a considerable time ill; had much diarrhœa, and latterly a cough. She was extremely emaciated and debilitated, and every movement was painful to her; her pulse was very small and quick; the abdomen was not tender. There was occasional cough, with slight expectoration of mucopurulent sputa. On the left side, the sound on percussion of the chest from above was very dull; above and behind, close to the scapula, large râles and bronchial respiration were heard, on the right the alteration of the physical signs was less marked.

The diarrhœa and the cough continued for some days after the patient's admission. A bed-sore, in the sacral region, which was present at the time of her admission, gradually increased. The woman died on October 13th. Little brown spots had been observed on the arms, back, and chest, yellowish-brown discoloration of the face, and dark-brown discoloration of the forearms and elbows. On account of these we suspected, in addition to the evident tuberculosis of the lungs, the existence of tuberculosis of the supra-renal capsules.

At the post-mortem examination, on the following day, we found in the cavity of the skull no particulars worthy

of note. In the chest the organs lay in their normal position: The right lung contained many whitish yellow, scattered firm tubercles in the superior lobe, some in the middle, none in the inferior lobe. In the upper lobe of the left lung were tubercles and tubercular masses, partly softened, besides cavities of various sizes. In the lower lobe of this lung were isolated tubercles and lobularly inflamed spots.

There was no tuberculosis of the small intestines, but there was of the colon, without considerable ulceration. The kidneys were normal, but the size of the supra-renal capsules, especially of the right one, at once struck the eye. The latter was swollen in the middle to a great tubercle. On section this tubercle was seen to consist of a whitish yellow caseous mass, in the centre in a far advanced state of softening, at the periphery it was still firm. A thin layer of brown matter surrounded the tubercular mass. No particulars are given of the microscopic examination of the latter.

The left supra-renal capsule contained in its centre a larger yellowish and not yet softened tubercle, and moreover scattered through the whole tissue many smaller tubercles.

The second case I witnessed not long ago. In this instance, too, before proceeding with the students to examine the body, I pointed out, on account of the brown discoloration of the skin, which was very strongly developed, the great probability of the existence of disease of the supra-renal capsules. Although this case was in other respects also not devoid of interest, I shall here mention only the particulars from the report of the post-mortem examination and from the remarks made before one of the pathological lectures, which bear upon our present subject. Of the course of the disease during life nothing was known. The poor wretched woman was brought one evening, by persons who scarcely knew her, from her dwelling to the hospital, where she arrived labouring under violent dyspnoea, and in a semi-comatose state, and died in a few hours.

The brown discoloration of the skin was very extensive. In the face both cheeks were of a brownish yellow, with a sharp boundary in the zygomatic region. The white of the eyes was not discoloured. On the neck, as well as on the chest, were scattered irregular brown spots. The skin of the thighs, especially on the outside, was of a bronze colour; along the surface of the back and side, were small dark brown speckles and larger brown spots.

The most important anatomical abnormalities which were found consisted in: far advanced lardaceous degeneration of the two kidneys, ascites, anasarca, copious hydrothorax, dilatation of the right side of the heart, slight cirrhosis of the liver, atrophy of the spleen, and the change of the supra-renal capsules to be more particularly described.

The left supra-renal capsule was half as large again as the right, which latter was of the usual size. The former exhibited in the middle a thick tubercle, extending chiefly downwards, and tapering in that direction. On dividing the capsule the yellow cortical layer over the thickened part seemed to be quite pushed aside; only here and there did some islets of it still remain. The newly formed mass took the place of the former medullary matter, and had a greyish white, not shining, lardaceous appearance; it was moderately firm.

On microscopic examination it appeared to consist of an amorphous mass of connective tissue, with some small cells hanging to each other like garlands, and also of a larger quantity of globules of a dull lustre, and of various sizes, and masses of irregular form. The globules did not disappear in ether, or did so only to a slight extent; the larger masses in part assumed a beautiful blue colour on the addition of Schultz's reagent. The nervous ramifications which still adhered to the gland, were in part examined: no changes of any importance were observed.

The right supra-renal capsule contained superiorly a cavity, filled with a viscid, thick brown matter, such as is often met with in advanced age. Inferiorly the appear-

ance and structure of the gland might be described as normal.

I communicate these two cases only as contributions to the statistics of the disease, I was unable to make a more accurate investigation of the amyloid change of the capsule in the latter case, and of the state of the solar plexus and of the abdominal portion of the sympathetic nerve. As yet only Quekett and Boogaard* have examined the nerves of the solar plexus in disease of the supra-renal capsules. Virchow,† who adheres to the opinion of the great probability of a connexion between affections of the supra-renal capsules and changes of the sympathetic nerve, also appears not himself to have made any examination of the nerves. The pressure of business of another kind, with defective assistance, made it impossible for me to investigate the matter more fully in either case. The question therefore remains to be followed up.

M. BOUCHUT ON THE DIAGNOSIS OF
SYMPTOMATIC AND ESSENTIAL PARALYSIS
OF THE
SIXTH PAIR OF NERVES,
BY MEANS OF THE OPHTHALMOSCOPE.

Translated from *L'Union Médicale*, July 3rd, 1866.

By BALTHAZAR W. FOSTER, M.D., F.L.S.,

PROFESSOR OF CLINICAL MEDICINE IN QUEEN'S COLLEGE, AND PHYSICIAN
TO THE QUEEN'S HOSPITAL, BIRMINGHAM.

(Continued from page 152.)

Case 3.—*Chronic Encephalitis; Double Convergent Strabismus; Ophthalmoscopy; Optic Neuritis, and Granular Retinitis.*—Louise Bance, *ætat.* 3 years, was admitted on the 8th of May, 1866, into St. Catherine's ward, at the Hospital for Sick Children. This child had walked with difficulty for some months, in consequence of rachitis, and had had diarrhoea for a long time. Moreover, when one year old, without having had convulsions or any particular illness, she was attacked by paralysis of both the sixth nerves, characterised by convergent strabismus of both eyes.

Present State.—The child shows curvature inwards of the tibia and of the femora, with enlargement of the articular extremities; both wrists are also enlarged; the chest is depressed laterally, and presents the peculiar rachitic form. Her stomach is very large, and the vertebral column is curved forward, on a level with the lumbar region, as is the case in patients affected with rickets; her extremities do not pain her, but she walks with much difficulty; diarrhoea very frequent, with yellow stools; no vomiting and but little thirst; good appetite and no fever.

The subnitrate of bismuth (two grammes) and phosphate of lime (one gramme) cured this diarrhoea in a few days.

On examining the strabismus both eyes showed a deviation to the internal side of the eye, but when the patient was made to look outwards, the eye could move itself beyond the median line. However, inasmuch as the child is young, and has not much sense, she cannot assist in the experiments which one wishes to make, in order to investigate the movements of the organ of vision. The fundus of the eye, examined with the ophthalmoscope by M. Meyer and myself, presents on the left side an irregular papilla, triangular in shape, with ill-defined angles, slanting away on the internal and superior side, where it is veiled by a greyish radiating infiltration, which masks all the vessels. The veins above and below are numerous and dilated, and curved back on the external side, thus forming a semi-circle, the concavity of which is turned outwards. The right eye presents slight serous infiltration, half covering the vessels of the papilla, and below this point, the retinal vein, not well marked, on leaving the edge of the papilla, appears red and dilated upon the retina, so that it appears very large below the papilla, and very much compressed on the surface of this part. This child after a month's

* *Nederl. Tijdschrift. v. geneeskunde*, 1858, p. 663.

† *Die krankhafte Geschwülste*, Band ii., pp. 701 et seq.

stay in the hospital was taken home by her parents in the same state.

Remarks.—Notwithstanding the incompleteness of this case, with reference to the pathological condition of the brain, it is of much interest in connexion with the subject which occupies us. It is evident that without the aid of the ophthalmoscope this double convergent strabismus might have passed for a muscular affection or for a hypermetropia. But on the discovery of considerable morbid changes in the fundus oculi, on the retina, and on the papilla, we were led to make another diagnosis, and to consider the deviation of the eyes as a consequence of the disease of the optic nerve and of the retina, which in its turn led us to suspect a similar lesion beyond the orbit, in the membranes or the brain. This is an example of what in Germany is called a "descending neuritis," to express the fact that a disease originally developed in the brain has extended to the ocular globe.

Case 4.—*Chronic Encephalitis; Nystagmus; Weakness of the Intellectual Faculties; Impairment of Sight; Atrophy of the Papillæ of the Optic Nerves; Serous Infiltration around the Papilla, on the right side.*—Louise Meret, ætat 12 years, was admitted June 11th, 1866, into St. Catherine's ward, at the Hospital for Sick Children. This child had had, when three years old, a sudden and severe attack of convulsions of considerable duration, after which there remained a double convergent strabismus, and a state of intellectual weakness which prevented her learning to read or work.

Present State.—Both eyes show a little nystagmus; they are turned inwards, and the right is very weak. She cannot thread a fine needle, because she cannot see the eye, and she is not able to sew without pricking her fingers. She distinguishes small objects with difficulty; her mental condition is weak, and she appears in a state of half imbecility, without paralysis or convulsions. The digestive functions are in a very good state. Both papillæ are very small, flattened, white, pearly, and bright; on the right side this appearance only exists internally, for on the outside there is a serous infiltration, which makes the contour of the papilla externally, confused and scarcely visible. The arteries are seen with difficulty, and the veins are very small. The child's health is excellent in every respect, and as she showed no symptoms except strabismus and imbecility, she soon left the hospital in the same state as when she entered.

Remarks.—If there is not in this record any pathological condition which can enable us to recognize the lesion of the brain which existed in the case of Louise Meret, it is certain from the existence of converging strabismus, with nystagmus and atrophy of the optic papillæ coming on slowly after convulsions, that the brain and the membranes were affected by such a partial chronic inflammation as is compatible with life. The origin and the progress of the symptoms, and the gradual enfeebling of vision, together with atrophy of the papilla on both sides, are a proof of it. Here, again, the ophthalmoscope enabled us to complete an uncertain diagnosis, and the results obtained by its use formed an addition to the clinical investigation of ordinary symptoms. The ophthalmoscope furnished unexpected light as we have just seen in the preceding cases, and gave an exactness to our diagnosis which we could not have attained without its aid. It enabled us to discover morbid conditions of the fundus oculi, indicative of an organic lesion of the brain or its membranes, in cases where the diagnosis was doubtful, and where one could only form hypotheses.

Such results are very important and deserve to be made known. Moreover, they complete my researches "On the

Diagnosis of Diseases of the Nervous System, by the Use of the Ophthalmoscope;" and on this account it has seemed to me useful to publish them.

Henceforth, then, in paralysis of the external motor nerve of the eye, we must add the use of the ophthalmoscope to the study of the antecedents and the history, as an essential aid in the detection of the disease. For by its means, we shall often be enabled to detect the organic nature of the lesion by the discovery of a morbid condition of the fundus oculi. The paralysis may be *spondaneous* (Valleix), *rheumatismal*, produced by cold (Badin d'Hurtelbise); it may depend on *constitutional syphilis* (Begrin); *albuminuria* (Landouzy); *diphtheria* or *chlorosis*, *Plumbism*—(as in Case 1), or a *fault of accommodation*, or *optic neuritis*, produced by excessive use of the eyes. It may also be referable to *chronic meningitis*, produced by a wound over the eyebrow, or by a fall on the head (as in Case 2), or finally it may be due to localised chronic encephalitis, or tumour of the brain.

In many cases the evidence furnished by the patients, and the symptoms which they present, suffice for a diagnosis, but in those cases in which there is a suspicion that the cause of the disease is seated in the nerves or nervous centres, the ophthalmoscope alone can determine the question with certainty. In short, if there exists a serous or granular infiltration of the papilla or retina, in consequence of either general or partial congestion, venous thrombosis, or retinal hæmorrhage, we may be satisfied that there has been either *optic neuritis*, or localised *chronic encephalitis*, *chronic meningitis*, or *tumour of the brain*.

These lesions of the eye do not, it is true, always indicate the nature of the cerebral affection; but what is of chief importance is, that their demonstration nevertheless proves the organic nature of the paralysis, and this is undoubtedly a great advance. Let us now consider the history of the children whose cases I have reported.

The first, employed in a type foundry, presented a blue line on the gums, and came to the hospital for a first attack of lead colic, unattended by anæsthesia or any disorder of the intelligence or the senses. Shortly after, when almost cured, she was affected with slight internal strabismus and diplopia, without any pain in the head or great disorder of sight, and we were led to believe in the existence of a paralysis of the sixth or external motor nerve of the eye, due to lead poisoning. We were the more strongly disposed to this diagnosis from the fact, that there had been no disorder of vision except the diplopia. What, then, was my surprise, when, after using the ophthalmoscope, I discovered a considerable infiltration of the papilla and optic nerve. In the presence of this condition, I was compelled to modify the diagnosis, and while still admitting the possibility of the lead having acted on the nervous centres, I was able to recognize the existence of a morbid condition of the brain with extensive optic neuritis.

In the second of my patients, the circumstances were different. In consequence of a fall on the head on a staircase, the child was affected with involuntary chorea-like movements on the right side, and considerable difficulty in walking. Afterwards she had convergent strabismus of the right eye, diplopia, repeated vomiting, with constipation, but no fever or cephalalgia. The patient was brought to the hospital in this state, and I considered the paralysis of the sixth pair to be referable to chronic encephalitis, possibly to a tubercle of the brain. I was not, however, at all certain about it, when I thought of examining her eyes

with the ophthalmoscope. Immediately after the examination, I no longer hesitated, for the granular infiltration of the papilla and the retina, pointed to an optic neuritis, connected with chronic inflammation of the membranes and of the brain, either simple in its nature or complicated with cerebral tubercle.

In this case the ophthalmoscope enabled us by the discovery of very characteristic ocular lesions to form an exact diagnosis, and M. Liebreich, to whom I showed the case, after having himself proved the existence of the above mentioned lesions, was of the same opinion as to their signification.

Finally, the event has justified the correctness of this diagnosis, for the child lost the power of walking, uttered sharp cries, lost her intelligence, had convulsions which lasted for three days, and sank in consequence. The post mortem examination showed us that there had been chronic meningitis with extensive optic neuritis.

Not to dwell longer on these results of cerebroscopy, and not to repeat here what I have elsewhere said of ocular lesions of a *mechanical* or *sympathetic* nature, which the ophthalmoscope enables us to discover in the course of acute and chronic meningitis, in cerebral hæmorrhage, in softening of the brain, in hydrocephalus, intra-cranial tumours, in concussion, in contagion, in compression of the brain, and in maladies of the spinal cord, I shall terminate this paper by saying by way of conclusion—“*Paralysis of the sixth pair or external motor nerves of the eye, symptomatic of a disease of the brain or its membranes, can be sometimes distinguished from idiopathic or essential paralysis, by the fact that lesions of the papilla and retina are frequently present in the former, which do not exist in the latter.*”

Reviews.

A MANUAL OF THE OPERATIONS OF SURGERY FOR THE USE OF SENIOR STUDENTS, HOUSE-SURGEONS, AND JUNIOR PRACTITIONERS. By JOSEPH BELL, M.D., F.R.C.S.Ed. MacLachlan & Stewart, Edinburgh.

For many generations the family of Bell have never wanted a representative in the profession in Edinburgh, and all of them more or less distinguished for their surgical skill. In the end of last century one of the best, the most comprehensive, the most profusely illustrated, and—let us add—the cheapest works on surgery, was published by Benjamin Bell, the great grandfather of the present author, who has very properly brought forward his great forefather's claims to rank high as a practical surgeon, as having been the first to introduce amputation of the thigh by a long anterior flap—a method which has in recent times been re-invented by Mr. Teale, and adopted, with or without modification, by many other surgeons. The present work is, as its name states, simply a manual of operations; the several steps of these are carefully and distinctly described, and where necessary clearly—if somewhat roughly—illustrated by interspersed diagrammatic woodcuts, while four plates from original photographs are given at the commencement of the work, in illustration of the lines of incision in the various operations. The author is a thorough practical anatomist, the surest and only foundation for good operative surgery, and upon that foundation has been based a solid surgical training under one who, though as yet untitled, is not the less the first of British surgeons, whose clinical assistant Dr. Bell has the good fortune to be, and to whom this little work is dedicated; the very permission of the dedication being, to all

those who know the man and his hatred of cant, a sure proof that this little work is well worthy of the attention of those for whose use it has been prepared.

1. SOME OBSERVATIONS ON INCUBATION. By JOHN DAVY, M.D., F.R.SS, Lond. et Edin. Reprinted from the “Transactions of the Royal Society of Edinburgh.” Vol. xxiv. Edinburgh. 1866. 4to pp.12.
2. ON THE CONGELATION OF ANIMALS. By the Same. Reprinted from the “Proceedings of the Royal Society,” No. 86. 1866. 8vo, pp. 6.

THE object of the author in the researches described in the first of the pamphlets above referred to, was twofold: first and principally, to ascertain whether, in the instance of the egg of the common fowl, that which may be presumed to be vital action, can for awhile be arrested, and yet be capable of renewal. Secondly, to observe, however cursorily, the changes which take place in the contents of the egg when vital development has been prevented. We cannot here enter into the details of the experiments which were performed: 1. upon unimpregnated eggs; 2, upon eggs kept at a temperature of about 32°F.; 3, upon eggs subjected to the air pump; 4, upon eggs kept in lime-water; 5, upon eggs in the ordinary process of incubation. We must content ourselves with endeavouring to collect the inferences which Dr. Davy has drawn from them, referring such of our readers as desire to go more fully into the subject, to the Transactions of the Royal Society of Edinburgh.

“The changes experienced in the egg,” observes the author, “as described in the several experiments, are so many and various, and the difficulty of referring them to their causes is so great, that I have much hesitation in drawing any decided inferences from them, especially as regards suspension of vital action, in the trials, whether with the air pump, lime-water, or ice-house, in which incubation was afterwards successful.

“In the various experiments, it may be said that the whole of the oxygen was not withdrawn from the eggs, that a minute portion remained, sufficient to maintain a very low degree of vitality, enough, at least, to place in equilibrium for a time the antagonistic agencies—those administering to life and death.” The author remarks further that in an ice-house, at a temperature of 32° or lower, if not low enough to freeze the egg, action may be diminished seemingly, but not be really arrested, and he quotes the remarkable fact that “the ova of the salmon are, as has recently been ascertained, capable of being hatched after having been kept in ice-water one hundred and twenty days, and thus conveyed to Australia. Whether there can be life without action, or its equivalent change, is a problem which,” continues Dr. Davy, “I hardly venture to approach. In the seeds of certain vegetables, which, circumstances not favouring, remain without germinating months and years, there seems to be during the period an arrest of vital force or action; and yet may it not be more apparent than real. . . . It is possible that during the whole period, however long, there may be a very feeble action, though imperceptible, sustaining life. . . . What we witness in certain hibernating animals seems to favour our doubts. In the instance of the dormouse, in the depth of winter, there are no distinct indications observable of life; its temperature is about that of the air; no arterial action is perceptible; yet it would appear that the heart's action, and the action of secreting organs, is not absolutely suspended. Even congelation itself, it may be conjectured, may be compatible with the retention of a low vital force, more or less morbid or deranged, at least congelation, I have found, does not entirely arrest action in the blood, ammonia being formed in it, and evolved from it when frozen.”

2. In the second pamphlet on our list, Dr. Davy describes some experiments undertaken in consequence of the appear-

ance of "a very interesting and elaborate paper by M. Puget," on the congelation of animals. In this paper, published in the *Journal de l'Anatomie et de la Physiologie* for January and February 1866, the writer had referred to a statement made by Dr. Davy many years ago, that the leech may be frozen without loss of life. The experiments instituted by M. Puget, which, according to Dr. Davy, appear to have been conducted with great care, led that observer to an opposite conclusion—viz., that congelation is fatal not only to the leech, but to animals generally, without a single exception. Davy's subsequent researches confirm this opinion of M. Puget, though he differs from the French physiologist as to the cause of death in such cases, M. Puget considering the *vera causa* to be an altered condition of the blood, while Dr. Davy attributes the fatal result to the freezing of the organs, not excluding the blood, rather than to the freezing of the blood alone. The question is, however, evidently one, which it will never be possible to decide experimentally.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 26, 1866.

THE POOR-LAW BOARD AND THE SICK POOR.

It is very much to be feared that the cause of the sick poor will not be much advanced, if it is not positively retarded, by the political changes which have lately occurred at the Poor-law Board, owing to the installation of a new Ministry. On the principle that "new brooms sweep clean," it might have been hoped, and indeed expected, that Mr. GATHORNE HARDY would have signalled his advent to office by the adoption of some measures to alleviate the condition of the sick poor in the Workhouses, or at least that he would have followed in the steps of his predecessor, Mr. VILLIERS, who, we really believe, was anxious to introduce some plan of reform based upon the evidence already received. But Mr. HARDY, on the contrary, seems to have pursued a retrograde course, and while he has displaced a very zealous officer, Mr. FARNALL, from his post, as one of the Metropolitan Poor-law Inspectors, he has shown a tendency to bolster up the misdoings and shortcomings of the guardians and other local authorities, who have most justly earned for themselves, by their cruelty, their ignorance, and their arrogance, the execration of the community. For a very long period the mismanagement of the local boards, in reference to the treatment of the sick poor, was concealed from the public, and any attempt to reveal "the secrets of the prison-house" was promptly met on the part of the authorities by the punishment of the unlucky but too honest officials who ventured to withdraw the veil.

Of late, however, as is well known, several cases have occurred in some of the workhouses, exhibiting the system pursued in the treatment of the sick paupers, and so great has been the surprise at the revelations made, that the whole machinery of the Poor-law has

been dragged to light, and the system has been put anew upon its trial. Mr. VILLIERS, the late President of the Poor-law Board, at once candidly admitted the defects of the existing arrangements, and set about cleansing the Augean stable, Herculean as the task was confessed to be, and both Houses of Parliament, although generally unwilling to interfere with local government, expressed their readiness to adopt any remedial measures which might be brought forward.

But in an evil hour, as we believe, for Poor-law Reform, Mr. VILLIERS retired from his place at the Poor-law Board, and was succeeded by Mr. HARDY, whose policy, as far as it can yet be understood, appears to be to conciliate the Guardians and perpetuate the vicious system they have so long pursued, and to discourage any efforts made towards a thorough and comprehensive scheme of improvement.

But perhaps the most serious obstacle to the progress of humane legislation is to be found in the conflicting views emanating from the two Poor-law Inspectors whose reports on the condition of the Metropolitan Workhouse Infirmaries have recently been published. That of Mr. FARNALL is in accordance with the evidence so often given as to the inadequacy of the existing accommodations, and his advice, founded on his experience and his observations, tends towards a complete re-organization of the infirmaries and a summary demolition of several of the number. He also deals gently, though by no means undeservedly so, with the Poor-law Medical Officers, representing the inadequacy of their salaries and the conscientious manner in which they discharge their duties.

Dr. SMITH, on the other hand, although himself a medical man, while admitting nearly all the evils alleged against the present arrangements, thinks that improvement may be safely left in the hands of the local boards, although universal testimony is borne to the thorough incompetence of these bodies. But what is still worse in Dr. SMITH'S Report is, that he actually throws the blame of workhouse infirmary mismanagement on the Poor-law Medical Officers, being apparently in entire ignorance that whatever improvement has ever been made in the treatment of the sick paupers is due to those gentlemen. He accuses them, for instance, "of indifference" and of "want of due consideration of and knowledge upon" ventilation, while his own conclusions upon the subject are at variance with those of the most eminent authorities; and he doubts whether the Medical Officers have pressed upon the local Boards the existence of sanitary defects and the best methods of rectifying them. He also actually recommends that when the Medical Officers have "remonstrated with the Guardians" on those and other matters, they should communicate with the Poor-law Board, although he might have known that such a step would lead to the inevitable injury of any Medical Officer who should be honest and bold enough to take such a step.

If, indeed, the Poor-law Board had done its duty and

made its periodical inspections really efficient, and had protected the Poor-law Medical Officers in the discharge of their duties, many of the evils lately brought to light would long ago have been remedied; but the Board, apparently for political reasons, has pursued a pitifully mean course in upholding the Boards of Guardians, and we very much fear that Mr. GATHORNE HARDY is about to revive this contemptible policy. If we do him any injustice in this surmise, we shall be happy to alter our opinion when we have seen a little more of the measures of reform which he has expressed his intention to inaugurate.

SANITARY STATE OF THE CITY.

THE Report of Dr. Letheby for a period of six weeks has just been issued. It appears that 2124 inspections of houses had taken place, resulting in 919 orders for sanitary improvements. 3000 houses had been disinfected with chloride of lime from 3 to 7 times over, and 147 public courts had been limewashed. A staff of 16 men had been employed every night in cleansing, flushing, and disinfecting 184 courts considered to require it; and the streets had been daily watered with a solution of carbolic acid. In addition to the usual city staff, from 44 to 90 men had been daily at work. Upwards of 7 tons of chloride of lime and 1000 gallons of carbolic acid, besides a large quantity of carbolate of lime, had been used. In consequence of the compulsory disuse of the city pumps a large number of stand-pipes provided with a constant supply of water had been erected. The inspector of shipping had inspected 53 vessels, chiefly steamers; six were found defective in cleanliness and ventilation where the crew sleep, and the captain of one had died of cholera.

The markets, slaughter-houses, and cow-houses had been inspected, and about 30,000 lbs. of meat condemned as unfit for human food. This had all been destroyed, and in four cases it was recommended that further investigation should be made with a view to legal proceedings. In four cases fines had been inflicted for exposing unwholesome food and putrid hides for sale in the city markets.

As to the mortality, Dr. Letheby reported that the deaths during the six weeks were 319, rather above the average of 290 for the corresponding period of the last ten years. A little over one-third of the deaths (109) had among children of less than 5 years of age, and 75 had been among persons at 60 and upwards. The chief causes of death were:—

“Phthisis, 33; mesenteric disease, 16; hydrocephalus, 4; pneumonia, 7; bronchitis, 9; continued fever, 5; small-pox, 5; scarlet fever, 9; erysipelas, 4; measles, 11; croup, 2; cholera and choleraic diarrhoea, 65; and common diarrhoea, 24—making together 53 deaths from tubercular diseases, 16 from inflammatory affections of the lungs, and 129 from diseases of a zymotic character. Of the 65 deaths from cholera and choleraic diarrhoea, 12 occurred in the workhouses, which are not in the city; and of the remainder (53), 12 were among children of less than five years of age. So also of the 24 deaths from common diarrhoea, 5 were in the workhouses, and of the remainder 5 only were among adults. In the corresponding period of the last ten years the average mortality in the city from alvine flux has been only 5 among adults, instead of 65, and 22 among children, instead of 24. But, although the mortality has been excessive, yet it has not reached to anything like the proportion of the neighbouring districts or even the general average for the whole of the metropolis. In the eastern districts of London the deaths from cholera and choleraic diarrhoea during the last six weeks have been at the rate of

about 375 per 100,000 of the population, and in all London it has been at the rate of nearly 100 per 100,000, whereas in the city it has been only about 47 per 100,000 of the inhabitants, and the mortality from diarrhoea has been but 14 per 100,000, while in the other districts of the metropolis it has ranged from 26 to 61 per 100,000 of the people. He was inclined to think from this that a large proportion of the deaths from diarrhoea in the city had been returned as cholera, or choleraic diarrhoea, for there was no other part of London where the proportion of deaths from diarrhoea was so low. This was further indicated by the sickness returns for the city unions, which showed that of nearly 1500 cases of diarrhoea attended by the union medical officers of the East and West London Unions, only five were reported as having terminated fatally. Even the cases that were entered as cholera must have been of a singularly mild type, for of the 142 which had been returned as cases of cholera, only 13 had terminated fatally, the usual mortality being about one-third. In point of fact although the amount of sickness recorded on the books of the medical visitors was unusually large, yet it was also unusually mild, for of 2393 cases of alvine disorder attended during the last few weeks by the union medical officers, only 21 had terminated fatally. The contrast of this condition of things in the city with what it had been during the same period in the City Workhouse at Bromley was most striking; for there, with a population of less than 800 persons, there had been 27 deaths from cholera, and four from diarrhoea; while in the whole of the city proper, with its 46,000 inhabitants, there had been but 11 deaths from cholera, and six from diarrhoea. The death-rate from cholera in the City Workhouse has been nearly 400 per 10,000 persons, while in the very heart of the city it had been only about two per 10,000. In fact, if the city mortality had been equal to that of the City Workhouse, there would have been 3800 deaths from cholera instead of 53. He would not pretend to account for this remarkable difference in the intensity of the disease; but in so far as it related to the city, it was a subject of sincere thankfulness that its ravages had been confined within so narrow a circle.”

THE POOR-LAW.

THE Poor-law Board have just presented to her Majesty a report of their proceedings during the past year. During the year the sum of £6,264,961 was expended for the relief of the poor. This was £158,422 less than the sum expended in the preceding year. The number of adult able-bodied persons in receipt of relief on 1st January, 1865, was 170,136, as against 149,320 on the same day in the present year—a decrease of 20,816, or 12·2 per cent.

In 1849, when the population of England and Wales was 17,534,000, the mean number of paupers of all classes was 1,088,659, or 6·2 per cent.; and the mean number of adult paupers, exclusive of vagrants, was 228,823, or 21 per cent. of the population.

In 1850 the percentage declined to 5·7 in the one case, and 19 in the other, and it continued to decline, with a slight exception (in 1855 and 1856), until the year 1863, when, with a population of 20,445,000, the mean number of paupers of all classes again rose to 221,749, or 5·3 per cent., and the mean number of adult able-bodied paupers to 1,077,382, or 20·5 per cent. of the population. The returns for 1865 again show a diminution, for the population having increased to 20,881,000, the total mean number of all classes of paupers is given in the report as 951,899, or 4·6 per cent.

Comparing the last day of the last week of each quarter of 1864 and 1865 we find a similar state. On Lady Day, 1864, the number of paupers relieved in London (excluding lunatics in asylums and vagrants) was 100,824. On the same day, 1865, the number had increased to 105,988, or about 5·1 per cent.

The increase for the remaining three-quarters, calculated in the same manner, is 2·5, 1·2, and 4·1 per cent.

respectively. The following table shows the number of insane paupers on the same day :—

Insane Paupers.	Males.	Females.	Total.
Lunatics	12,259	16,207	28,466
Idiots	4,567	5,454	10,021
Total	16,826	21,661	38,487

Of the 39 unions and parishes included in the metropolitan district, 33 have already provided adequate accommodation for the casual poor, and in the remaining six measures are in progress for rendering the accommodation for this class of paupers sufficient. The report then continues :—

“The question of the relief of the wayfarers and the houseless poor having attracted much public attention, and proper facilities for obtaining such relief having been greatly extended in the metropolis, the effect of these measures has necessarily been to increase very considerably the number of applications from this class of persons for relief, as is shown by the following figures :—

Number of vagrants relieved during the week ended the—	Average per Night.
5th May, 1864	4282
— 1865	612
— 1866	7745
— 1866	8421
	1203

“It is not, however, unsatisfactory to us to observe that this increase has taken place, for it enables us to state that there need not and should not now be a houseless poor person in the streets of London

“The Act of the 28th of Victoria, cap. 34, sec. 2, required that the Poor-law Board should cause the wards and other places of reception to be officially inspected, and that the results of such inspection should be reported to the Poor-law Board. In carrying this provision of the Act into effect we thought, having regard to the character of some of the persons relieved in these wards, that such inspection would most effectually and satisfactorily be made by officers connected with the Metropolitan Police. We therefore communicated with Sir Richard Mayne on the subject, who readily undertook to have the inspection conducted by the superintendents and inspectors of police at the nearest station to each ward. The required inspection has accordingly taken place, and the result has been reported to the Board from time to time in a form provided for the purpose. The reports, with some few exceptions, have been satisfactory, and in those cases in which any defects appeared to exist in the arrangements or management of the wards we have brought the matter under the consideration of the guardians with a view to their remedy.

“The number of vagrants received nightly into each of the several wards appears from these returns to vary considerably; but the total number in the 39 unions and parishes comprised in the metropolitan district averages from 1000 to 1100 persons nightly, besides those who may have been sent to licensed lodging-houses. The total accommodation provided is for 2136 persons, which therefore appears ample for the intended purpose. We believe that the objects of the Metropolitan Houseless Poor Acts have been fully secured, and that at a cost trifling in amount, when extended over the whole metropolis, a great improvement has been made in the relief of this class of cases.

“We think it desirable that the dietary for the inmates of the vagrant wards, and the general arrangements for their relief, should be of the same character in all the wards; and we have therefore issued a general order prescribing a uniform dietary for them, and have sanctioned tasks of work of a similar character to be performed for the relief afforded in all the wards.

“We have continued to give much attention to the important question of medical relief to the sick poor. We did not think it advisable to issue any positive regulation on the subject, but the course which we have taken of bringing the question under the notice of the guardians has had a satisfactory result.

“The state of the workhouse infirmaries and sick wards particularly in the metropolis, has also engaged our serious attention; and we have thought it advisable to obtain reports from Mr. Farnall, C.B., and Dr. Edward Smith, F.R.S., two of our inspectors, as to the existing accommodation and management of the sick wards and infirmaries attached to the metropolitan workhouses. On the receipt

of their reports, the measures which may be necessary to improve the administration of this important branch of relief in the metropolis will receive our careful consideration.

“With the view of promoting a better system of nursing in the hospitals and sick wards of the workhouses throughout the country we issued a circular letter, dated the 5th of May, 1865, pointing out the expediency of providing a sufficient number of competent paid nurses, and we have the satisfaction of stating that the suggestions made in that letter have led to the appointment of additional nurses in many workhouses. We also think it right to mention that in the parish of Liverpool, through the munificent assistance of a gentleman of that town, Mr. W. Rathboun, jun., who has placed at the disposal of the select vestry a sum of £1000 a year for three years, arrangements have been made for introducing into one of the hospitals of the very large workhouse of the parish a system of nursing by trained nurses. We have received from Mr. Corbett, the inspector of the district, copies of reports lately made by the master of the workhouse and the medical officers to the Workhouse Committee on the subject. These reports show that much benefit has already been gained from the measure, both in the actual nursing of the sick and the general state of the hospital. We shall watch with much interest the further results of this experiment.”

Respecting the education of pauper children, the report gives a summary of the average daily number attending workhouse or parochial schools. The total numbers during the half-year ending Lady Day, 1865, were: boys, 16,320; and girls, 15,425. The average number of children (boys and girls) attending district schools during the same period is stated as 2961. The amount paid to boards of guardians out of the Parliamentary grant for salaries of workhouse and district school teachers in this half year was £34,220 7s.

Next comes the subject of vaccination, on which the report says :—

“A summary of the returns received from the several unions and parishes in England and Wales of the number of persons vaccinated by the public vaccinators during the year ended at Michaelmas last is given in the Appendix, pp. 317 *et seq.* This summary shows the number of persons vaccinated during the year to have been 588,361, being an increase upon the number vaccinated during the previous year of 51,149. The summary also shows that the number of cases in which the vaccination has been successful is 578,383, which is an increase of 49,104 upon the number successfully vaccinated last year. The births during the year in the several unions were 742,680, being an increase of 3444 upon the preceding year.”

The report concludes that further legislation “will be required for putting the Poor-law Board on a more permanent footing, and for making the necessary amendments in the laws.”

PAUPER VERSUS CRIMINAL.

DURING the year 1865 the average number of criminals in the prisons in Scotland was 2418, the total cases of sickness were 1050, and the deaths 26. The average number of paupers in the poorhouses in Scotland for the year ending 30th June, 1865, including lunatics and children, was 7807; of these 2216 died during the year. That is, more than one-fourth of the average number of paupers resident in poorhouses during the year died, while of criminals resident in prisons less than one-ninetieth died, the number of cases of sickness alone among the criminals being less than one-half the cases of deaths among the paupers. True, the average numbers resident vary somewhat, but the populations of both poorhouses and prisons being fluctuating, they represent nearly the same actual population—viz., 30,195 paupers and 28,510 criminals; the number of criminals is, therefore, very little below that of the paupers. Criminals are, however, comparatively in the prime of life, while residents in poorhouses are mostly children or adults,

enfeebled by disease or age. To a large extent, therefore, poorhouses are hospitals for the care and treatment of the disabled poor, and this to a considerable extent explains the large amount of sickness and mortality. But for the treatment of such a class, all medical experience is in favour of an ample supply of nutritive and restorative food, without which all other treatment is vain. Our prison dietaries have been fixed upon the most ample data, carefully ascertained by repeated weighing of the prisoners, and has been found fully adequate to sustain the weights of the prisoners under normal sanitary circumstances. We have, however, no published evidence that the same care has been taken in regard to testing the value of pauper dietaries, while the debilitated and diseased frames of paupers actually require more nourishment, and his statutory claim for relief entitles him to at least as much protection from the causes of disease as a criminal. In the Appendix to the Report of the Prison Managers for Scotland, there is a very valuable report by Professor Christison and Mr. Thomson, Surgeon to the Perth General Prison, on the prison dietaries of Scotland, giving a full statement as to the amount and nature of the food supplied, as well as to its influence in maintaining the health of the prisoners. But no such scientific information is afforded us as to the dietary of the paupers; 2s. 10½d. a head, we are told, is the average weekly expenditure for the inmates of poorhouses for "food, fuel, clothing, light, and all other necessities of maintenance," but till we have more definite and precise statements, we have no means of judging whether this sum is sufficient, or whether the unfortunate paupers are not slowly, but not less surely, starved into disease and death. The very large mortality we have pointed out, coupled with the very vague and unsatisfactory statement of expenditure, awaken strong suspicion that all is not as it should be, and that more care is taken of the pockets of the ratepayer than of the welfare of the poor. We know that a marked improvement has taken place in the health of the lunatics in poorhouses since their dietary was improved by the Board of Supervision, and finding it difficult to believe that 2s. 10½d. a head is sufficient to supply all the necessary nutriment, stimulants, and warmth required by the poor debilitated inmates of our poorhouses, while the excessive death-rate shows that more than ordinary causes are at work in producing it, we call upon the Board of Supervision in the name of humanity to supply us with more detailed information in regard to the causes of death, the age at admission and at death, the means of occupation and recreation, the amount and nature of the clothing, the bedding, the food and stimulants supplied, as not till then will we have any data whereby to judge accurately whether our paupers are not sacrificed to our parsimony by being treated in a manner to which our enlightened Government will not submit its criminals, who are surely not more entitled to its fatherly care than those whose only crime it is to have been overtaken by misfortune or disease.

THE GERMS OF CHOLERA.

IN consequence of Professor Frankland's recent letter to the Registrar-General, expressing a belief that the germs of disease might not be destroyed by boiling the water in which they were present, an animated controversy has been going on for the last week or two, and a letter in the *Times* has appeared under the well-known signature "S. G. O.," from which we extract the following important and interesting passages:—

"I know from experiment that there are 'germs,' containing a principle of life, that will stand very strange usage, and yet not have that principle destroyed. Many years since I applied a certain matter to a piece of glass about 4 in. square. This has another very thin piece of the same

material cemented over it close on three sides, leaving a space just sufficient for a thin stratum of water between the two. It has been exposed for days to the action of the direct rays of the sun, it has been kept for months in the dark, sometimes has been for a year or two left without a particle of water touching its surface, in a very dry place. To amuse friends I have again and again allowed a little water, sometimes filtered, generally of the coldest *spring* nature, to fill up the space between the two glasses,—water I have previously tested for any living organisms. I have never failed, in a few hours, to produce a most beautiful exhibition of one of the most interesting species of infusoria, having beforehand sketched the exact creature I would produce. With the same water in another glass tank, of the same nature but not so prepared, I fail to produce anything at all until it has been left some days, and then the creatures seen are not my old friends. I have read, not seen, that these organisms retain their vitality even when the glass has been made red-hot. I don't say I believe it, but from what I have seen I think it quite possible. I therefore can believe that, granting water has certain 'germs' which can be detected in it before boiling, which germs, received into the human stomach, become a proximate cause of cramps, &c., some germs might exist with great vitality even after the boiling process. I say *some germs*; I do not believe *former germs* would be visible as such, but, as they are only the development of others far more minute, I can credit the fact that in this, the earliest state of vitality, be it animal or vegetable, the matter of such life may be indestructible even by boiling, unless some chemical agency had added to such boiling its own peculiar life-destroying element. But I think it right to urge another view of the subject. I will assume that water in which these germs are found has been *distilled* and filtered again and again. I will defy any one to say how instantaneously it may receive these same germs on its surface as soon as it is exposed to a polluted atmosphere. There is no surface which can be exposed which is not for ever swept by a crowd of organisms floating in the air—aerzoa, as I have named them; many of these we may trace and name, and build theories about them, but there is a vast mass, I believe, which not even the greatest powers of the modern microscope can reach; of those we can see there are very many of which we know nothing; they may be very poisonous, or may have their part in the economy of health. As yet, I am altogether unsatisfied as to their real place in nature, be it for good or evil.

"Drs. Lankester and Hogg have of late referred to the investigations made by myself, and published in your columns. It is quite true that these experiments were made at a period of cholera, but I believe I detected nothing then that I could not detect in a healthy season; it is quite possible, however, that 'germs' which in ordinary seasons may be harmless, at peculiar seasons may assume a pernicious character. When, in your columns, I called attention to the possibility of mapping a smell, I had made the attempt. I have the diagrams I then made of the various air-floated matters I obtained from vegetable and animal substances, in a condition more truly expressed by a stronger word than smelling. There can be no doubt that there are floating matters, particles, germs, molecules, fungoid spores, or whatever we may please to call them, which do vary, according to the source from which we obtain them, but I have ever found with these there were others, to be found at all times in the purest atmosphere. Agreeing, as I do, with those who attribute the spread of contagious diseases, such as cholera or rinderpest, to certain air-borne particles of poisonous matter, I am still of opinion that as yet no one has discovered any particle of which it can be said that it is the special agent of any special disease.

"My own belief is that the danger from all discharges from patients affected with contagious disease exists at its worst when, having become for a time dry, they are afterwards again moistened through damp warm air, or by any other means. I am also of opinion that in a dry state they may give off to draughts of air minute particles, which finding a nidus on any moist mucoid surface, would thus infect. Cleanliness in a sick chamber cannot be too thorough; a cartload of linen and other articles might be sent to the laundress every day, and yet a yard square of dirty linen or of dirty furniture of any kind left for a few days would defeat the most liberal and otherwise careful attempts to keep all things clean. As to the question of boiling water before use, there can be no doubt that it is most advisable, for you

do thus give it the best simple purification in your power. I wish people could be persuaded of the fact that no liquid to be used in cooking in any way as food or medicine should ever be exposed to the action of the atmosphere in a bedroom, sick-room, or ward but for the shortest possible time. If patients must have water, lemonade, &c., handy to them at night, let these be kept in stoppered bottles. Let any microscopist expose plain water, gruel, tea, milk, or barley-water in shallow thin-glass plates to a night's air in any bedchamber, sick-room, or hospital ward, and then carefully examine the surface with a good microscope; he will satisfy himself of the fact that such surfaces are of all others those which receive, to *detain*, a great deal that, for all that we know, may be very deleterious.

"I don't know what water butts may be in London; I know that they are very valuable in the country as breeding places for some of the most interesting organisms we ever exhibit to friends with the microscope. In London I should expect to find them most gratefully prolific. Water originally but partially pure, kept in rotten wood, which probably never was clean, surrounded by all kinds of dirty things and beings, in an atmosphere ever odoriferous, the bottoms and sides of the butts never cleaned, so that vegetation at the sides is nourished by the accumulated deposit at the base, must ever be water of great microscopic promise. I can quite conceive a glass of clean pure water twice a day acting as a powerful tonic alternative in the case of people who have been thus for years vegetarians and insectivorous by compulsion."

WATER SUPPLY.

PREVIOUS to the year 1851 Manchester depended for its water on a company which obtained its supply of about three and a half million gallons daily, partly by pumping, partly from drainage of manured land, and partly from a canal on which there was traffic. Since that date the monopoly has been abolished, and the Corporation provides a constant supply at high pressure of pure soft water, brought from a mountain range twenty miles distant, far away from manured land or buildings. Within the city boundary a rate of ninepence in the pound in the poor-rate assessment is the highest charge. Beyond the boundary five per cent. on the rent is the rate. In each case this includes domestic supply, and sufficient for horses, carriages, baths, &c. The extensive works will furnish 25,000,000 gallons daily, in addition to 14,000,000 daily granted as compensation to millowners for water power. The cost of these works has been about £960,000. A different tariff is established for water used for trading purposes, and this yields a rental of £58,000 per annum, which is continually increasing. With such an example why should London any longer be subject to the monopolies of the water companies? With the Thames embankment and main drainage rapidly approaching completion, it is time to perfect the scheme by establishing an ample supply of pure water. We owe nothing to the companies that have so long given us a scanty supply of impure water in return for the profitable monopolies they have enjoyed. From the many schemes that are brought forward, several might be selected which would soon deliver us from the danger to which we have too long been subjected.

THE CHOLERA.

THE interruption in our weekly reports of the progress of cholera occasioned by our Students' Number, throws upon us the duty of reviewing the returns of two weeks in the present report. This, however, is not to be regretted, since the first two weeks of September have in every epidemic of cholera been particularly noteworthy. We will, therefore, first state the facts recorded by the Regis-

trar-General, and then proceed with our remarks upon this period.

In the thirty-sixth week of the year, which ended on the 8th of September, the total mortality of London was 1335, exceeding by 90 the average number corrected for increase of population. The deaths from cholera were 157, from cholera and diarrhœa together 289. In the previous week, as we have already reported, the deaths from these causes were 198 and 326.

The rate of mortality from cholera and diarrhœa in the eastern districts was rather more than double the mortality of the same diseases in the whole of the metropolis. An undue proportion of deaths also occurred in the southern districts.

In the week ending Saturday, September 15th, the deaths registered in London were 1371, exceeding the estimated number by 153. The deaths from cholera were 182, from diarrhœa 110. Of the deaths from cholera 10 occurred in the west districts, 27 in the north, 20 in the central, 77 in the east, and 48 in the south.

The most striking observation in reference to these figures is one that we have made for several successive weeks—viz., that the excess in the mortality is more than accounted for by the deaths caused by the epidemic. Next, we may notice that although the second week displays an increase in cholera over the preceding week, there is a diminution in diarrhœa, so that we may still hope that the subsidence of the last few weeks may continue. In reference to the first half of September as an important period of the epidemic, we may usefully call to mind that in 1849 no less than 2026 persons died in the first week, and 1682 in the second week of this month. In the year 1854 the deaths in the same weeks were 2050 and 1549 respectively. These figures offer a most encouraging contrast to the present epidemic, in which, in the corresponding weeks, the deaths have been only 157 and 182. So that, although the deaths rose at the commencement of the invasion with unusual rapidity, the decline has taken place much earlier, and promises a much shorter total duration of the disease. It is to be hoped that in place of neglect being caused by this state of things, it may rather renew the energy and vigilance of the local authorities and of the people themselves.

The annual rate of mortality per 1000 was:—

	In the First week of Sept.	In the Second week of Sept.
In London	23	23
— Edinburgh	24	19
— Dublin	30	30
— Liverpool	53	55
— Manchester	28	28

THE RIVER.

It would be unjust in any account of cholera in London not to notice the valuable work that has been done by the managers of the Seaman's Hospital Society. On the representations of Dr. Rooke, the Lords of the Privy Council were written to, and in eight or ten days replied that the matter should have their attention. Nothing having been heard for another week, and the cases on the Thames increasing, the committee took upon themselves the expense and responsibility of carrying out an efficient inspection. Accordingly since the 11th August all the vessels in the river between London Bridge and Woolwich, as well as in the Regent's, and city canals, have been daily visited by the medical officer. More than 10,000 vessels have been inspected and in 1100 or 1200 cases medicines and disin-

fectants have been supplied. These measures were at once followed by a diminution in the number of cases of cholera admitted to the *Belleisle*, and this decrease still continues. We are glad that this society has received a grant from the Mansion House Committee, and trust it may be better supported than it has been by the public; for assuredly no more useful work has been done than that which Dr. Rooke thus originated.

LIVERPOOL.

THE cholera, after some decrease, displays a tendency again to increase in this port. The deaths from the disease during the last four weeks, have been 146, 225, 145, and 182. The total mortality of Liverpool last week was 513. The annual rate of mortality for the eleven weeks of the current quarter has been 50·7 per 1000 persons living. We have already called attention more than once to the fearful rate of mortality in this borough.

THE CONTINENT.

FRANCE.

WE have already echoed the complaints of our French contemporaries respecting the impossibility of obtaining reliable statistics of the epidemic in Paris. At length the *Moniteur* has broken silence with the following statement:— It declares that the number of deaths never exceeded 150 in the day, and that since the 1st Sept., the average number of deaths daily has been 15 in the hospitals and 22 in the city.

We regret to learn that the disease seems to have shown itself at Boulogne-sur-Mer, where the deaths have reached 12 in a day. In Moselle, when it seemed decreasing, four Sisters of Charity and the lady superior of the hospital at Boulay suddenly fell victims to a renewed outbreak.

BELGIUM.

THE *Journal de Médecine* of Brussels furnishes the official returns since the invasion of the kingdom. From it we gather that 31,051 cases, of which 16,690 were fatal, had occurred up to the end of August. Of these in the province of Antwerp there were 6956 cases, and 3575 deaths. In Brabant, the figures were 6597, and 4034. In East Flanders 5904 and 3526.

THE MEDITERRANEAN.

AT Marseilles the epidemic has never been absent all the summer, and consequently it is not surprising that it should find its way to other places along this coast. Last week 60 deaths a day took place at Marseilles. A panic set in and the people fled from the town. In this way the disease is taken to other towns. At Nice the inhabitants who depend on an influx of winter visitors are always ready to trace every case to importation. This was exposed last year, but no doubt the same falsehoods will again be put forth. On Sept. 1st 11 persons were seized in one house in the most open part of the town, and six of these died. Still the people refused to believe it was cholera, and declared the well had been poisoned. Analysis found nothing, and others who drank the water did not suffer.

On the Italian frontier a lazaretto has been established, and fumigation is practised—though with the disease on each side it is hard to say why.

At Genoa 35 deaths per day has been the average, and the people have ignorantly ascribed these to poisoning of the water for political reasons. At San Martino d'Albaro near Genoa, well known to English travellers going to see

the house of Byron, as many as 26 cases had occurred in one day. In the opposite direction, Savona had had a case or two, and doubtless other parts of the Riviera will be visited, although it may suit the people's interest to conceal the fact.

NAPLES.

THE MEDICAL PRESS AND CIRCULAR was the first English journal to announce the invasion of Naples by cholera, and while our medical contemporaries denied the existence of the disease in Italy, we published public and private details of its progress in Naples, Genoa, and other parts of the Peninsula. We regret to add Alexandria and Saluzzo to the places infected, and to state that at Naples it is continually enlarging the area of its attacks. At Torre Annunziata near Naples, 35 deaths per day have recently occurred, and both in this village and in the city some discontent has been evinced through the authorities resolutely putting down processions to saints, as only likely to aggravate the evil. The most healthy portions of Naples, Posilipo and the Vomero, have both been invaded.

We have received the following official returns:—

September.	Cases.	Deaths
3	92	74
4	115	86
5	110	78
6	106	72
7	119	94
8	98	79
9	104	80
10	126	88

Since these dates we are informed of considerable increase, but wait the official statistics.

The hospitals on the 10th contained 55 under treatment, 9 convalescents, and 4 bodies of those who had died that day. There had also been several deaths of soldiers in the barracks.

THE NEW MEDICAL CLUB.

WE are glad to see that the movement initiated by Dr. Lory Marsh for the formation of a Medical Club is progressing favourably. A meeting of the Provisional Committee was held at Mr. Propert's residence on Tuesday last, when there were present, Dr. J. A. Frazer, Deputy Inspector-General; Dr. Richardson, Dr. Lory Marsh, Dr. Foster (Birmingham); Dr. Stilwell, Messrs. Swaby Smith, Grigg, R. Slaughter, and others. Mr. Propert was elected Treasurer. The Honorary Secretary reported that upwards of one hundred names had been enrolled on the list of members, and laid before the committee a number of letters from gentlemen desirous of becoming members of the Club. It was determined to hold a general meeting in October to invite the coöperation of the profession at large, and sub-committees were appointed to frame laws and to report on the probable cost of opening a Club for 500 members early in the ensuing year. A most important, and, we consider, very valuable resolution was passed, suggesting that membership of the Club should be open to gentlemen engaged in the pursuit of the allied sciences. We hear of the success that has attended the effort with much pleasure, as we feel strongly that an institution of the kind contemplated will fill up a gap that has been felt for some years past, and will prove an important step towards promoting that unity of purpose, in the advancement of the interests of medicine, which the profession has so long needed, but not yet successfully obtained.

ADMISSION OF LUNATICS TO DISTRICT ASYLUMS.

We have been prevented by the intervention of our Students' Number, and by other circumstances, from alluding to a series of circumstances which have excited much attention in Dublin, and have been prominently noticed in the *Evening Mail*. The facts are the following:—

The wife of a man of business in Grafton-street made an attempt on the 9th of September at self-destruction by cutting her throat with a razor. Her husband was out of the country, and his partner applied at the Richmond Lunatic Asylum to have her admitted as an urgent case, having previously gotten a certificate from Drs. COLLES and MOORE that it was a dangerous case, and called for immediate admission; but that admission was denied on the grounds that, as the woman was a resident of so respectable a street she must have the means of paying in a private asylum.

It appears that the person who applied for admission, being quite unacquainted with the expenses of maintenance in a private asylum, expressed his opinion to the Resident Physician that the relatives of the patient might be in a position to pay; but subsequently on learning that the cost would in no case be less than £80 per annum with an immediate payment of twenty guineas, he declared that it would be entirely beyond their power to make such provision for her care. The woman was, of course, not admitted to the Richmond Asylum. In a period of less than three weeks the wound in the throat was nearly healed, she became calm and was removed to a friend's house in the country, but she soon relapsed into her previous state of excitement. The husband then had the necessary paper of admission duly filled up, with a declaration that he was unable to pay for her in a private asylum, and handed it to Dr. LALOR, the Resident Physician, in the presence of the two Visiting Physicians, who expressed their approval of having her admitted; still Dr. LALOR would not consent. The medical part of the paper was filled up by a country physician, and the "prominent symptoms" were correctly stated as "delusions and an apprehension of being murdered." The patient was retained at home under apparently very insufficient supervision, for she succeeded in getting the window open and throwing herself out. She was, however, seized by the attendant, who actually held her by one leg hanging out of the window till the people in the street came to his aid and saved her life. The circumstances which led to this hairbreadth escape excited much attention in the public mind, and the conduct of Dr. LALOR has been freely canvassed. The following comment on the case appeared in the *Evening Mail*, and a letter of defence was published by Dr. LALOR in the same journal. This communication starts with the statement that no application for admission was made till the day previous to the attempted suicide. This fact is denied, and, appears to us altogether irrelevant to the question. Dr. LALOR says:

"At the same time that this application was placed in my hands I was asked verbally by the lunatic's husband to admit his wife at once as an urgent case, the power to do so being vested in me, with a discretion for the proper exercise of which I am responsible in the interval between the meeting of the Board of Governors, I declined to admit the party as an urgent case, and referred its consideration to the Governors at their next meeting, held four days after—viz., on the 7th inst. No mention was made in the application paper that the lunatic, whose immediate admission was asked for, was of a suicidal tendency, the prominent symptoms of the case being set forth as "delu-

sions and apprehension of being murdered;" and the important fact that she had attempted to cut her throat about five or six weeks previously nowhere appeared in the document."

From the published facts and Dr. LALOR's admission, his defence, that formal application was not made, is utterly untenable, and it is a special plea, unworthy of any attention, that "no mention of the attempted suicide was made in the application paper." If a case in which throat cutting has been almost effected, and in which two applications have been made for immediate admission be not "urgent," we are at a loss to discover what is.

The suicidal attempt was a patent act, and it is extraordinary that Dr. LALOR should resort to so clumsy a species of special reasoning as to assume the ignorance of a fact with which he was thoroughly conversant, and still further, that he should rely upon it as one of the defences for the course he pursued. In addition, he stated that a medical man of experience was in attendance on the woman at the time of the application, and he therefore felt no anxiety for her safety by a delay of four days.

But it is entirely another question whether Dr. LALOR had just reason for refusing admission on the ground of competence to pay. Dr. LALOR says:—"The residence of the husband in apparently a thriving house of business in such a street as Grafton-street was certainly *prima facie* evidence that the lunatic was not such a poor person as this asylum was intended for, and the statement of his partner as to the husband's means supports this view. Moreover, the paid services of two eminent professional gentlemen had been obtained for the lunatic by her friends from the first manifestation of her insanity, and a fee was offered to a third eminent professional gentleman to see her in addition, so that there appeared no want of money to procure an abundance of eminent professional advice."

We cannot think, however, that the knowledge of these facts justified Dr. LALOR in refusing, at least temporary admission to a person dangerous to herself and others. He had the legal declaration that she was "a poor person, and had no friend who is able or can be obliged to support her in a private lunatic establishment"—the legal certificate of two medical men that she was dangerous—and the recommendation of both the Visiting Physicians of the Asylum; and we submit that he pursued a most injudicious and unwarranted course in refusing admission, and if the woman had killed herself, he would have placed himself and the institution which he represents in a very unpleasant position.

The public will deduce from this case the practical result of the Privy Council Rules for the Management of Asylums, which we opposed in THE MEDICAL PRESS with all our vigour at the time of their enactment. It is a condition of things most dangerous to the asylum system and to the public for whom they are provided, that an official should be permitted by his single voice to overpower the greatest urgency of circumstances and the most energetic remonstrances of others quite as competent to form a judgment. It is not wonderful that such a power should, with perhaps the best intentions, be occasionally misapplied.

THE number of persons vaccinated during the past year in England was 538,361, being an increase of 51,149 upon the previous year.

Notes on Current Topics.

SANATORIA FOR THE INTEMPERATE.—In a letter lately published in the *Pall-Mall Gazette*, Dr. Forbes Winslow discusses a question of very great importance in the present day—namely, the propriety of exercising some control over those persons whose habitual indulgence in alcoholic drinks assumes the form of a disease. The unhappy victims of this habit are not insane in the ordinary and legal sense of the word, and therefore they cannot be placed like ordinary lunatics in a licensed asylum; but Dr. Winslow thinks that establishments in the form of sanatoria might be instituted, where those who are unable by any effort of their own to restrain their morbid appetite would voluntarily submit themselves to control. Institutions of the nature referred to already exist in America, and we believe that the experiment has been tried with some success, although on a small scale, in some parts of Scotland, and the suggestion now made by Dr. Winslow to establish such sanatoria in this country is certainly worthy of attention. The class of cases contemplated would comprise that section of the community, unfortunately a very numerous and an increasing one, who are afflicted with an insatiable craving for alcoholic drinks, under the impulse of a morbid appetite, and to whom the name of *dipsomaniacs*, however much the term may be ridiculed by superficial writers and speakers, is strictly applicable.

THE CASE OF REGINA Versus TOOME.—We should be perhaps wanting in a sense of justice, if we did not add the expression of our opinion to that of many of our contemporaries, both lay and medical, who regard the conviction and severe sentence of the man Toomer as a scandal to our legal system. It will be recollected that this man (of whose immorality there can be no doubt), was tried and convicted of a rape, although the evidence of the medical witness, Mr. O. C. Maurice, entirely negated the supposition that such a crime had been committed. Mr. Maurice has written a letter in which he describes his examination of the prosecutrix within twenty-four hours after the commission of the alleged offence, and he could find no trace of any violence except a few small circular bruises as if made with the tips of the fingers, and one or two small bruises on the shins. Mr. Maurice found no trace of a hymen nor any sign of its having been recently destroyed. He contrasts all these positive facts with the violence said to have been employed, and had evidence taken in connexion with many of the other bearings of the case seem to prove very satisfactorily that the prisoner's punishment has been altogether disproportioned to his offence, and it is still to be hoped that the Home Secretary will see fit to modify the sentence of the judge, which has consigned him to a lengthened period of penal servitude.

UNFOUNDED CHARGE AGAINST A MEDICAL MAN.—The advertisements of the daily newspapers have lately been enlivening the dulness of the autumnal season in London by announcing among their "sensation" articles, a "serious charge against a medical man," and the whole story having been investigated by a coroner and a jury, turns out to be much ado about nothing. Still the case was considered so serious by the Secretary of State

that an order was given to exhume the body of an old gentleman of eighty years of age, who died *last December*, and to institute a toxicological investigation with a view of determining whether the death was or was not due to the administration of poison. The Medical victim of the present annoyance is Dr. Part of Camden Town, a highly respectable practitioner of many years' standing, who by implication was supposed to be incupated. The deceased old gentleman in question appears to have been a person of eccentric habits, and was possessed of a considerable sum of ready money, and, *hinc illic lacrymæ*, he took it into his head to leave his property to Dr. Part, and to make him his executor, instead of bequeathing it to other parties. As to the medical and pathological facts of the case, they lie in a nutshell; the deceased seems to have died of old age and bronchitis, and Dr. Part administered only such medicines as appeared suitable to the occasion. As to the legal bearings, everything is said to have been done in proper form, and Dr. Part may be fairly congratulated on having come quite unexpectedly, but quite honestly and legitimately, into the possession of a handsome sum of money. Such lucky chances sometimes fall to the lot of doctors, although not so often as to other classes of the community. The only toxicological feature presented by the evidence of Dr. J. D. Rodgers, who made a chemical examination of the body of the deceased, was that a small trace of *arsenic* was found in the contents of the stomach, but there was no evidence whatever produced as to the manner in which it came there. None existed in the medicines administered before death, nor was any utensil employed in cooking the food, whereby any of this poison could be conveyed into the system, and Dr. Rodgers repudiates the idea of any arsenic being present in a healthy body, or in the soil of a grave-yard. The quantity of arsenic discovered was quite insignificant and not by any means enough to cause death.

Correspondence.

THE CHANGE OF TYPE QUESTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Like the flickering spurt of an expiring candle the change of type question has flared up in a leader in your number for September 5. I have no desire to enter at large upon that question at present, given up by Sir Thomas Watson and by all the leaders of medical thought amenable to reason, change of type is doomed, and in a few years will be heard of no more. But, Sir, when you state that the British medical public were unacquainted with influenza before 1833, you surely forgot the writings of Short, of Huxham, Whytt, Heberden, Fothergill, Haygarth, and many other physicians who have described many epidemics of this nature. And when in like manner you state that epidemic diphtherite was unknown in Britain before 1859, you also forgot—not to go back on the many recorded epidemics which were assuredly diphtherite, though not so termed—the writings of Abercrombie, of Professor Hamilton of Edinburgh, and of Mr. William Robertson of Kelso, as well as the fact that there are men now alive who recognized and treated epidemic diphtherite more than thirty years ago. Such omissions are unpardonable in an article dealing professedly with medical history, and are not likely to increase confidence in the opinions expressed. Further you ask whether, "On comparing a record of patients in some great hospital for a year, say in 1820, with another similar annual record in 1860, will it not be found that in the former period

heret was more inflammatory croup, more sthenic pneumonia, phrenitis, congestion of the brain, &c., while in the latter period there was more neuralgia, more influenza, and diphtheria, and other diseases known to be of an asthenic character?" Now I hold that in a question of confessedly so much importance as this, such *ad captandum* queries are a trifling with the dearest interests of humanity. If the case be as you state it, bring forward the proof, and you will then be more likely to convert those who with me have adopted what seems to be the more philosophic opinion of the uniformity of disease in all ages. A uniformity—mark me—which does not exclude the occurrence of epidemics of pneumonia, of typhus, of enteric fever, or of other diseases at various times, but which holds that these diseases present at all times—each for itself—the same distinguishing features, and the same pathological conditions, and which are at all times amenable to the same treatment; while if that treatment changes, it is not because of any change in the disease, but solely from a change in the views entertained regarding its nature and the efficacy of the various modes of treating it.

Moreover, you state that you have no "compunctious visitations," because since 1833 "the depletory system was promptly abandoned as soon as it was found to be unsuccessful and inexpedient." May I ask have you ever found it to be unsuccessful or inexpedient? If so, please state your reasons, with a series of cases of pneumonia—say—treated without venesection prior to 1846.

If I have been curt and concise in my criticisms, it is because the vague and unsatisfactory manner in which so important a matter was dealt with demanded no more courteous treatment on my part. In a controversy such as this mere statements of opinion are of no value whatever; if facts, however, are brought forward, I promise to investigate and test their value with the utmost care.—I am, Sir, your obedient servant,

A DISBELIEVER IN CHANGE OF TYPE.

THE DIETETIC TREATMENT OF CHOLERAIC DIARRHŒA AND INFANTILE DIARRHŒA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The conflicting opinions which are published daily and weekly, as to the respective merits of the "eliminative" and "repressive" treatment of the abovenamed disorder, render it incumbent upon all who can speak from positive experience of the results of either plan, to throw the weight of their convictions into the scale on that side which their judgment commends.

That being so, I feel it my duty to state the opinion which I hold upon the subject; and I am persuaded that both science and common sense are with me, when I pronounce in favour of that which is spoken of as the "repressive," but which I prefer to name the "conservative" method of treatment.

When diarrhœa is induced by the presence of unsuitable and indigestible food, the readiest mode of cure is to get rid of the exciting cause of irritation, and this is effected by the aid of emetics or purgatives, according to the indications of the case; but when diarrhœa appears in the character of a "crisis," or determinating issue of some other disorder—such as fever—or as a premonitory symptom of cholera, another course of treatment suggests itself.

The *rationale* of the matter seems to be this: diarrhœa being the result of an effort of nature to get rid of the morbid elements with which the system is surcharged, undue interference should be avoided, either in accelerating or checking the symptom. It must be remembered that emetics and cathartics have always a depressing influence;

especially so at a time when an exhaustive process is being carried on, which involves an effort to throw off the poison from the blood by means of the diarrhœa.

This effort of nature, requires, however, to be watched and kept in check, not by chalk mixtures, or other medicinal astringents, but simply by judicious dietetic treatment. Among some of the most efficacious articles of diet for that purpose I would mention the following: good beef-tea with rice boiled in it; gruel containing brandy; port wine mulled, and ground rice well boiled; cinnamon may be added with advantage to any food or drink to which the flavour is suitable.

The value of these articles of diet is this, they combine the *astringent* with the *nutritive* properties—a most essential consideration in the treatment of diarrhœa; for it seems rational to suppose the best method by which the poison can be driven out, is to supply the blood, through the stomach, with new and wholesome elements.

We can understand that this treatment is eminently "conservative," inasmuch as it economises the life powers: and the system is thus enabled to throw of the disease without the amount of sacrifice to health and strength which the eliminative process demands of it.

I cannot close these remarks without some reference to "infantile diarrhœa," a disorder which, apart from any choleraic visitation, is always most destructive of infant life during the summer months. The Registrar-General's return for one week (at the commencement of August) showed that "of 349 deaths from diarrhœa, 309 were those of children under 5 years of age, including 244 infants." One of the saddest experiences of the sanitary philanthropist is the fact that this excessive infant mortality is in a great degree preventible; but that reflection has its hopeful side also. If we can but apply the right means of prevention, the mortality from this cause may be reduced, and, what is more, a large amount of sickness—which is always associated with, and over and above, a high death-rate—may be avoided.

If poverty were the chief cause of this fatality amongst children of the labouring population, the remedy would not be so simple; but it appears to me that ignorance is a far more prolific source of the majority of infant deaths than any other which it is possible to suggest. If we can disseminate information respecting the simple laws of health, a great step will be gained towards remedying the evil. On the subject of infant-feeding, poor parents are lamentably ignorant; and injudicious food is poison to the infant constitution, predisposing it to various ailments, which, if they do not always prove fatal, sow the seeds of ill health and infirmity for a lifetime. Considering how simple and inexpensive is the proper food for infants, there is really no reason why every child in the land should not be WELL FED, in the true sense of that term. With regard to the special subject in hand, viz., "diarrhœa and its dietetic treatment," a most valuable food would be found in ground rice: if well boiled, and a little good milk added, it would form a very nourishing diet, at infinitely less cost than the food which is daily consumed of a most injurious kind by the children of the poor.

As a charitable investment, I would recommend the laying in of stores of rice by boards of guardians, and by benevolent individuals who may delight in acts of private charity.

I believe that a hundred-weight of rice can be obtained at a cost of ten shillings; and, considering that a pound of the ground article would be sufficient to feed daily a dozen children, a very simple calculation will suffice to prove the "economy" of the plan, in more senses than one.—I am, Sir, yours, obediently,

M. A. B.

Sept. 21, 1886.

FEEES FOR ATTENDANCE ON THE FAMILIES OF MEDICAL MEN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As one of the medical men of Enniskillen, I must say that I never have charged a brother practitioner or his family for attendance or medicine, and I have always found my medical brethren in this town to act in the most honourable and gentlemanly manner in the same respect towards myself.

I am quite at a loss to find out who the gentleman is whom your correspondent "Medicus" has singled out. I trust that your correspondent will give me credit when I tell him that such "sharp practice" is not tolerated in this garrison town, and any of my medical brethren to whom I have spoken on the subject have felt most indignant at it. Finally, let me not be supposed to question the veracity of your correspondent.—I remain, Sir, sincerely yours,

BERNARD FITZPATRICK, Surgeon.

THE POOL DEFENCE FUND.

THE Cork Medical Protective Association calls upon the profession, and especially the Poor-law Medical Officers of Ireland, in a cause which deserves a liberal response. The circumstances are detailed in the following circular issued by the Association:—

DEAR SIR,—As the particulars of the late trial *Foley v. Poole*, may not be known to you, I beg leave to bring them to your notice, vide *Medical Times and Gazette*, page 189, of the 18th August, and THE MEDICAL PRESS AND CIRCULAR, 5th inst.

The plaintiff, a carpenter, fell from a cart on the 24th of July last year, and dislocated his shoulder. The following day, Dr. Poole, Medical Officer of the Ardmore Dispensary, visited him as a dispensary patient, reduced the dislocation, and bandaged the arm to the side. *Foley* removed the bandage during the night, moved his arm, and the dislocation recurred.

Dr. Poole visited the patient twice subsequently, and on both occasions *Foley* refused to allow Dr. Poole to reduce the dislocation. This *Foley* deposed to on oath at the trial.

The dislocation remained unreduced, and *Foley* brought an action against Dr. Poole for neglect and malpraxis. No witness was called for the defence, Mr. Justice Fitzgerald stating that there was no case to go the jury, and that "Dr. Poole left the court without the slightest stain on his professional character."

In successfully defending this action, Dr. Poole has incurred considerable expense, and, at a meeting of the Cork Medical Protective Association held on the 4th August, it was unanimously resolved, that an appeal should be made to the members of the profession for subscriptions to meet this expenditure, the amount being limited to 10s. to enable all to contribute.

This is a case the Committee of the Cork Medical Protective Association believe that will enlist the sympathy and liberality of the profession throughout Ireland, and that a considerable sum will be at once contributed.

An early reply will be esteemed a favour by
Yours very faithfully, C. ARMSTRONG, HOJ. Sec.

20, Patrick's-hill, Cork, September 12, 1866.

Dr. Poole has unfortunately experienced only what may happen to any Poor-law Officer in the discharge of his duties, and he finds himself now heavily mulcted in his own defence, and absolutely without redress. It is needless to remind our readers that Dr. Poole has discharged a double duty in defending his professional character; and his brethren should be as much urged by gratitude as by sympathy to hold him harmless. A list of the subscribers to the fund will be found in our advertising columns to day, and it will afford us pleasure to receive and forward subscriptions to the fund from our subscribers.

THE Health Committee of the Liverpool Corporation have resolved, in accordance with the recommendation of the medical officer of health, to establish mortuary chapels for the reception of those who have died from infectious diseases.

Medical News.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on Sept. 6th:—

Bloxam, John Astley, Bedford-place, Russell-square.
Gronow, Owen Tudor, Carlton Villas, Slough.
Leah, Thomas, Lock Hospital, Harrow-road.
Robinson, Robert, Avenham-place, Preston.

And the following on Sept. 13th:—

Elliston, George Sampson, Ipswich, Suffolk
Elphinstone, Robert, Oakfield House, Streatham.
Greenway, James Riley, Sandy, Bedfordshire.
Wood, William Dyson, Westgate, Wakefield.

THE TESTIMONIAL TO MR. GRIFFIN.—*The Illustrated London News* of the 15th inst. contains an engraving of the Testimonial presented to Mr. Griffin by the Poor-law Medical Officers.

POOR-LAW MEDICAL APPOINTMENT.—Dr. Kidd of Ballymena, is, we understand, one of the many candidates for the office of Poor-law Medical Inspector, soon expected to be vacant. We believe his appointment would give general satisfaction, as he is a gentleman well qualified in every respect to perform the duties required. He has had for a great number of years the medical charge of either a dispensary or union workhouse, and is considered a successful and judicious practitioner. We shall, therefore, be much gratified to learn if Dr. Kidd be the successful candidate, as we believe his appointment would be advantageous to the interests of the Poor-law Medical Service.

THE curious magnetic polarization of H.M.S. *Northumberland*, arising from her having been built north and south, has been destroyed by reversing that position and then de-magnetizing her by means of two of Grove's batteries.

Dr. JOHN BROWN, whose name will ever be associated with "Rab and his Friends," is, we regret to say, in the worst condition of health in which his friends could fear to see him.

MEDICAL DEPARTMENT.—The undermentioned officers have been promoted to the rank of Surgeon-Major, for the ability and zeal displayed by them during the late operations in New Zealand:—Staff-Surgeon Anthony Dickson Home, C.B.; Surgeon William Alexander Mackinnon, C.B., 57th Foot. The undermentioned Staff-Surgeons, having completed twenty years' full pay service, to be Surgeons-Major, under the provisions of the Royal Warrant of 3rd February:—Daniel Paterson Barry; August 7. William Lapsley; August 7. Surgeon William Tydd Harding, to be the 19th Foot, to be Staff-Surgeon, vice Exham Long Hifernan, appointed to the 19th Foot; September 14. Staff-Assistant-Surgeon Henry Titterton, M.D., to be Staff-Surgeon, vice Thomas Tarrant, M.D., appointed to the Cape Mounted Riflemen; September 14.

GENERAL Order from Friday's *Gazette*—"His Royal Highness the Field Marshal Commanding-in-Chief notifies to the Army that Her Majesty has approved the promotion of Staff-Surgeon Anthony Dickson Home, C.B., V.C., and Surgeon William Alexander Mackinnon, C.B., 57th Regiment, to the rank of Surgeon-Major, for the ability and zeal displayed by these officers during the late operations in New Zealand.—By command of his Royal Highness the Field Marshal Commanding-in Chief.—WILLIAM PAULET, Adjutant-General."

THE Academy of Sciences has been authorised to accept a legacy of 41,834 francs from the late Dr. Montagne. The interest is to be applied to the foundation of two prizes of 1500 francs, or two of 1000 francs and two of 500 francs, to be awarded annually to the authors of the best essays on cellular plants.

At the last meeting of the College of Physicians, London, it was suggested by some of the Fellows that the College should take the occasion of his being made a baronet to show some fitting token of respect for their President. The suggestion made was that of a portrait of Sir Thomas Watson to be suspended in the College, or of a lectureship to be founded in his name, or both of these.

A full-length marble statue of the late Sir Henry

Marsh has been completed by Mr. Foley for the King and Queen's College of Physicians, and will at once be placed in that institution. The same Artist is also engaged on a similar statue of Sir Dominic Corrigan, who was for several years President of the College.

Notices to Correspondents.

Dr. John Day, Victoria.—The letter is inserted.

Loncastrian.—The Irish and Scotch Schools of Medicine do not open till November.

A Poor-law Medical Officer.—The Poor-law Board does not allow any extras in the cases mentioned.

Querist.—The dose is about a third to the half of a grain, but it is apt to gripe.

Mr. J. N. shall receive a private note.

Dr. T.—The newspapers have been received.

Appointments.

LONDON.

BELLAMY, Edward, M.R.C.S., has been appointed Demonstrator of Anatomy to the Charing-cross Hospital Medical School.
BRIGHOUSE, J., M.R.C.S.E., has been appointed Surgeon to the St. Marylebone Dispensary.
FULLER, W., M.R.C.S.E., has been appointed Visiting Apothecary to St. George's Hospital, vice H. P. Fuller, M.R.C.S.E., deceased.
GREGSON, G., M.R.C.S.E., L.D.S., has been appointed Dental Surgeon to the Metropolitan Free Hospital, Devonshire-square, vice Alfred Coleman, M.R.C.S.E., L.D.S., resigned.
GRIFFITHS, R. S. P., L.R.C.P.L., M.R.C.S.E., has been appointed Apothecary to St. Mary's Hospital, in addition to the office of Resident Medical Officer.
MACKENZIE, MORELL, M.D., elected Assistant-Physician to the London Hospital.
MAXWELL, E. C., M.R.C.S.E., has been appointed Assistant House-Surgeon to the West London Hospital, Hammersmith.
READ, A. W., M.R.C.S.E., has been appointed House-Surgeon to the West London Hospital, Hammersmith.

PROVINCIAL.

BLEECK, C., F.R.C.S.E., has been appointed a Consulting Surgeon to the Warminster Cottage Hospital.
CARTER, R. B., M.R.C.S., has been appointed Resident Medical Officer to the Bath Union Hospital.
GRUBB, P., M.R.C.S.E., has been appointed an Acting Surgeon to the Warminster Cottage Hospital.
HARRIES, GWYNNE, M.D., London, has been appointed extra Medical Officer in charge of the Pembroke Dock District of the Pembroke Union.
OGLESBY, R. P., M.R.C.S.E., has been appointed Assistant Demonstrator of Anatomy to the Leeds School of Medicine.
SIMPSON, H., M.D., has been appointed Physician to the Manchester Royal Infirmary and Dispensary, vice R. F. Ainsworth, M.D., resigned.
SYKES, W. J., M.B., C.M., has been appointed House-Surgeon to the Clayton Hospital and Wakefield General Dispensary.
WRIGHT, C. J., M.R.C.S.E., has been appointed Assistant Demonstrator of Anatomy to the Leeds School of Medicine.
VIGARY, C., M.R.C.S.E., has been appointed an Acting Surgeon to the Warminster Cottage Hospital.
VIGARY, G. T., M.R.C.S.E., has been appointed a Consulting Surgeon to the Warminster Cottage Hospital.
WYLLIE, J., M.D., late Resident Physician to the Royal Infirmary, Edinburgh, has been appointed Resident Physician to the General Hospital, Birmingham, vice E. Casey, M.B., resigned.

IRELAND.

FILSON, ALEXANDER, A.B., M.D., Ch.M., Queen's University, Ireland, has been appointed Medical Officer to the Portaferry Dispensary, county Down, vice Alexander Bell Filson, M.D., &c., resigned.
MOORE, ROBERT H., F.R.C.S.I., has been appointed Dentist in Ordinary to His Excellency the Lord Lieutenant of Ireland.

SCOTLAND.

BUCHANAN, S., M.D., has been appointed a District Surgeon, Glasgow, vice Ferguson.
DUNCAN, J., M.D., has been appointed Medical Officer to the Scottish Provident Institution, Edinburgh, vice his father, J. Duncan, M.D., deceased.
INNES, J., L.F.P. & S.Glas., has been appointed Police Surgeon for the St. Rollox District, Glasgow, vice H. Rae, L.F.P. & S.Glas., deceased.
MCKENZIE, W. S., L.R.C.P. Ed., L.F.P. & S.Glas., has been appointed Medical Officer for the Parish of Dalsfer, Lanarkshire.

INDIAN ARMY.

ADEY, A. W. G., Assistant-Surgeon, to be Surgeon Bombay Army.
BAILLIE, G., M.D., Surgeon, to be Surgeon-Major Madras Army.
BAILLIE, H., M.D., Surgeon, to be Surgeon-Major Bengal Army.
BRUCE, L. S., Assistant-Surgeon, to be Surgeon Bombay Army.
FLEMING, J. B., M.D., Surgeon, to be Surgeon-Major Madras Army.
MCDONALD, D., M.D., Surgeon, to be Surgeon-Major Bengal Army.
MACKENZIE, D., Surgeon, to be Surgeon-Major Madras Army.
SHAW, H. T., Assistant-Surgeon, to Surgeon Madras Army.
SYLVESTER, C. J., Surgeon, to be Surgeon-Major Bombay Army.

ROYAL NAVY.

BEAMISH, Richard, Esq., Acting Assistant-Surgeon (additional), to the *Victory*.
CROWDY, Alfred S., Esq., Acting Assistant-Surgeon, to the *Royal Adelaide*.
WILSON, Thomas G., Esq., Surgeon, to the *Basilisk*.

POOR-LAW.

Amminster Union.—John S. Snook, M.R.C.S.Eng., L.S.A., to the Shute District.
Croydon Union.—Robert Warren, L.F.P. & S.Glas., L.M., L.S.A., to the Fifth District.
Dartford Union.—William P. Fisher, M.R.C.S.E., L.S.A., to the Workhouse.
Fulham Union.—Francis Egan, L.K.Q.C.P.L., L.S.A., L.M., to the First District.
Luton Union.—Charles C. Hicks, M.D. St. And., M.R.C.S.E., L.S.A., to the Dunstable District.
Bootle Union.—Henry W. Bromley, M.R.C.S.E., L.S.A., to the Raven-glass District.
Selby Union.—James F. Milner, M.R.C.S.E., L.S.A., to the Cawood and part of the Riccall District.
Yeovil Union.—Walter A. Harvey, L.R.C.P.Lond., M.R.C.S.Eng., to the Fifth District.

BOOKS RECEIVED.

Climate and Phthisis. By F. H. Rose, M.R.C.S.E. London: Wm. Freeman.

Medical Diary of the Week.

OPERATION DAYS AT THE LONDON HOSPITALS.

WEDNESDAY.—University College Hospital, 2 p.m.; St. Mary's, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's 1½ p.m.
THURSDAY.—St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Surgical Home, 2 p.m.; Royal London Orthopaedic Hospital, 2 p.m.; West London Hospital, 2 p.m.
FRIDAY.—Westminster Ophthalmic, 1½ p.m.; Boyal London Ophthalmic, 10½ a.m.
SATURDAY.—St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's College, 2 p.m.; Charing-cross, 2 p.m.; Royal Free Hospital, 1½ p.m.
MONDAY.—Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 9 a.m. and 1'30 p.m.; Royal London Ophthalmic, 10½ a.m.
TUESDAY.—Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopaedic, Great Portland-street, 2 p.m.; Royal London Ophthalmic, 2 p.m.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

On the 14th inst., at 15, Sidney-street, Cambridge, the wife of P. W. Latham, M.D., of a daughter.
 On the 17th inst., at Cobham, Surrey, the wife of Rowland Smith, M.R.C.S.E., of a daughter.
 On the 5th inst., at Brighton, the wife of J. N. Winter, M.R.C.S.E., of a daughter.
 On the 12th inst., at Hemel Hempstead, the wife of E. H. Ambler, F.R.C.S.E., of a daughter.
 On the 2nd inst., the wife of R. W. Graves, M.R.C.S.E., of Gloucester, of a son.
 At Church Gresley, Derby, Ellen, wife of Wm. Carrick Crofts, M.R.C.S., of a son.
 On the 9th inst., at 14, Albion-street, Hull, the wife of M. Craven, M.R.C.S.E., of a daughter.
 On the 7th inst., at the Curragh, the wife of Dr. J. O. Cunningham, 60th Royal Rifles, of a son.

MARRIAGES.

On the 6th inst., at St. Jude's Church, Southsea, William Francis Noot, M.D., to Mary Margaret, only child of the Rev. F. Murray Patten.
 On the 5th inst., at the Chapel of the Charterhouse, John Nottingham, M.D., of Liverpool, to Sarah, youngest daughter of the late Stephen S. Worthington, Esq., of Liverpool.
 On the 5th inst., at Stonehouse, Devon, T. Tarrant, M.D., Surgeon, Cape Mounted Rifles, to Ellen Christina, second daughter of the Rev. W. H. Nantes, Vicar of Stonehouse.
 On the 5th inst., at the Parish Church, Llysfafn, Carnarvonshire, Arthur Croker, Staff Assistant-Surgeon, to Frances, third daughter of Henry Smith, Esq., of Adelaide-road.

DEATHS.

On the 18th inst., at Baker-street, Portman-square, London, Dr. J. Skey, late Physician to the Forces, and Inspector-General of Army Hospitals, aged 94.
 On the 24th inst., at Gateshead, F. Bennett, M.R.C.S.E., aged 59.
 On the 29th inst., at Bath, Peter Smith, M.D. (Pennsylvania), aged 48.
 On the 15th inst., at Gateshead, George S. Thompson, M.R.C.S.E., aged 28.
 On September 20th, at 52, Fitzwilliam-square, of inflammation of the lungs, Anna Maria, the beloved wife of Philip Bevan, Esq., Surgeon, M.D.
 On September 21st, at 129, Lower Baggot-street, Wm. Cronin Horgan, Esq., M.D., of diarrhoea.
 On the 9th inst., at Church Gresley, Derby, Leonard Cecil, infant son of Wm. Carrick and Ellen Crofts.

The London Hospital Medical College.

The next WINTER SESSION will commence on Monday, October 1st, 1866, when the Introductory Lecture will be delivered by Dr. HEAD, at 3 p.m.
 General fee to Lectures and Hospital Practice, 84 guineas, payable in two instalments of 42 guineas each, at the commencement of the first two Winter Sessions of attendance.
 Perpetual fee to the Lectures alone, £50. Library fee, 1 guinea.
 Students can make special entries to Lectures or Hospital Practice.

MEDICAL OFFICERS.

Consulting-Surgeon—Mr. Luke.
 Physicians—Dr. Fraser, Dr. Davies, Dr. Clark.
 Surgeons—Mr. Adams, Mr. Curling, Mr. Hutchinson.
 Assistant-Physicians—Dr. Ramskill, Dr. Down, Dr. Hughlings Jackson, Dr. Morell Mackenzie.
 Assistant-Surgeons—Mr. Maunder, Mr. Couper, Mr. Little, Mr. Rivington.
 Obstetric Physician—Dr. Head.
 Assistant Obstetric Physician—Dr. Palfrey.
 Dental Surgeon—Mr. Barrett.

LECTURES AT THE LONDON HOSPITAL MEDICAL AND SURGICAL COLLEGE.

Medicine—Dr. Herbert Davies, Dr. Andrew Clark, and Dr. Ramskill.
 Surgery—Mr. Hutchinson.
 Descriptive and Surgical Anatomy—Mr. Adams and Mr. Rivington.
 Physiology, General and Morbid Anatomy, and Practical Histology—Mr. Couper and Dr. Hughlings Jackson.
 Practical Anatomy—Mr. Rivington, Mr. Jas. Adams, and Mr. Tay.
 Chemistry and Practical Chemistry—Dr. Letheby.
 Anatomy and Pathology of the Teeth and Dental Surgery—Mr. Barrett.
 Midwifery and Diseases of Women and Children—Dr. Ramsbotham.
 Forensic Medicine—Dr. Ramsbotham and Mr. Rodgers.
 Materia Medica and General Therapeutics—Dr. Down.
 Ophthalmic Surgery—Mr. Hutchinson.
 Botany—Dr. Dresser.
 Comparative Anatomy—Mr. Rivington.
 Special Operative Surgery—Mr. Maunders.
 The London Hospital contains 445 beds, and receives an average of more than 4000 in-patients annually.
 The Appointments of Dresser, House-Surgeon, Resident Medical Officer, Assistant Medical Officer, Resident Obstetric Assistant, &c. &c., are open to the students without further fee, and include residence and partial board.
 Two Scholarships and Two Gold Medals will be awarded by competition during the ensuing Session.
 Further particulars can be had on application to Mr. Hutchinson, Hon Loc. Sec., 4, Finsbury-circus, E.C., or at the College.
 Mile-end, August 23, 1866.

Westminster Medical Hospital School.

INTRODUCTORY Lecture on October 1, at 8 p.m., by Dr. FINCHAM.
 The entire course of study (including Hospital Practice and Lectures) required by the College of Physicians, College of Surgeons, and Society of Apothecaries, may be attended on payment of 75 Guineas, which may be paid by instalments spread over three years. Perpetual Entry, 80 Guineas.
 The offices of Resident House-physician, Resident House-surgeon, Assistant House-surgeon, Clinical Clerk, and Dresser, are conferred on Pupils of the School without fee.
 For Prospectuses of the Courses, &c., apply to the Lecturers and Medical Officers, or to Henry Power, Dean of the School.

Royal College of Surgeons in Ireland.

SCHOOL OF SURGERY.—SESSION 1866-67.
 Anatomy and Physiology—Dr. Jacob.
 Descriptive Anatomy—Dr. Bevan and Mr. Morgan.
 Surgery—Mr. Hargrave and Dr. J. S. Hughes.
 Practice of Medicine—Dr. Benson.
 Chemistry—Dr. Barker.
 Materia Medica—Mr. Macnamara.
 Midwifery—Dr. Sawyer.
 Medical Jurisprudence—Dr. Geoghegan.
 Practical Chemistry—Dr. Barker.
 Comparative Anatomy—Dr. Jacob.
 Botany—Dr. Mitchell.
 Hygiene—Dr. Mapother.
 Dissections under the direction of the Professors of Anatomy and the Demonstrators, Drs Croly and Stoney and Mr. McAllister.
 By order, JOHN BRENNEN, Registrar.

Cow-Pock Institution, 45, Upper Sackville-Street, DUBLIN (1804).

Patron—His Excellency the Lord Lieutenant.
 Secretary—Henry L. Dwyer, M.D.
 Assistant-Secretaries—Edward B. Sinclair, M.D.; George Montgomery, M.D.
 Children of the poor brought to the institution, 45, Upper Sackville-street, on Tuesdays and Fridays, between 11 and 2 o'clock, or to the Southern Branch, 45, York-street, on Mondays and Thursdays, to 35, New-row, West, or 22, Penix-street, on Wednesdays, to 22, Wentworth-place, or 53, Sheriff-street, on Saturdays, between 10 and 12 o'clock, are vaccinated gratis. Packets of infection, which may be transmitted by post, half-a-crown each. Practitioners and Dispensaries supplied for half a guinea per annum, and Union Workhouses, on the application of the respective clerks, supplied for one guinea per annum each. Surgeons of the Army supplied on application to the Army Medical Office, Dublin. Applications for Lymph, and communications prepaid, are to be addressed to the Secretary, 45, Upper Sackville-street Dublin.

Hospital for Diseases of the Skin, BLACKFRIARS.

Out-Patients are seen on
 Mondays, at Three o'clock.
 Tuesdays Two
 Wednesdays Three
 Thursdays Three
 Fridays Two
 Students are admitted to the Practice, for Three Months, £3 3s.; Perpetual Attendance, £5 5s.
 GEORGE BURT, F.R.C.S., Hon. Sec.
 ALFRED S. RICHARDS, Secretary.

 JOLLIFFE TUFNELL, F.R.C.S.
 H. G. CROLY, F.R.C.S.
 Consulting Physicians.
 Professor APJOHN and C. P. CROKER, M.D.
 Assistant Ophthalmic Surgeon.
 ARCHIBALD H. JACOB, M.D., F.R.C.S.
 Dental Surgeon.
 FRANCIS McCLEAN, Esq., Jun.
 For further particulars apply to Dr. Benson, 42, Fitzwilliam-square, West, between One and Two o'clock.

THE QUEEN'S UNIVERSITY IN IRELAND.

QUEEN'S COLLEGE, GALWAY.

The College Session will Open on TUESDAY, the 16th October, when the Supplemental Examinations will commence.

The Examinations for Junior Scholarships will begin on THURSDAY, the 18th October, when the following Scholarships will be offered for competition:—

FACULTY OF ARTS.

THIRD YEAR—One Literary Scholarship—Value, £24.
 SECOND YEAR—Five Literary and five Science Scholarships of the annual value of £24 each, and tenable for two years.
 FIRST YEAR—Five Literary and five Science Scholarships of the value of £24 each.

FACULTY OF MEDICINE.

Eight Scholarships of the value of £25 each—two to students of the First, Second, Third, and Fourth Years respectively.

DEPARTMENT OF ENGINEERING.

Two Scholarships to students of the First, Two to students of the Second, and One to students of the Third Year; all of the value of £20 each.
 The Examination for SENIOR SCHOLARSHIPS and for LAW SCHOLARSHIPS will be held at the usual time in December.
 Junior Scholars are exempted from payment of one moiety of the class fees in their respective faculties.
 The Lectures and Courses of instruction in the ordinary classes embrace the subjects required from Candidates at the public examinations.
 The MATRICULATION EXAMINATION will be held on FRIDAY, the 19th October.

Further information may be obtained from the Registrar.
 By order of the President,
 WILLIAM LUPTON, M.A., Registrar.
 Queen's College, Galway,
 20th September, 1866.

King and Queen's College of Physicians IN IRELAND.

NOTICE TO MEDICAL STUDENTS.

PRELIMINARY EXAMINATION IN ARTS.

The First Preliminary Examination in Arts, for the Session 1866-67, will be held at the College, on Saturday, the 13th October, at Twelve o'clock.
 Students intending to present themselves for Examination can obtain information, as to the subjects of Examination, at the College, in Kildare-street.
 LOMBE ATTHILL, M.D., Fellow and Registrar.

THE MEDICAL CLUB.

A Club is being formed in London for the convenience of Members of the Medical Profession, and Gentlemen engaged in the pursuit of those Sciences allied to Medicine.

The following terms of admission are applicable only to Members joining before the end of the present year—viz.: Residents within the London Postal District, Five Guineas Entrance, and Three Guineas Annual Subscription; those beyond the London Postal District, Three Guineas Entrance; Annual Subscription, One Guinea. Entrances and Subscriptions to be paid to the Bankers of the Club, The London and Westminster, 1, St. James's-square, S.W.
 JOHN PROBERT, Esq., Treasurer.
 6, New Cavendish-street, W.
 LORY MARSH, M.D., Honorary Secretary,
 Royal United Service Institution, Whitehall-yard, S.W.
 September, 1866.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

OPENING OF THE ENGLISH MEDICAL SCHOOLS.

THE Medical Session in England opens on the 1st of October, and at each School it has long been the custom for one of the teachers to deliver an Inaugural Address on the occasion. In some cases of late years gentlemen not officially connected with the institutions have undertaken this duty, but it has usually been entrusted to one of the staff. The custom affords an excellent opportunity for exhortations, which cannot be so appropriately introduced at any other point of the students' career, and retains considerable interest for the old pupils of the school, who, so long as they possess the opportunity, make it a time of reunion of old friends and fellow workers:—

LONDON.	
Hospitals and Schools.	Lecturers.
St. BARTHOLOMEW'S	Mr. SAVORY, F.R.S.
CHARING-CROSS	Mr. BARWELL.

MANCHESTER	Dr. BROWNE.
NEWCASTLE	Dr. GIBB.
SHEFFIELD	Dr. AVELING.

The Scotch and Irish Schools do not open until November, and their arrangements are at present not complete.

EXTRACTS FROM
INTRODUCTORY ADDRESS
 AT
ST. BARTHOLOMEW'S HOSPITAL.
 By **WILLIAM S. SAVORY, F.R.S.**

WHATEVER position Medicine is entitled to hold amongst the sciences, this is certain—it is not an exact science. It is concerned with probable truths.

Our business is to minister to the cure of disease—to the repair of injury, and so to prolong life, and to render it as useful and as agreeable as possible—to prevent, or remove, or mitigate the ills that flesh is heir to. We are, therefore, immediately concerned with the nature and treatment of disease.

But the nature of disease, for the most part, is often, during life, and sometimes after death, doubtful. The diagnosis of a particular case or the determination of the disease which exists is very often only more or less probable. Indeed it perhaps seldom happens that one can be absolutely certain beforehand, beyond all doubt or question, of the nature of the disease which actually exists, although we may, in the great majority of cases, from the weight of

probable evidence, make our diagnosis a moral certainty, and therefore amply sufficient for our practical purposes.

So the treatment of disease is, for the most part, doubtful, for the remedies we employ are in their action more or less uncertain. Some are very equivocal, others almost sure. But on the whole, when skilfully prescribed, it is highly probable that many of them will act in the way anticipated.

I cannot think less of medicine as a study, because it is not an exact science. On the contrary, if it were, it would, for me at least, lose much of its present interest. We are very often told that medicine is, at the best, an uncertain science, obscure in its principles, and doubtful in its practice. Difficult enough we know, but is the reproach of its difficulties to fall on those who have to grapple with them? Uncertain! Granted that, for the most part, we have to do with probabilities only—nay, sometimes, it may be with mere conjecture. But who does not, every day of his life, depend on probabilities and act upon conjecture? Probability, as Butler says, is the very guide of life. In medicine, as in the daily occurrences of life, probabilities vary from moral certainties to possible contingencies.

It seems hardly reasonable when for disease or pain the aid of medicine is sought to complain that the means employed for relief or cure are rather uncertain in their action or somewhat doubtfully selected, that, after all, recovery cannot be secured, but is, by the aid of medicine, only rendered highly, or at least more probable, than before. I say it seems hardly reasonable to urge this objection when every day, and all day long, we stake our very lives—nay, what we cherish more and hold dearer than our lives, upon probabilities; when the most important issues in the world are fearlessly and complacently based upon probabilities. But it may be said that the question of probabilities is a very wide one, from almost absolute certainties to the merest chance. But in this regard I contend that the art of medicine, in the hands of a skilful practitioner, stands well; and, moreover, while unfortunately it often happens that the prospect of being able to do much good is very doubtful, it fortunately very seldom happens that we need run much risk of doing mischief.

Amongst many considerations arising out of this, it may be remarked that it is because medicine is not an exact science, that the man of observation and experience in the practice of his art has so enormous an advantage over others, and why it is that he knows so much more than he can teach; for although he cannot arrange his knowledge into aphorisms, or induce general principles from his collection of facts, he can apply it with skill to the investigation and conduct of individual cases. He has learned how to hit—he can only teach you how to aim. Professional skill cannot be transmitted from one to another. It can be gained only in one way and in one place—by work at the bedside.

Out of the nature of the science and art with which we have to do arises this, that our work in it can never become a matter of mere routine. The relation between cause and effect is oftentimes so indefinite, the disturbing influences which intervene are so numerous and various, that each case becomes a study in itself. It has been said of injuries and of certain diseases that they are especially interesting because no two cases are exactly alike. But this may be said most truly of all diseases. No two are ever precisely alike. Groups of diseases, like leaves on a tree, are connected closely by strong family features, but, like leaves, each individual case has peculiarities of its own which mark it from every other. Nature seems to avoid mere repetition in her modes of action as in her creations, and you will find, if you look far enough, that diseases will vary as your patients' faces. There is, therefore, something to learn from every case if you will only seek for it. You have not done enough when you have determined its nature and treatment. Look farther still and see what else can be made out of it. When a man ceases to be a student of his profession the sooner he ceases to practise it the better. I do not mean for a moment to imply that the in-

investigation and management of every case is equally different, still less that one's previous experience should go for little or nothing. On the contrary, here, as much as anywhere, practice and practice only can make perfect. But what I would warn you against, no matter what your ability, accomplishments, or skill may be, is this, carelessness by the bedside of a patient. Make it a rule, to be broken as seldom as possible, for in spite of all your resolution it will be broken too often; but make it a rule either to examine a case thoroughly or to leave it alone entirely. Get into the habit of making each case while actually before you of paramount importance. Haste or hurry, or the suspicion of indifference, is an insult to your patient, and an offence against the profession. We can never have an excuse for doing less than our very best.

In conclusion, students were reminded of the obligations by which they were bound, and exhorted to render themselves worthy of the profession they had chosen.

ABSTRACT OF THE
INTRODUCTORY LECTURE,

DELIVERED AT
CHARING-CROSS HOSPITAL MEDICAL SCHOOL,
ON THE 1st OCTOBER, 1866.

By RICHARD BARWELL, F.R.C.S.,

ASSISTANT SURGEON AND LECTURER ON ANATOMY AT THE ABOVE SCHOOL.

GENTLEMEN,—We, your teachers, come together on this first of October to meet old and new pupils upon whom in the next few years we have to impress our knowledge, and the results of our experience, whom we hope to influence for their good, and who in sending them out to use that knowledge, we shall hope to see prosperous and happy.

This, the inner meaning of a meeting like the present, is not new to you; but can interest be only excited by something new? It has always seemed to me that the preacher who said that "All is vanity, there is no new thing under the sun," was speaking not as the wise king, but as the worn-out old debauchee, whose wives and concubines had been rather too much for him. The man who duly considers the meaning of his life as part of a vast mass of human existence and work—reaching back to eras before history began—will not be able to regard it as vain and empty; partly because in this present he has his sole grasp of eternity, partly because each man's life and labour is not his own merely, but part of a great commonwealth.

Having inherited the result of other men's labour let him leave something worthy behind him. This idea may be carried out further; for whether man really was descended from "several" monkeys (as Dr. Hunt asserted at Cambridge), may be doubtful; but it is quite certain that he was originally a very different creature to what he is now; according to Swift, "a forked radish with a head fantastically carved." He was a skulking thin-shanked creature, living in holes and woods with cave-bears and hyenas, whom he sometimes ate and who sometimes ate him. This latter event happened so unfortunately often, that he contrived convenient and portable weapons of defence. From this act originates all our elaborate civilization—yet countless ages have passed in its development. All the oceans of the earth do not contain so many drops of water as lives have passed in preparing for us this present social state. The commencement must have been very slow, but the impetus of improvement grew gradually more rapid, so that in the beginning of the historic period, we find several peoples dwelling at the eastern parts of the Mediterranean and Black Sea, possessed of singular and remarkable culture in such arts as poetry, sculpture, architecture, &c.

After a number of centuries these peoples, thoroughly corrupted, are overwhelmed in a deluge of new nations, so barbarous that the arts of their forerunners are lost and

forgotten, or nearly so; until the fashion of studying the ancient writers again revived intellectual development in Europe. Observe, however, that this pristine culture of Greeks and Romans, &c., and the subsequent progress of the *renaissance* period, is to be measured and estimated by the perfection of arts.—Science—that is to say, the study and knowledge of Nature's powers, did not exist even in a rudimentary form. Wild speculation and imaginary guess work reigned in all departments of such study, until Verulam, of whom our country may be justly proud, laid in his "Novum Organum" the first foundation of scientific method and inquiry.

The age in which we live is preëminently scientific, that peculiar logical and direct mode of thought characteristic of Bacon's method, having diffused itself among people whose vocation mixes them in no way with science. All the mechanical arts are imbued with this same quality, so that the inventions of the age are not simply isolated cases, mere flukes of discovery, but are long chains of solved problems, terminating in some valuable result. There has never been a time when the atmosphere of society was so genial to scientific pursuits; but while the age gives us this preëminence, it also imposes on us heavy duties; for as thousands of lives have passed in preparing this condition for us, so must we not let our lives pass without increasing the store or others, not necessarily by discovery or invention, but at least by earnest love of truth and hatred, destruction of falsehood.

The latter part of this doctrine is not so easy as it at first appears. Medicine is not so much a science as a science of sciences, many of which are in an imperfect state; many of them, like electricity, chemistry, and certain parts of physiology, have been brought somewhat to the attention of the leisurely and pleasure-seeking portion of the public. There is in all lands, and certainly in England, a class of hangers-on of science, whose occupations forbid them to pursue such knowledge; who love to hear the marvels of nature, and to believe that they know something of abstruse things. From this class of people originates such a wave of pseudo-science as has passed over us the last twenty years, and is now declining. The fashion begins very easily and harmlessly. Perhaps there may be an eminent lecturer, whose diction is so simple that his hearers really think they understand him; on his evenings the public lecture-room is crowded; he explains with extreme simplicity of language the most advanced theorems in dynamics and electricity, while a well-dressed audience takes graceful notes, such as would, I am sure, astound the lecturer. He accompanies his teaching with experiments, that although, to perform truly, require the most exact machines and hands as delicate as a Faraday's, are repeated and excelled in the schoolroom with an old staylace and a lollipop. But soon such things get dull, for the details of science are apt to be slow. Mesmerism, clairvoyance, electro-biology, succeed each other, and as each experimenter outbids his fellows in the marvellous, so public appetite is stimulated even to the swallowing of spiritualism and table-rapping. A mind greedy of the marvellous will scarcely check at anything, but the limits of absurdity have probably been reached with the idea that disembodied spirits should delight themselves in the company of two mountebanks, tied up in a cupboard, by playing "Sally come up," and other graceless melodies on a vile guitar and a wheezy accordion.

Such are the results which the flashy genius of pseudo-science wins; aspirations too grand, too æsthetic to follow the simple lead of truth, which must claim a world beyond the limits of mere reason, culminate in a pitiful juggling with ropes and banjos, or in tapping on tables at 10s. 6d. per hour. In the meantime, men whose names were never whispered in the "at homes" and "small and earlies" of the season, have nearly demonstrated the oneness of all force, have made the lightning our despatch-postman, and have laid a path for intelligence "under the roots of the ocean."

The moral of this history is not far from us. Medicine,

as I have already said, is a science of sciences; we gather from many stores the knowledge which is to be the basis of our work, but the application of this science is an art. It is one thing to have at our fingers' ends all possible learning about diseases, and another to perceive what is the matter with a patient—a third to prescribe in such a way as shall counteract the disease, and suit the idiosyncrasy, and it is a fourth to get fairly and properly paid for our work—and sometimes, I assure you, this is the most difficult of all the four. Successful and righteous practice of our profession requires then a somewhat rare combination of qualities. Power of steady work, and close reasoning, rapid and sure perceptiveness, quickness and plenty of resource, decision yet tenderness of character and great tact combined with the purest honesty.

Upon this latter union we must dwell for a few minutes, for tact is a quality which the medical man ought largely to possess; yet such possession offers at times the greatest temptation to insincerity, untruthfulness, in fact to humbug. He who has the wisdom of the serpent, must take care lest he use it like a serpent.

Unfortunately the confines of medical and surgical practice are haunted by hosts of this sort of unreality, in many ways comparable to the rope-twisting and table-turning juggles above mentioned. The public can know nothing of our abstruse and difficult science, but it is constantly in contact with the art, and having no basis for criticism is apt to be led away rather by what appears wonderful, than influenced by sterling truth. There are always men ready to take advantage of such phase of the public mind, men possessed generally of considerable tact, knowledge of the world, power of pushing, and very little burdened with scruples: from such arise those advertising museums which are only false baits wherewith their traps are set—also homœopathic, mesmeric, and such like hospitals. But these individuals are not all extra-professional; there are many degrees of a long ladder, from the hand-bill-distributing quack, upwards, whence originate all sorts of irregular practice, curious special hospitals and sundry marvellous establishments.

It must not be understood that all special hospitals are to be condemned, since such institutions as a fever or eye hospital, children's hospital, and a consumption hospital, and a few others, are even laudable, but on the other hand most institutions for the treatment of a special disease, *par excellence*, of any special surgical disease, and emphatically for the administration of one selected remedy, must be wrong in principle and effect; for in the first place, those who set them up, are for the most part men who do so only to connect their names with certain maladies, and secondly, when hospitals are established for diseases of the stomach, of the kidneys, of the bladder, of cancer, of fistula, &c., the public must diagnose its own diseases, before going to the hospital: moreover, when institutions are established to exhibit a certain agent, the patient must not only decide on his own disease, but prescribe his own remedy. Nevertheless if we were to judge the value of these places by the number of patients professed to be treated in them, we might form a most brilliant idea of their flourishing state; but there is this curious fact, that the amount of patients advertised as treated in the course of a month, probably exceed or at least equal the quantity of persons afflicted with the malady in the whole year.

Glitter, though not golden, may attract a good deal of the metal; but although it is your aim to become successful practitioners, yet that higher aim of paying the debt with its accumulating interest which we owe to posterity, must not be forgotten. Let us not forget that *Truth*, scientific and moral truth, is the store whose amount and value we are to increase, not merely by adding more facts, but chiefly by combating falsehood and error—the base alloy, the foul mixture, which sullies the good metal and sadly depreciates what it does not tarnish.

I must, though unwilling to make any boast, allude to what has been added in this hospital to our general store of knowledge. Nearly all the Professors have worked

with more or less success in this direction, and a good deal, emanating from the studies of disease here, has made its impress on the world. Now, however, I speak especially of an operation on the foot, devised by the Professor of Surgery at the College of Surgeons, who, I am glad to say, is also Professor of Surgery in this School, which operation has resulted in so excellent a manner that it will, doubtless, be considered one of the great surgical improvements of our age.

We are not all, however, to invent or run after novelties. Most of what is old is also good, and you, Gentlemen, will have to begin with what is already known. A glance at the prospectus will show you that your time and memory will be fully taxed. I will only say that to work well, you must divide your time fairly. When you study do it with all your might; when you play amuse yourselves with your whole energy, neither work nor play are worth anything if they be mixed together.

I must now speak of changes in the Hospital Staff and School. We have to regret the loss of a good colleague and teacher in Dr. Milshire, who has departed for Italy. We must regret him, but with a modified sorrow, as one gone to another and better place; at least let us hope he will like it better. Moreover, we can afford but a moderate sorrow, since his place is so amply, perhaps more than filled, by the full complement of assistant-physicians elected into the vacancy. In Dr. Salter's hands, the medical lectures we know are fully safe, while the Physiological Lectureship will receive perfect justice from the hands of Dr. Morris Tongue. Dr. Pollock and Dr. Parsons will respectively teach pathological anatomy and midwifery and in them we welcome good colleagues about to become good friends.

Mr. Hancock has yielded half the Surgical Chair to Mr. Canton, whereby you will have the advantage of hearing the theoretical and seeing the practical teaching of both surgeons.

In consequence of the last change the Chair of Anatomy devolves upon me. I shall do my best to fill it worthily, and to lecture on that subject thoroughly and well; at all events, if you work as hard to learn your anatomy, as I, together with our Demonstrator, Mr. Bellamy, shall do to teach it you, we shall send an uncommonly good lot of students to the College examinations.

As, then, I shall so soon have the pleasure of meeting most of you again, not only as heretofore in practical surgical, but in the anatomical teaching also, I do not now take my leave of you, but simply say to you: "*Au revoir*."

LONDON HOSPITAL.

INTRODUCTORY LECTURE.

By Dr. HEAD.

GENTLEMEN,—I believe that very few indeed who have preceded me in the occupation of this Chair on similar occasions to the present, have not expressed their sense of the inadequacy of their powers to discharge the important duty which they had undertaken with satisfaction to themselves or with interest and improvement to their hearers. I confess, for my part, that I fully sympathise with them, and that if I had any idea of the difficulty of the undertaking, should have longer hesitated when I was requested to do so by the kind courtesy of the Council of this College. This difficulty arises from several causes. In the first place, it has been the custom for many years to open the Annual Session of all the Medical Schools with an Inaugural Address, and so many of the greatest minds of our profession have exerted their powers in discharging the office, that one naturally feels somewhat depressed by the idea of being again called to do what has been already done so often and so well.

Another difficulty is the comprehensiveness of the matter brought under review, and the consequent considerable

share of knowledge, abilities, and leisure required to write anything inaugural on such a subject.

I, therefore, propose to devote the time that custom allows on occasions such as the present to the giving such useful advice to the students commencing their labours as may occur to my mind, to mention the special dangers that beset their career, and the manner of pursuing their studies to the best advantage—the true object and aim of medical and professional life.

But before I proceed to this, which will be to me both a duty and a pleasure, and I hope not an uninteresting half hour to yourselves, I must be permitted to give myself the very great pleasure on this, the eighty-second Anniversary of our foundation, to bid you the heartiest welcome, first to those renewing their studies, and then, and more especially, to those who come for the first time among us, to assure you all of the very warm interest we take in your welfare and success, and the anxiety we shall always feel to promote the interests of all diligent and faithful students to the best of our power through the whole of their future career.

Let us hope now, being members of the same College, attached to the same Hospital, students of the same Science, having similar difficulties, similar ends, that we may always regard each other as brethren in the same noble vocation, and let our only object of rivalry be how we can best subserve the common interest of our profession, how maintain the credit of the College and Hospital with which it is our honour to be attached.

I have mentioned our noble Hospital and College. Well, Gentlemen, this is another topic that most of my predecessors have touched on, and well indeed they may be pardoned some reiteration of the subject, for surely no grander institution on the whole exists in this metropolis, none that affords more extensive generous relief, certainly none that affords vaster opportunities for prosecuting his studies to the student.

Let me, then, for a few moments follow the routine observed on those occasions, and furnish some information which may be specially interesting to our younger brethren concerning the noble foundation they have so lately become members of—the Alma Mater of their professional lives.

It may be supposed that the medical schools, like similar institutions in Arts and Theology, have been in existence many generations. This, however, is not the case. Eighty years since they were not in existence. Particular men gave special courses of lectures, indeed, at one or two of the more prominent hospitals, but even this can hardly be dated back for more than a century. Of such lecturers may be mentioned Cheselden at St. Thomas's; Pott at St. Bartholomew's; and subsequently, Blizard and Maunder at our own Hospital.

Their efforts were supplemented, to a great extent, by private schools, the most famous of which was that maintained by John Hunter and his no less able but less famous brother William.

But this system, however good in such hands, was in itself radically bad; it was private, self-appointed, desultory; it was impossible under it to supply the wants of the country, the army, and navy with a body of well-educated efficient medical men.

The London Hospital may be always proud that the commencement of a better, perhaps the best possible, system was made by one of her own body. We, Gentlemen, as well as the profession at large, must always pronounce with reverence the name of Sir W. Blizard. It was by the energy and assiduity of this celebrated surgeon that the first medical school was established capable of giving the student a complete medical training, and that medical school the Medical School in which we are now assembled.

The example, then, set by our own Hospital was speedily followed by others, and thus the London Hospital has the very great credit of inaugurating this beneficial revolution in the system of medical education, and indeed it may claim similar credit in other important improvements; for

instance, the practice of giving clinical lectures was first commenced in this place; and not only has the London Hospital been the Corypheus of medical education in time past, it still remains amongst the first institutions at which an accurate, practical, and extensive knowledge and experience of the profession can be acquired.

Whilst speaking of our noble Hospital it is impossible to forget what a striking exemplification has been given of the effectiveness of its organization and resources—indeed, of all the facts that I have ventured to bring forward in reference to this matter, by the manner in which we have met, and by the blessing of God retarded, the westward progress of the dire cholera war which has so lately broken over us. The important services rendered by this institution at this fearful crisis were given with the utmost devotion, and I do not mention it now so much with the object of re-stating what is well known, as to express the gratitude which I am sure the authorities feel from the very generous assistance of the generous public, whose free will offerings visibly, now, as ever, maintains the correctness of the phrase "English generosity" in the world. Partiality to our own body, or rather the suspicion of being influenced by it, must not prevent my claiming a high tribute of praise to those whose duty it was at the risk of their own lives to observe and combat the symptoms of this dire disease. To the resident medical officers of this Hospital, for their untiring energy in ministering by night as well as day to the requirements of the sick.

To the House-Governor of this Hospital, a gentleman of whom I will only say this, which is indeed quite unequal to his merit, that his devotion to the Hospital, his kindly interest in the sick, his parental attachment to the pupils, demand our deepest respect and gratitude.

For the lady nurses and nurses, who all regardless of their own safety, and with a devotion rendered still more striking and self-sacrificing by the fact of their physical weakness, spent night and day in soothing the struggles and alleviating the agonies of the dying, and in discharging the last sad offices for the dead.

Praise to them who have done their part so well, not praise, however, on their own account, but in our own, that we in our turn may, if necessary, be encouraged to follow so noble an example, and that society may be elevated by the record that such deeds of self-sacrifice and devotion have been done in its midst.

Mere love of human praise indeed, could never have induced men and women to act in this manner. The praise of God and the satisfaction of their own consciences must be their own best reward. And alas, Gentlemen, if human praise were their only and sufficient reward, some who have worked and suffered with us would be for ever unpaid for their labour. Of the nurses two have succumbed to the terrible danger they dared.

Of our own ranks, also, one is departed. Dr. Ansell, in the active discharge of his duties as Medical Officer of Health of the Row District, the Chairman of the Court of Examiners of the Society of Apothecaries, and for many years the active Chairman of the Drug Committee of the London Hospital, fell a victim to this dire malady.

It may be hoped, indeed, that the attack itself is fast wearing itself out, but we cannot forget that its consequences will be long felt. How many children a month or two ago, happy under the protection of their parents, are now orphans, thrown without friends upon the world. Who, therefore, can estimate the wretchedness and misery, which must accrue in this way from the cholera, if nothing can be done to prevent it. The only way truly to meet this evil is by the subsidiary aid of orphanages. A lady, who has long taken a kindly interest in our Hospital, is, as is well known, doing her utmost to provide such means of relief for the children of those who were so lately stricken down in our midst. For certainly most of the cholera orphans will of two things have to do one, they must obtain the privilege of an orphanage or be compelled to enter the workhouse. And surely of all calamities the calamity of being educated in a workhouse from possibly early in

fancy is the greatest that can afflict a child, henceforth the workhouse is the home, henceforth it will be the naturalized lifelong pauper, always ready and willing to return, and feeling no disgrace in returning to the wretched home of its childhood. Before dismissing this subject I must have the pleasure of referring to one other point which is matter of congratulation to the friends and supporters of the London Hospital.

Capacious as the building is, and well organized as are its internal arrangements, necessity for increased accommodation has long been evidenced by the overwhelming demands of the poor to obtain the advantages which this institution so unsparingly offers. The house committee, under these pressing circumstances, resolved to set their hands to the work. In the month of July, 1864, the foundation stone was therefore laid by His Royal Highness the Prince of Wales for a further extension of the main building.

Completed this summer, the Alexandra wing will largely increase the efficiency of the institution, and afford us, it is to be hoped, the opportunity not only of relieving the poorer residents of our own more immediate locality, but also of extending its benefits to those suffering from aggravated forms of disease even in distant parts of our country. The house committee fondly hoped that the new wing, the erection of which forms quite an epoch in the history of our Hospital, might have been inaugurated with a festal meeting of those who had laboured and sacrificed so much to effect its completion. The sudden appearance of cholera amongst us entirely frustrated such a hope. The new portion of the building was completed when the greatest possible demands were made on us for instant admission. It was here or nowhere that assistance to the poor in this dire attack could fitly be obtained.

The house committee knew that full well, and therefore, without a moment's hesitation, opened the wards which had just been completed, as it were providentially, at the very hour of our utmost need. And thus the building that was to have been dedicated to its benevolent purposes with congratulatory speeches and in festal array, in the presence of the rank, wealth, and beauty of the metropolis, was inaugurated, perhaps more suitably, amidst the threatenings of the pestilence and the ceaseless groans of the sick and dying.

If this large extension is matter of congratulation to the supporters of this noble charity, inasmuch as it increases their active powers of benevolence, it is matter of especial congratulation to us, the physicians, surgeons, and students interested in the observation and investigation of disease. Here vast fields of study are permanently assured to us. Our commodious hospital, now containing 445 beds, affords every facility required for obtaining a thorough practical knowledge of your profession.

The advice that has recently been offered to you in the medical journals to choose a hospital especially for its opportunities of clinical instruction is especially applicable to the hospital of your choice, and has conferred upon our school the remark of sending out from here a body of medical students eminently practical in their acquirements receives here its ready solution. Our hospital now contains 445 beds, whilst the number of our students is certainly less than those of many other hospitals. To the Council of this College this may be, on some account, a matter of regret; but for the student, matter rather of congratulation, from affording to each individual pupil almost unlimited fields for observation, experience, and clinical practice.

Reflect, Gentlemen, what facilities this immense institution, under these circumstances, affords each of you. Think of the appointments in this large hospital which are conferred on deserving pupils. A resident medical officer whose advantages for practical knowledge no words can express, a medical and a surgical registrar, three resident house-surgeons, a resident accoucheur, a resident assistant medical officer, two resident surgical dressing pupils, which, with additional dresserships and post-mortem

clerkships, all these make up such a goodly array of appointments, many of them surpassing in their real value as many college scholarships, and all within your grasp.

Formerly I believe it was the custom in most hospitals that many of these appointments could be obtained only on purchase, but the only purchase money now required is merit. Some other institutions compare, and say, rightly too, that the advantages of these appointments far exceed so many scholarships. I believe it, and I don't hesitate to state that when we compare the number of students in this institution with the number of its appointments, that it is the most richly endowed, second to none in the metropolis.

The few remarks that I have to make on the subject matter of your studies shall be prefaced by a word or two about science in general, and the only manner of successfully investigating her mysteries; not, however, under the supposition that you have not more or less clear ideas on the subject, but because of their fundamental importance, and because in those days of scientific heresies it is even a satisfaction merely to restate the ground on which our profession, as indeed all branches of science, can alone continue to stand.

One of the first observations, then, that we make in the natural world of phenomena is this—namely, that every particular event which presents itself is produced and conditioned by others acting under certain relations to it. Whenever the same conditions and the same experiments absolutely obtain, the connective order of phenomena is always strict and regular, and we are thus led to the conception of a law, and from the universal unchanging order of these phenomena, which can be made a matter of experiment, we are led to believe further that the phenomena that are beyond our manipulation exist under the same conditions, and so we arrive at the idea of an order of nature governed by fixed unalterable laws. Now, if we are to arrive to any knowledge of these phenomena—if we can group them together—if we can determine any order among their apparent complications—if we can determine the number of various ways in which sets of them agree, if we can thus determine general laws—it is plain that it can be only by painful observation and experiment and by a carefully conducted series of inductive, reasonings. And yet it is well known that this method of inquiry has only been established in comparatively modern times, ancient and medical philosophy notwithstanding.

Of science our own profession of medicine is one of the most important branches. Its subject is next to the knowledge of God, the highest that can be contemplated, for it concerns the knowledge of man, physically and psychically his relation to nature, and the various effects which this external world, its laws, its forces, its productions have upon him.

It includes, therefore, the physical sciences of anatomy, physiology, chemistry, *materia medica*, botany, comparative anatomy, &c. It is in consequence of this extended knowledge of physics, which it is necessary for him to possess, that the medical man is called by the name physician—a title which in all ages has demanded respect, and which one has as much reason to be proud of as any of the ephemeral titles bestowed by kings and governments.

The object of our science is the great one of benefiting man by determining what are those conditions; what the means of warding off the inroads of disease, of best defending him from its attacks, so that his constitution may be preserved as far as may be in the possession of that soundness and strength which the CREATOR had originally endowed it with.

Of the various subordinate branches which it is needful for you to pursue, some are more important than others. To you, Gentlemen, of the first year, two or three are now of special interest, inasmuch as they form the only true gateway to the temple of medicine, and because, also, they will, on this account, form the matter of your study during the ensuing session. Of these special studies, the one which demands your closest attention and observation is anatomy. An extensive and profound knowledge of this

subject is not simple, desirable, and important, it is absolutely necessary.

Over the wall of his academy, Plato, it is said, had inscribed, "Let no one but a mathematician enter here." On the wall of the temple of medical knowledge is engraved with the pen of iron not only "Let no one but an anatomist enter," but no one but an anatomist *can* enter. It is the magic key, the open sesame which alone unlocks the portals and enables us to gaze at, and enter into, the temple reared by hands untold; the labour of unknown ages. Gentlemen, let there be no doubt about your possession, this absolutely necessary instrument. Labour to obtain it night and day. You cannot labour too early and too long. You will never regret an hour spent in this vocation. The cost in time and trouble will be considerable, but do not grudge it. The power and facility you will have of entering into other matters when and as you please, will amply reward you for your pains.

At first perhaps you may experience some slight repugnance in prosecuting the labour which the study entails; but leaving out of consideration the ultimate advantage of knowledge acquired, you will find, I have no doubt, immediate stimulus in the interest you will feel in exposing, for the first time, the intimate structure of the human body, and by the admiration, I had almost said reverence, which it awakens in all thoughtful minds.

Well did Prof. Owen, impressed probably by such feelings as these, exclaim, "How vast and diversified a knowledge opens out before us as we gaze from the portal of anatomy. Our study is that of the highest and last created product which has been introduced into this planet. Every part we study has its like in our bodies, it may be vibrating, pulsating, contracting."

The great importance of this study has been felt in all ages by those interested in true science, and anxious to promote her best interests on a sound scientific basis.

It is quite astonishing to observe with what perseverance anatomy was studied in the earliest times when human dissection was debarred by the existing superstition of the age. Even in those primitive times the grandeur of the subject and the natural curiosity of man induced him during the process of embalming, the accidents of life and the catastrophe of the field of battle, no less than the dissection of inferior animals, to make himself acquainted with the leading facts before the period of Aristotle who raised it to the dignity of a science.

In the performance of your difficult task you will have every assistance that is possible to be afforded you. You will find in our excellent lecturer on anatomy and his worthy coadjutor gentlemen ever anxious and able to smooth your path and make your road to anatomical knowledge pleasant and easy, whilst practical anatomy and demonstrations will be conducted by gentlemen constantly at your side; and here, at the risk of reiteration, and trenching on ground not my own, I would remind you of the golden observation of the great philosopher, Locke. The chief art of learning, says he, is to attempt little at a time. This is more or less applicable to all other branches of study, but especially so to the one we are now speaking of, and I have no doubt if the philosopher had been also an anatomist he would have added a special clause in favour of our study.

While I am on this subject I would like to say further, that the student should certainly make himself familiar with the framework of the body as a basis, and then clothe it with the various structures that enter into the human organization. Still I believe it is a great mistake for him to postpone, say the dissection of the upper extremity, before he knows. You can't begin your dissection too early; those of you, at least, who come here with a moderate knowledge of osteology, supplemented properly by a little book reading on the ligaments and muscles, should begin at once. Let your day's dissection be confined to only as much as you can read about and think over when you return to your homes.

I feel confident, from my own experience and the observation of others, that a plan, somewhat after this fashion, will make you better anatomists than if you were to dissect subject after subject without careful observation, supplemented by reflection and assisted by limited reading at your homes of your day's work.

One observation more; it is that the dissecting-room should be as much dedicated to study as the most retired and quiet library. No boisterous sounds should be heard within its walls. This is a regulation that should be specially attended to, not only on account of the difficulty of acquiring a sound knowledge of anatomy without careful observation, reflection, and, I may almost say, abstraction from the outer world, but also because all men, in all ages who have respected themselves and have been worthy of respect, have respected the ashes of the dead ruins indeed, but the ruins of a shrine just departed by a spirit the most wonderful of all the creation of God. All surely animated by the common feelings of our human nature, will agree that any mockery or maltreatment here can only be compared with the most detestable atrocities of savage warfare. But I pause—I feel that I am proffering you unnecessary advice. If such conduct is ever witnessed it is, I believe, quite an exception to the general character of the medical student, and must be relegated to an era now almost, if not altogether, passed away.

Well, Gentlemen, I fear I have in these remarks somewhat crossed the line which I ought to have drawn for myself while in the occupation of this chair. I am quite sure, however, that if the influence of this time and occasion be exerted in endeavouring to stimulate your efforts in the immediate acquirement of the knowledge of the rudiments of your profession, I shall readily be forgiven; and further, if I have in any way secured your resolution to acquire a competent knowledge of anatomy, we need be little anxious about the future steps in your career.

I cannot conceive, for instance, that a student who has made himself master of the preliminary subject of anatomy, and acquired the habit of study and observation which it tends to foster, should require any encouragement in the matter of physiology, while the former study is in some respects repugnant, and many difficulties are to be mastered before it becomes interesting, the latter is a most delightful occupation from the very first, and especially to those well grounded in the structure of the human body. Such will take so great an interest in this subject, that I have little doubt that it will add further zest to his medical studies.

Physiology, the science of life, takes under its domain, in one form or other, most of the latest discoveries in general science; while it, on the other hand, gives them an added importance, a reflected lustre from the importance of the subject which their observations have tended to elucidate. On all accounts physiology, perhaps, may be reckoned one of the most exalted and interesting studies that the mind of man can possibly contemplate. Physiology has also this capital point of interest—that it is at present in a state of rapid progress. The pure mathematicians have had for ages such an amount of unequalled talent lavished on their investigation that their progress is slow. It was with a sort of wonder that we read in the *Times* some short time ago that some professor had discovered a new method of solving a cubic equation hitherto, I believe, considered insoluble. But it is not so in our science of physiology; we should be very much surprised if a year were to pass without some fresh solution, some new discovery made. Of the students now before me we should not consider it as anything truly wonderful or indeed unlikely, if one or more were to make discoveries in this branch of science that should win them permanent European fame. Already in consequence of the wonderful aid that art affords us, the eye of man is able to observe the ultimate cells that by their apparently simple conglomeration build up the tissues, and more than this, he can look on and see these microscopic cells busily engaged in the performance of their individual functions. Thanks also to the assistance of or-

ganic chemistry, for the advance of which we are mainly indebted to Prof. Liebig, we are able to analyze and with the certainty almost of mathematical reasoning, assure ourselves as to the composition of the ultimate.

If the study of chemistry were not required by the examining bodies during your first year you would soon feel the importance of acquiring it yourselves.

As physiology demands a previous or concurrent knowledge of anatomy, so you will soon find that it requires a knowledge of chemistry. These, three, and indeed all the other branches of our art, are intimately tied together. Advance in one branch brings corresponding advances in the others, and proportionate ease in acquiring them. For the prosecution of this study there is, moreover, the additional claim that it is in itself an offspring of medicine; and further, to our own countrymen is due the honour of being its most successful prosecutors, and also of being entitled the "Fathers of Chemical Philosophy."

Its application to pathology is daily becoming more important, and in the diagnosis of disease being independent of the patient's sensations, it gives us conclusive evidence as to the nature of the products furnished by organs primarily or secondarily affected, no less than in testing the tissue or fluids of the body for these poisons, which the supposed invisible hand of the poisoner manipulates in vain. After careful attendance at the lectures and close observation of what is placed before you, you will be able to experiment for yourselves observation again under a more striking form. The course of Practical Chemistry during the Summer Session, under the direct guidance of our much esteemed Lecturer on Chemistry, is not only required of you, but it will give you an aptitude, aye a love, for the science which will keep you in many hours of the early part of your professional career.

In connexion with this subject I cannot resist the opportunity of recommending for your careful perusal the late Professor Daniel's "Chemical Philosophy," and to pay a personal tribute to the memory of one from whose writings I have derived no passing advantage.

These important subjects of study have, as you are all aware, been stimulated by the institution of two scholarships within the last twelve months, one for proficiency in human osteology, the other for proficiency in anatomy, physiology, and chemistry. It is now a matter of great gratification to me to state that two gentlemen were awarded the scholarship at Christmas last, after a struggle honourable alike to him and his competitors.

(To be continued in our next.)

ABSTRACT OF
INTRODUCTORY LECTURE
DELIVERED AT ST. MARY'S HOSPITAL,
ON THE 1ST OCTOBER.

By Mr. HAYNES WALTON,
SURGEON TO THE HOSPITAL.

AFTER thanking the very large audience for their visit to the hospital, he remarked that it was well to meet and rejoice at this medical festival and anniversary, one of the few that the profession possessed, and the birthday of all who have entered medical life in London, and to introduce with proper care many of those who are about to enter the noble brotherhood, and indeed to make the beginning a consecration. He had not looked back among the great men of the past for examples to set before them, neither had he gathered fragments from medical history to amuse them, nor sought quotations from classical authors to astonish them; he gave merely his experience in a few sober truths delivered in plain language.

Following that rule of order which says seniors first, he addressed himself to the many physicians and surgeons present, and attributed the goodly gathering of them to the fellowship which the laws of St. Mary's have established between the profession, the hospital, and the school, adding that it deserved to be well known that the medical governors of the hospital take part as committee-men in all that concerns practice and teaching, in such committees they act on the same footing as the regular medical officers. He asked them in the name of his *confreres* to continue to join heartily in the work, and to assist in the many questions that were ever requiring to be answered. He assured them that the demon jealousy would not pursue them, that many improvements may enter more readily through them, and any neglect or abuse would be the quicker and smoother put down by their assistance. The student would forcibly recognize whatever of good supervision emanates from them, as there can be no secret working among the staff, no unchecked selfishness, therefore no corroding suspicion; he thanked them for what they had done.

In addressing himself to the younger part of his hearers, the pupils and new-comers, he thought it well to tell them something about their educational home, to cast a retrospective eye, and to allude to the things that be. It was right that the history of the establishment be unfolded to them at this time, fifteen years from its organization, and that the present policy be developed. There had been no failures. In the past was registered merely the difficulty of a commencement and recorded the triumph of success. He then gave a sketch of the unprecedented success of the hospital, alluded to the enlargement in the new wing which is being built, and spoke also of its internal arrangements and organization. The marked success of the school was then pointed out, which he considered more astonishing than those of the hospital, as the conditions necessary for its prosperity were of a different nature and more difficult to be reached. No happy accident brought this about but causes clearly to be traced, and thought he ought not to be debarred from alluding to the chief of these on account of their personal nature and because of his being associated with the actors, justice and truth inoffensively put forth should always be admissible. The most promising feature, then, in the new hospital was the largeness and completeness of its staff and the high reputation of the individual members for teaching, writing, and practical knowledge; also, that St. Mary's is well represented in the profession, as the examining boards of our colleges and other bodies testify. It stood high in public estimation, it pleased her gracious Majesty to look there for some to attend her and those most dear to her.

He pointed out that the general proficiency of the students who had been educated there had been the subject of remark by examiners and in private life.

In honour's list they had not disappointed their professors, a large number had sought the competitive examinations and entered the public services—a fact which showed these men had confidence in their acquirements.

In all that concerns the school in the coming Session in legislation and administration, all had been done that could be done for the student's welfare, and to render his teaching as complete and easy as possible, it need to be told the students, for it was scarcely well understood that the work was not all on their side, the teachers had a great deal of care, labour, and fatigue, and in many instances more than they. The teaching of elementary matter was always drudgery to a proficient in his subject, and he hoped the remembrance of this would be a check to any restless spirit that may be in a lecture-room. The student of the present day has everything to his hand, in his time it was not so.

He then alluded to the very long period without any change in the medical staff. For years it was unaltered, and even now the old faces abound. It was not till late this year that death had entered its ranks, and now it fell

to his lot, in the capacity of a public lecturer, to notice the sad calamity, and to allude to the solemn end of our nature, which all healthy minds regard with instinctive dread. He then gave a short biographical sketch of his late colleagues, Mr. Alex. Ure and Mr. Joseph Toynbee.

He then turned to the youngest of his hearers, the fresh men, who that day had taken the most momentous step in their life, and begged that earnest attention, which would assure the remembrance of some portion, at least, of this address to them, they needed guidance and assistance, as that which they were to master demanded a great deal of mental work, and was harder because it was entirely different from anything in which they had been engaged. The first obstacle to be encountered was the apparent magnitude of the task, but he begged them not to be discouraged, as he had felt it as much as any one, and assured them that in three or four months the phantom fright would vanish—that is, if they began in earnest, and that they would be amused at their past fears, although then only would they recognize the amount to be done; yet, there must be work, positive downright hard work—a thing difficult to be understood by youth, and still harder for those who have not had that medical training which should be preliminary to medical education. There are few studies more difficult than those in which they had to engage, and more would be required of them during the next three or four years in mental training and the acquirement of knowledge than at any other period of their lives; the subjects are numerous, lengthened, and intricate, and the sooner they knew this the better; the practice of medicine is not a mere empirical art, nor a mere routine. At the present time there is no more varied or difficult curriculum anywhere established than is required in this country from the candidate for the medical profession.

During that period their character would have to be formed—a work of self-culture and self-development—for it can come only of yourself—a result of more importance to the man individually, and of scarce less consequence to his future patients than the scientific instructions to be received. What is knowledge without character. I do not mean the moral and virtuous, but the cast of mind, the force, the will, the habits of thought and feeling which distinguish a man from his fellows in the affairs of life. Ponder well on this. Remember, according as you sow so shall you reap. With all your desire to learn you must be taught how to proceed, for rule and discipline are necessary. As with physical labour so it is with mental; sharp and severe spirits will be lost in the end, and cause damage to the living machine. In the mental exercise it is the daily little taken in freshly that holds, a fatigued mind can never retain.

[The Lecturer here gave some valuable hints about the hours of study, the division of time, and the surest method of proceeding.]

He found it not possible, if even it were convenient, to offer advice on the several subjects of study, as the individual lecturers would address them with their accustomed earnestness and eloquence, but he selected two of them for a passing notice—Anatomy, Physiology, and Hospital Practice. Anatomy is the first they would set about, as it stands first in importance among all other subjects, for it is the foundation and framework of the profession, all else was to follow and to rest on it. Unfortunately it would present itself in an unattractive form, and must for a time be, except to a very few, a repulsive study. It took a long time for him to overcome it, and had it been possible, he would have given it up; but circumstances obliged him to abide by his choice, and so thoroughly did he overcome his difficulty, that no man of his time ever dissected more, and he was high on the prize list of the then largest school in the kingdom. He mentioned this for their example and not for self-praise.

A knowledge of the human frame and the working of its organs is paramount. A surgeon ought to be as familiar with anatomy as with the clothes he wears. He should be able to find any part or object without a puzzle

of the memory. When he so knows it he will be master of numberless professional details, and be ready for emergencies. As students for the most part left their schools with a miserable stock of anatomical knowledge, he would never lose an opportunity of timely warning. He could speak with authority to those entering the profession. Among other valuable hints, he showed that this knowledge could be obtained only by careful, well-arranged, and repeated dissection, for which the best lectures written and pictorial descriptions could furnish no substitute. The manner for conducting the dissections was then pointed out, and the proper use of descriptions and the injurious use of plates and pictures dwelt on. He sketched a strong contrast between anatomy acquired by practice in the dissecting room and the faint trace which the memory may retain of ideas not originally impressed, the absorbing sight and the vivid touch.

He very forcibly touched on the reverential respect due to the work in the dissecting-room, and stated his belief that the character of a man was more shown there than in any part of his studies. He warned them not to repress too forcibly the wholesome feelings which usually come to a man's mind when he first entered that peculiar place of learning, neither to forget the honour due to human remains, nor so dismiss their own mortality from recollection as to behave with any unbecoming or ill-timed levity.

Physiology and anatomy he considered as one (Abernethy said that anatomy without physiology was like an old maid without a dowry). And who would take the old hag only for herself? Physiology was the science that taught the nature of the phenomena of health, and the inter-dependence of the several organs and functions, the relation of the several parts of the body to the whole, the manner in which life is sustained, so that in the application of their knowledge to diseased states, they should never lose sight of the general and leading principles of it, which demand attention in all instances, and can never be overlooked with safety. The force of this he illustrated by some examples. In connexion with anatomy and physiology, he urged a careful study of minute structure, as revealed by the microscope, and as the only means by which the great mass of pathological changes could be detected, and he assured them that the microscope had done as much for medicine as the telescope for astronomy.

Addressing himself then to students of all ages, he besought them not to neglect the attendance of hospital practice, and he deplored the careless manner in which this was done; he suggested rules for their guidance and methods for assisting them, adducing some experience from his own medical life, and mentioning things he found to be valuable and most useful. He advised them to gather facts for themselves and gain experience. By experience he meant not the simple produce of the senses by observation and reflection. As a strong inducement for their self-instruction he adduced this argument.

A very great deal has been well made out in medicine, and fixed rules established apart from all that concerns what, for convenience sake, may be called a mechanical part of it—that relating to the Art rather than the Science—of which the greater part belonged to Surgery; but at present medicine does not entirely rest on that basis, which is claimed for an exact science. This state of things must not make you heretical, because it arises not from error in the subject, but from want of more knowledge, more time to learn, and more learners.

We cannot deal with animate as we do with inanimate matter, for neither is it subject to like laws nor amenable to the same mode of treatment; neither can we at will take it under our own control, since it is governed by certain vital processes of which we are mainly ignorant; and further, it is under the influence of mind which will not yield itself to man's government. He told them not to be astonished that the treatment of disease in these practical days was constantly undergoing change. It might not be long before they discovered that a large portion of the

value of their attendance in the wards consisted of what they gathered of the natural history of the diseases, the phases and the terminations, rather than the practice of any particular man. He enlarged on this subject, concluding with this:—"You may like to disregard things that I shall tell you about certain drugs for certain ailments, but I hope what I show you in physiology, pathology, and morbid anatomy will be worthy of recollection and will last, and last they will, if I observe correctly."

He then gave a lively description of the alteration which had taken place in medical practice in the last fifteen years, mentioning so great was the change that the older practitioners believed and taught that this alteration was necessary from a change in the type of disease, but happily for St. Mary's, Dr. Markham, in his lectures before the College of Physicians, had proved that there was no change of type but of practice.

He considered the operations conducted in the operation theatre part of the hospital practice from which the students should not exempt themselves, and spoke eloquently and forcibly in pointing out the danger which accrued from a surgeon who knew nothing of operative surgery and yet dared to undertake operations. He strongly advised them to learn the operations first on the dead body under a good teacher before they ventured to cut living man. He regretted the lamentable deficiency in the neglect of proper teaching in this department. It is a blot in our present system of education. He hoped soon there would be a move in the right direction, he would do his best to further it. The necessity for all surgical manipulation was pointed out in detail, and in a manner that must have made a great impression on his hearers.

The clinical teaching, as an extension of the hospital practice, was then reviewed in turn, and the students were admonished that no neglect would be allowed here, as this kind of teaching is a kind of specialty at St. Mary's, and is carefully conducted weekly by all the physicians and surgeons.

The lecturer considered that no class of students, like medical students, from the nature of their studies and the great length of each medical course, required so much recreation and management of health, and devoting a few minutes to the subject he gave advice which cannot fail to be beneficial. He then endeavoured to impress on the students the responsibility and obligations of a man in practice as the most powerful incentive to induce them to work, showing the value of health and the sacredness of life.

After all he had to say about moral obligations, he could not conclude without making allusion to certain duties to themselves which related to their welfare in life, and he could not refrain from this, as he had so frequently under his notice instances of pecuniary distress among medical men and their families, arising out of age, loss of health, or absence of testamentary provision.

He said we cannot all be rich, it falls to the lot of very few to be wealthy, it is not in the nature of the profession to admit of it, medicine and surgery cannot satisfy high ambition in that direction, but we ought not to be poor—that is, we and our progeny ought not to be in want of necessaries. He proved that notwithstanding the severe competition, the demand for medical men was equal to the supply, his remedy against want was for the medical man to raise himself in the social scale by professional attainments, by general education, conduct and manners, and thereby to increase the confidence of the public in the legitimate medical man, and still further heighten the demand for him. To be sufficiently paid for all services and to discountenance, discourage, and destroy that rotten and damaging system of gratuitous practice when patients can pay. He estimated what was lost annually to the profession by this description of robbery. To exercise prudence in the affairs of life untiring industry and frugality, withal a strictly imposed system of economy, and a resolute determination to make an annual saving and investment, be the sum ever so little.

In this respect the profession, he assured them, worked like a trade—that is, by trade rules, or they would fail. With us, he said, it must be labour, labour, labour, and care. There were no sinecures, no snug berths, no large incomes with little work attached, no retiring pensions, such things do not exist, therefore they cannot be obtained.

In conclusion, he begged the students to work with their teachers, adding, get their confidence, they will be as pleased to assist you as you to get their help.

The diligence of a pupil rouses the master. For you to secure the highest attainable advantages there must be association, a social tie, and through this will arise proper respect on both sides.

Regard us then as friends ready to help you, and as fellow-students only a little in advance of you.

ON MELANOSIS OF THE LUNGS, AND OTHER LUNG DISEASES ARISING FROM THE INHA- LATION OF DUST.

By F. OPPERT, M.D., L.B.C.P., Physician to the City Dispensary.

THE subject of this paper has occupied my attention before, but as I am induced by the results of some recent researches to modify my opinion on certain material points, I take it up once more.

Melanosis of the lungs and its principal symptom during life, black expectoration, has been occasionally treated in weekly and monthly journals, but it has not yet found its proper place in the handbooks of medical science. It is well worth while to investigate how far it can be considered a disease *per se*, and by what means endangered persons may be protected.

Melanosis of the lungs means black lung disease; and as the blackness of the lung-tissue is a most essential part of the pathological exhibition after death, we may as well retain this name, whatever may be our opinion on the nature of this blackness. In the same way we may speak of red lung disease, erythronosis, and blue lung disease, glaukonosis.

The class of people who are subject to melanosis are those who work in an atmosphere contaminated with dust, such as coalminers and miners in general, knife-grinders, needle-pointers, quarrymen, stonecutters, millers, and besides it has been found sometimes in aged people who had no trade.

I have had occasionally patients under my care who had a peculiar black expectoration. I have examined specimens of black lung, and seen many in different museums, and for those who take an interest in the subject I may state, that they will find the most in Edinburgh, where there are eight in University College; sixteen in the College of Surgeons; in almost every museum of the London general hospitals are specimens, the most in Guy's, namely, six. On the Continent their number is not so large; in Paris I found only two; there are a few in the Berlin-Charité-Museum, and in Vienna and Munich.

I first give the literature. Scotch physicians have paid great attention to the subject. Pearson already, in 1813, wrote on black infiltration of the lungs and bronchial glands by coaldust, but not before 1831 more numerous and more ably written papers on the miners' disease were published. Dr. Gregory, in the *Edinburgh Medical and Surgical Journal* (No. 109) exposed his views on the black infiltration of the lungs, resembling melanosis, which he had no doubt was produced by coaldust. He had the lungs subjected to distillation, and found the same result as with coaldust. Thompson and Simpson had the same views, and published many cases six years later. One specimen is now at Guy's. The patient Leishmann was

sixty years engaged in coal mines, and suffered for five years after he left off work from asthma and black expectoration. Once the sputa were for two months white. The lungs contained cavities of walnut size and black fluid. Of another case, Hall, it is mentioned that shortly before death he expectorated as much as fifteen ounces of black fluid per diem, and that he had no hectic fever. Had not worked for three years.

Of seven other cases of black lungs observed by Thompson one was that of a blacksmith. In all cases the disease was slow in its progress, and the symptoms trifling in the beginning, only a little dyspnea with bronchitis; and it was especially remarked that the black expectoration remained long after they had given up their occupation.

Dr. Graham, Professor of Chemistry in Edinburgh at this time, examined different specimens of black lungs, and gave as his opinion, that the colour was caused by lamp-black. Dr. Marshall published cases in the *Lancet*, 1836, and was of a similar opinion.

In 1845, Dr. Makellar wrote in the *Edinburgh Monthly Journal* on black phthisis or induration induced by carbonaceous accumulation in the lungs of coal-miners.

He states that there are two classes of workmen in coal-mines, those who are stone miners and work by blasting and those who are holers or hewers. The first are much more attacked by the disease and die sooner. Of all those who had to cut a certain tunnel through a rock, and who were strong and young men, not one reached the age of thirty-five. He is strongly opposed to the doctrine that the lungs secrete the black matter, but thinks that the way in which the miners work explains that the evil is to be found in the small bronchial tubes. They lie on their side, have hardly breathing space, and must make up for it by deep inspirations. First they are able to expectorate whatever comes into the lungs, but after a time the bronchi are not able to produce secretion sufficient to bring the coal-dust away; and when they become dry, irritation sets in, and soon cavities are formed. Makellar always found cavities and no tubercles. Even young men of tuberculous parents died of coal-miners' disease without tubercles, so that he suggests that these diseases may exclude each other. Makellar thinks, there are three anatomical stages—one, where the black matter is in the bronchi and tissue; the second, where small cavities are found; a third, where the cavities are large and occupying even a whole lung. What he mentions about the physical examination is not worth relating.

A case which came under my notice at Edinburgh, was under Dr. Begbie's care. Dr. B., who published it in the *Monthly Edinb. Journ.*, July, 1856, treated it as infiltration of the lung with carbonaceous matter, black expectoration in a farm labourer. The patient had never anything to do with coal-mines or soot. He had phthisis, and the left lung was principally affected. He had black sputa. The post-mortem showed the left lung infiltrated with a black fluid; it contained a large cavity and several smaller ones, only very few tubercles. It is to be observed that the patient, although a farm labourer, was during the last years of life obliged to work the greater part of the year in or near a mill, and to breathe an air charged with dust.

Gouch, who gives a vivid description of the mode of life and work of the coal-miner, thinks, as well as Dr. W. T. Cox, that the blackness of the tissue is not generated in the lungs, but purely of extraneous origin—"Mines of Cornwall," *Brit. and For. Med. Chir. Review*, 1860.

The knife-grinders lung disease has been described by John Charles Hall of Sheffield (*Brit. Med. Jour.*, 1857). Sheffield, which owes its prosperity to its numerous factories of hardware, supplies the market with knives and forks, razors, files, scissors, pins, needles, &c. These useful implements are manufactured by dry or wet grinding. Forks and needles belong to the first class; razors, knives, and scissors are first dry, afterwards wet ground. Those workmen, who have only to do dry grinding are much more

subject to lung disease than the others, and they rarely live after thirty; razor and scissors-makers follow next. Owing to the steel grit entering the lungs, these get diseased, but since better ventilation by fans has been carried on, the state of the workmen's health has improved.

The symptoms and course of the disease are very like that of coal-miners' disease. The workmen suffer first from indigestion, and lose their healthy colour, which becomes dusky. Soon a dry cough and asthma begins to trouble them, afterwards that peculiar black expectoration supervenes. In addition to black pigment, the sputa contain particles of siliceous matter and steeldust, especially shortly after work. Since needles are partly made by machinery, needle pointers suffer less. At the post-mortem, Hall and others found the lungs black, the bronchi dilated, cavities rarely, and their walls covered with a smooth membrane. Pleurisy and pneumonia were sometimes present, tuberculous disease and emphysema occasionally.

Dr. Peacock and Moldenhauer found a remarkable amount of siliceous matter by the distillation of a part of a razor-grinder's lung.—*Brit. and For. Med. Rev.* 1860.

Dr. Greenhow found in a grinder's lung a few apparently crystalline bodies embedded in the tissue besides the black deposit.—*Trans. of the Path. Soc. of London*, 1865.

At the present time most of the medical men in England and Scotland connected with mines with whom I have had conversation about the matter, do not believe the black deposit in the lungs of coal-miners to be anything but coal-dust.

In recently published handbooks on lung diseases, such as Walshe's, or on medicine, such as Aitken's or Tanner's, I find only a short space bestowed upon the subject of melanosis.

French authors have paid some attention to it. To begin with Bichat (*Traité d'Anatomie Descriptive*, t. iv., p. 22, 1819), he thought the black found in the small bronchi was contained in small glands projected into them. Breschet (*Considérations sur une Altération Organique, Appellée Dégénérescence Noire, Mélanose, &c.*, Paris, 1821), thought the origin of the black deposit in different parts of the body to be extravasated blood. Trousseau and Leblanc ("*Récherches Anatomiques et Pathologiques*," *Archives de Médecine*, t. 17, 1828), although they only examined the black deposit in horses, must be mentioned. They thought that melanosis consists in blood corpuscles deposited in the tissues, and in the deposited mass pigment went astray which was originally destined for the choroidea, the skin, &c. M. Foy, a chemical analyst, found the black deposit near the kidney of a horse containing thirty-one per cent. coal-like matter (*principe éminement carboné*). Andral believed the black matter to originate in a transformation of the blood. (*Anatomie Patholog.*, t. 1, p. 458, 1839.) Cazenave the same (t. 19, p. 343).

Guillot was one of the French authors who paid great attention to the subject in question, and especially to chemical and microscopical examination of the diseased lungs. He washed the black parts of lungs with muriatic or sulphuric acid, and boiled them as well, and always had a black mass left, which was unchanged by acid chlor or boiling in concentrated solution of caustic potash. He prevailed upon Melsens and Dumas to assist him in his examinations. Melsens made it first his object to isolate the black mass; he dissolved the albuminous substances by acids and the oleaginous matter by alkalis. When he had the black mass as pure as possible he found it had the character of coal, it glimmered on platina without a flame. Alkalis at a high temperature had no effect. Caustic potash dissolved it by destroying it. Boiling sulphuric acid seemed to have no effect; after long boiling and settling there was an almost clear fluid over a black deposit. Concentrated boiling nitric acid dissolved the mass after considerable time. Muriatic acid had no effect. All this led Guillot to suppose that the black matter was for the most part coal, especially as he sometimes found it had a metallic appearance. (To be continued.)

A BRIEF ACCOUNT
OF THE
RECENT EPIDEMIC OF PUERPERAL FEVER
IN THE DUBLIN LYING-IN HOSPITAL.

By THOMAS TELFORD, M.D., L.R.C.S.I.,
ASSISTANT-PHYSICIAN, LYING-IN HOSPITAL.

THE epidemic of puerperal fever which visited the Dublin Lying-in Hospital in April last, is, I think, deserving of some notice. The suddenness of its invasion, the extreme rapidity with which most of the cases terminated, the anomalous symptoms presented, and the great mortality in the number attacked—sixteen dying out of seventeen cases—mark this outbreak as one of very unusual virulence. The hospital for the time of year was in a fair state of health. During the month of March there were one hundred and seventeen delivered, of those five died. Not that for a moment I consider this an average rate of mortality in lying-in women, but when we take into consideration the class of society from which a great number of our patients are taken, the great hardships and poverty to which they have been exposed, that some of them are the victims of seduction, and that very often they have been mismanaged by some ignorant woman before admission, and also that at this season of the year puerperal fever in common with other zymotic diseases is more prevalent, the number of deaths is not so much in excess. On the 23rd of April a patient, who had been delivered on the 8th inst., died in No. 12 Ward of the small hospital, which is altogether separated from the large building. In her case we had never expected a very favourable result. She was nearly forty years of age, pregnant for the first time, unmarried, and had occupied a respectable position in society. On admission she seemed very much depressed in mind, and complaining of a troublesome cough; her labour was natural, lasting only fourteen hours, her convalescence was slow, but she was able to be up on the tenth day after delivery. She now expressed herself as quite well, the only symptom she had being a very quick pulse, upwards of 120. She had been taking tonic medicine, from which she said she derived great benefit. She determined to leave the hospital on the 20th, and had obtained consent to go; however, as her friends were anxious for her to remain a couple of days longer, she was allowed to do so. The disappointment of not leaving seemed to have a depressing influence on her, and towards evening she was obliged to go to bed. She had a rigor shortly after, and complained of pain and tenderness of the abdomen; the pulse was 120, and the respiration hurried. A turpentine stupe was applied to the abdomen, followed by linseed meal poultices, and a full anodyne given at bedtime. On the 21st the symptoms had increased in severity; pain very acute; pulse 130; respiration 30; tongue brown and dry. She complained of thirst. Ordered a draught containing three drops of tinct. aconite, ten drops of Battley, and half a drachm of chloric ether in one ounce of water, to be repeated every four hours; wine, beef-tea, and some ice, and to have a full anodyne at bedtime. 22nd: The pulse fell to 120, owing to the action of the aconite; vomiting had been added to her other symptoms which remained much the same. Ordered powders of dried soda and grey powder, to continue her draughts, and to have eight ounces of brandy. 23rd: At the morning visit she was evidently dying, pulse very quick and weak, and the skin covered with a cold clammy perspiration. She gradually sank and died towards evening. On the following day we made a post-mortem. On opening the thorax the cavities of the pleura were filled with purulent fluid and the pleura coated over with lymph. The pericardium was distended, and on being opened presented a similar appearance. The cavity of the abdomen was full of purulent matter, and the intestines matted together, the uterus was perfectly healthy, the process of involution having gone on to a con-

siderable extent. This case I think one of great interest, showing, as it does, the influence which the state of the mind has on puerperal women.

Dr. Churchill states, in his work "On Midwifery," that "Mental emotion may undoubtedly be considered an effective predisposing cause. Under its influence females are peculiarly exposed to puerperal fever and less able to bear it; thus it has been remarked that unmarried women are often victims." The late period at which the disease developed itself is also unusual. The post-mortem would lead one to the conclusion that the disease had been going on in a masked form some time before, as it is hardly possible that a woman could be in health and in three days present such extensive evidence of inflammation, not only of the contents of the abdomen, but also of the chest.

On the evening of the day on which this patient died, a woman named Breen, in No. 4 Ward of the large hospital, who had been confined the day before of her seventh child, had a rigor at three p.m., for which she was ordered a warm draught. She was seen by Dr. Denham at the evening visit, and was then quite well, with a perfectly quiet pulse. The rigor was attributed to the coming of the milk, as the breasts were full and hard. It was not thought necessary to order her anything. At nine p.m. I was hurriedly called to see her, as I was told she had a convulsive fit, and though I saw her in about ten minutes on my arrival I found her dead, she having died in three or four minutes after the attack. We attributed death in this case to either primary apoplexy with extensive effusion of blood, or to an embolism. We made a very careful examination of the body next day. The veins of the scalp were congested. On removing the calvaria the membranes presented no unusual amount of congestion. The brain was carefully removed and the ventricles examined. There was no effusion of any kind, serous or sanguineous. The substance of the brain was healthy throughout, there being no evidence of softening. The thorax was next examined; the lungs were intensely congested, especially the posterior lobes. On being cut into a frothy bloody fluid escaped in large quantity. The heart was healthy, the valves being quite perfect; the blood contained in it was as fluid as water, there not being the slightest attempt at coagulation either here or in any part of the body. The abdominal viscera were quite healthy, the uterus well contracted and presenting no morbid appearance.

In the same ward with the last patient were four others, three of whom were attacked, one the same night, the other two the next day, all died, none of them living more than twelve hours after the first symptom.

A woman named Butler was confined of her first child on the 23rd; labour natural. On the 24th she had a convulsion, she was ordered a turpentine enema, mustard stupes to the legs, and cold to the head. As consciousness did not return and the pulse being full and strong, she was bled from the arm to twelve ounces, the head shaved and painted with vesicating collodion; powders of calomel and James's powder were placed on the back of the tongue, and mercurial inunction employed. The mercurials, though steadily persevered in, produced no effect on the system. She continued in a comatose condition with contracted pupil and stertorous breathing; she died on the 26th, two days after her first attack, never having regained consciousness.

On examination the brain and membranes were found quite healthy. The contents of the thorax were in a normal condition. The viscera of the abdomen were also healthy, with exception of the uterus, which presented a dirty green appearance. On making the slightest pressure, the finger ran through it, it being in a perfect state of gangrene. The blood of this patient was in the same fluid condition as that of Breen.

The last case of this mournful list which I shall particularize, had a much more satisfactory ending. She was a young woman confined of her first child on the 23rd; on the 25th she complained of pain and

tenderness over the abdomen, pulse quick, tongue dry. She had turpentine stupes to the abdomen, and was ordered turpentine, punch, wine, and beef-tea. This treatment seemed to agree with her for a short time, when the stomach became irritable. She was then ordered scruple doses of the bisulphate of potash, and eight ounces of brandy, with a full anodyne at bedtime. The following day the symptoms increased in intensity, and vomiting of a very distressing character ensued; for this she had draughts containing soda, Battley, and prussic acid, a blister over the stomach, and brandy and ice. The vomiting was checked by this treatment and the other symptoms ameliorated. On the fourth day she had very troublesome diarrhœa with tympanitic distension of the abdomen. The diarrhœa was checked by chalk mixture and anodyne enemas, and the tympany relieved by passing the long tube. From this time she began to mend and went on steadily to a perfect recovery.

This epidemic was of a peculiarly asthenic type, the powers of life seeming to be totally prostrated from the moment of its invasion.

In the treatment of the cases, wine and brandy were used very largely, some of the patients getting as much as eighteen ounces in the twenty-four hours, beef-tea and chicken broth were also freely given; almost every medicine that has been used in the treatment of puerperal fever was tried, and with much the same result. Opium, iron, the bisulphites of potash, turpentine, aconite, &c. In sporadic cases of this disease, the treatment by draughts containing three drops of tinct. of aconite, ten drops of Battley in an ounce of camphor mixture, alternated with powders of Dover and grey powders, has been very unsuccessful in our hands. We flattered ourselves that we had at last hit upon a plan of treatment which would lessen the mortality of this frightful disease, but our hopes have been cruelly disappointed. In order to test the efficacy of the bisulphite of potash in this disease, were put all the patients in No. 5 Ward five in number, on scruple doses of this salt with ten drops of Battley every four hours, the Battley was added in order to prevent the purging and vomiting which we find this salt to generally produce. Wine and beef-tea were also given freely, and ventilation and cleanliness attended to, yet every patient in this ward was attacked with puerperal fever and all died. Thus, out of a total of twenty-five patients who were in the lying-in wards at the outbreak of the epidemic, seventeen were attacked and sixteen died. We had a patient in the chronic ward suffering from membranous dysmemorrhœa. She was carried off in three days also. The patients who were attacked at the later period of this outbreak lived longer than those first attacked, the disease seeming to lose more or less of its intensity, and we are sure that if the hospital had been kept open the rate of mortality would have diminished considerably. A deal has been written as to whether puerperal fever is infectious or not, and very opposite opinions held by some of our most distinguished physicians. In its epidemic form we believe that almost every patient brought in contact with its influence will be attacked, but that does not prove it to be infectious, as one can hardly call it infection where such a number of patients are attacked almost simultaneously. It is the custom in this hospital to leave patients suffering from this disease in the same ward with others—in fact we never remove them till we anticipate a fatal termination, and then more for the purpose of saving the other patients' feelings than to guard from infection. Still we never find the disease communicated from one to the other. During this epidemic the interern pupils attended the patients who died and were present at and assisted in the post-mortem, they afterwards attended the out-patients when the hospital closed, yet they did not communicate the disease in a single instance.

The post-mortem appearances, in the great majority of the cases, were very unsatisfactory, as only in four cases did we find distinct evidence of inflammation of the abdominal and pelvic viscera. The fluid condition of the blood points to some specific poisoning of that fluid, and

the fact of two of the patients dying of convulsions may be accounted for by toxæmia, which we knew to be a frequent cause. I should have mentioned, in relating the convulsive cases, that the kidneys were perfectly healthy in both.

The poison which produces puerperal fever has been supposed by some to be identical with that which produces erysipelas. This was to a certain extent borne out by the fact of one of our wardmaids, who had been constant in her attendance of the patients, being attacked with erysipelas of the head and neck of such a severe form that she died in St. Vincent's Hospital.

I may also state that erysipelas was very prevalent in the city at the same time, and in some of the surgical hospitals the surgeons were obliged to defer any operative proceeding. After this outbreak the hospital was white-washed, fumigated, and painted. Since then we have had 245 deliveries, including cases of turning, hæmorrhage, convulsions, &c., and only one death—a woman who was brought in a dying state—from placenta prævia; she died a few moments after delivery.

As I said before, we have found the treatment of sporadic cases of puerperal fever by aconite and opium very successful. The aconite quiets the circulation and allays pain, which is often very intense. It requires, however, to be carefully watched. A patient under its influence should be seen at least twice a day, as in some cases its action on the heart is rapid. I have observed that where it produces its sedative action the cases generally terminate favourably, whereas in some of the fatal cases it seems to produce no effect whatever. In some cases we have given as much as ten drops of Fleming's tincture every four hours without diminishing the pulse a single beat. I am afraid that, in the epidemic form, we may come to the humiliating conclusion that treatment is almost useless, the vital powers being completely prostrated before any medicine has time to act.

ON RUPTURE OF THE UTERUS.

By Dr. G. de GORREQUER GRIFFITH,

PHYSICIAN TO THE HOSPITAL FOR WOMEN AND CHILDREN; PHYSICIAN-ACCOCUCHEUR TO ST. SAVIOUR'S MATERNITY; AND LATELY HOUSE-SURGEON TO THE LONDON SURGICAL HOME.

Some little time since I was called in to attend in her last moments the patient whose case I shall relate:—

Mrs. B., aged 36, married twice; by the first marriage mother of seven living children, and by the last, which had taken place only within the year preceding her confinement, mother of the child to which she gave birth on the occasion of my attendance. The patient, it seems, always enjoyed excellent health, knowing nothing of personal illness, except when she was in labour. She was of stout habit of body, being well nourished.

I had been summoned because of the fearful hæmorrhage which had taken place after the birth of the child, and which had continued for so long a time as to alarm the attendants, and likewise because the placenta was retained and would not come away by any efforts of the midwife.

When I arrived—I was summoned an hour or an hour and a half after the birth of the child had occurred—I found the patient lying on her back, with the knees drawn up towards the abdomen; so restless and unquiet that she did not remain in one position for a moment, but kept tossing herself about on every side, although the child was not yet severed. Her face, neck, chest, and as much of the surface of the body as was uncovered, completely blanched, having that peculiar pallor which is, perhaps, alone met with in patients suffering, as in the present instance, from excessive loss of blood; the eyes bright and glistening, but sunken and expressionless, having the pupils largely dilated; the face and entire of the body bathed in a clammy sweat; the former being anxious-looking and sorrowful; the body cool, and the extremities

cold, though the night was hot and the room excessively close; the pulse at the temples not to be felt, while at the wrist it was almost imperceptible; the respiration, short and hurried, attended with dilatation of the nostrils, with difficulty, and with very much pain. The pain felt in the right side was so excessive that it scarce admitted of her breathing. In addition, the patient kept calling out that she was dying, that she could not any longer endure the pain in her right side—it extended from a little below the right breast down to the iliac fossa—that it was worse than the pains of all her labours put together, and was killing her.

She told me that her labour pains had suddenly left her just as the child was being born; that she had had none since its birth, the agonizing pain in her right side having taken their place.

It was evident that the patient was fast sinking. My first cares were to have some brandy given to her, to have the womb supported and compressed by an attendant, while I separated the child, which was of immense dimensions and alive.

The blood flowed from the vagina, not in sudden jets, but in a continued stream. It had soaked through the bed, and flowing on unchecked, fell upon the floor, where was already collected a large firm clot.

For the safety of the child it was incumbent upon me to separate it at once, because the mother, as she shrieked out in the agony of her pain, tossed herself about violently, seeking to obtain relief from her sufferings.

When the attendant had taken the child I endeavoured to grasp the uterus myself, but found it an almost impossible task, because, in the first place, the walls of the abdomen were loaded with thick, hard fat; secondly, because they were so very pendulous that they overhung the pubic arch; thirdly, they were ruptured at the umbilicus, umbilical hernia existing; fourthly, because the womb itself had not apparently at all contracted, but seemed to reach up to the diaphragm, where it lay flaccid and uncontracted.

With some difficulty I succeeded in encircling the upper part of the womb with my left hand, but could not get the womb to respond to the stimulus supplied by my hand, and therefore could not embrace the entire volume of the uterus, as is ordinarily done after the expulsion of the placenta. While essaying to accomplish this latter manœuvre with my left hand, at the same time that I applied, by means of the right hand, gentle steady traction upon the funis, in hope that by this traction and the compressive force exercised upon the womb in a backward and downward direction I might be enabled to get away the detained after-birth, I thought that I detected a longitudinal rent in the right side of the womb. I therefore desisted from compressing the uterus, and having through the abdominal walls made a gentle examination of the organ, I became strengthened in my diagnosis. There was a very evident line of depression corresponding to the place which the patient indicated as the seat or line of pain, and where she could not bear the slightest pressure, without experiencing most excruciating pain.

For the pressure of my hand I substituted the support of a binder, not put on too tightly, yet in such a manner as might tend to keep together the edges of the rent in the uterus, and so, if possible, prevent the extrusion into the abdomen of either the placenta or clotted or fluid blood, or of the slipping down of the intestines or omentum, or of both, into the uterine cavity, and their being nipped or otherwise injured between the lips of the rent. The binder having been properly fixed and the terrible hæmorrhage restrained, I took the cord, which was quite flaccid, in my right hand, had the back of my left hand well oiled, and then passed it (made into a conical shape) along the cord, which I kept between the fore and second fingers, in order that I might be guided directly to the placenta, and, as I hoped, into the uterine cavity.

When the hand was in the uterus I confirmed my diagnosis of rupture of the uterine walls. Neither the

intestines nor the omentum had slipped into the uterus through the tear which existed along the right side, but the membranes which entangled themselves in my fingers very much resembled in feel the omentum, so much so as to lead me at one time to fear that the apron had come down, and had entered the womb. By carefully following the funis as a guide, I ascertained for certain that what enveloped my hand was the membranes of the fœtus.

Having satisfied myself of this, I continued to advance the hand higher up, till it reached the left cornu or horn of the uterus; here I found the placenta. I next pulled it away from its attachment, and in withdrawing the hand I again made certain of the laceration in the womb, and found it to extend through the body and cervix. This, no doubt, was the occasion of the excessive pain in the right side.

Having removed the placenta and readjusted the binder, I administered another dose of tinct. opii. The patient could not be made to keep herself quiet, but continued tossing herself about, now on one side, now on another, now on the back, then again on the abdomen.

About two hours after I first saw her she turned on her left side, and seemed to fall asleep. It was the sleep of death. She awoke no more.

The midwife weighed the child, and assured me that its weight was 14lbs., wanting only a few ounces.

Since writing the above I have learned that this poor creature had not been married the second time, but that the father of her child was her own father-in-law, to whom she had acted as housekeeper in the absence of her husband during the last twelve months; that she had come up from Woolwich to London merely for the day, intending to return to the former place in the course of the afternoon, but that she had been prevented by her labour coming on at the close of her journey; that the midwife who had seen her before I was summoned had not been engaged to attend her, but living in the same house as that in which the patient was taken in labour, had been hastily called, and had sent for me as soon as she saw the nature of the case.

9, Lupus-street, Pimlico, London, S.W.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS.

DR. LYONS'S CLINIQUE.

STENOSIS WITH OBSTRUCTION OF AORTA.

THE following case illustrates in a marked manner the views already published by Dr. Lyons with regard to the comparative suffering, duration of life, and implication of organs secondarily in connexion with the heart in stenosis of the aortic orifice, as contrasted with the dilated state of the vessel at its origin:—

M. C., a female, unmarried, aged 24, with no history of any rheumatic affection, and by her own statements ill but a fortnight, was admitted into the Whitworth Hospital, under Dr. Lyons's care, labouring under extreme dyspnoea with general anasarca. The face presented a congested appearance with tendency to lividity of the lips, and the general aspect of the case was that of a patient in the advanced stage of confirmed mitral valve disease. The urine was natural in appearance and specific gravity, and contained no albumen at any time. The pulse varied from 90 to 120, and was moderate in force and volume, and in no way specially remarkable. The cardiac action was perceptible over a largely increased area, and exhibited a heaving impulse with much distress to the patient, who could but rarely lie down by day or night. On applying the stethoscope a distinct double sawing murmur was audible over the whole cardiac region, and propagated both towards the aortic arch and the cardiac apex. No extension of either of the sounds was discoverable towards the axillary region. The detailed history of the case need not be followed up to the close, all treatment proved unavailing, and

the patient gradually sank, and died, after much distress and suffering, within three weeks from her admission.

On post-mortem examination, extreme general anasarca with dropsical effusion into the abdomen was observable. The lungs, liver, spleen, and kidneys were much congested. The pericardium was distended with some nine or ten ounces of clear serous fluid. The heart was of an ovoid figure, and enlarged to about three dimensions. On opening the left ventricle the mitral orifice and valves were found in all respects normal. The mouth of the aorta was constricted to an extreme degree, barely admitting the tip of the little finger, while the valves were surcharged with vegetative matter of considerable density projecting towards the ventricle and the aorta, with much prominence on either side. The obstruction offered to the egress of blood from the ventricle into the aorta at each systole of the heart was well exemplified by the difficulty experienced in getting a spoonful of water to trickle through the closely-set valvular obstructions when the heart was inverted, although regurgitation was permitted freely enough from the aorta into the ventricle.

The case is worthy of notice, as presenting an extreme instance of rapidly fatal aortic stenosis.

It is further noticeable, as an illustration of the resemblance produced between aortic obstructive disease and mitral regurgitation, so far as dyspnoea, lividity, and general dropsy, with early fatal issue.

It stands in marked contrast to the examples of aortic obstructive disease with *compensating dilatation* of the mouth of the aorta, already published by Dr. Lyons, and some of which still survive in the enjoyment of fair average health.*

ON

URIC ACID INFARCTION AND CONGENITAL CYSTOID KIDNEY: TWO CASES.

By W. KOSTER.

Translated from the *Nederlandsch Archief voor Genees- en Natuurkunde*, Deel ii., 2e Aflevering, Utrecht, 1866, p. 169.

By WM. DANIEL MOORE, M.D. Dub. et Cantab., M.R.I.A.

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS, OF THE NORWEGIAN MEDICAL SOCIETY, AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; EXAMINER IN MATERIA MEDICA AND MEDICAL JURISPRUDENCE IN THE QUEEN'S UNIVERSITY IN IRELAND.

1. *Extensive uric acid infarction of all the renal papillæ in a child—Death from convulsions on the thirteenth day after birth.*—In the middle of last month (October), a father presented himself to the physician of the hospital at Utrecht, with the body of his child aged thirteen days, who, after having suffered for some days from convulsions, had died. He stated that all his former children, four in number, had got convulsions in from ten to fourteen days after birth, just as that now deceased, and had very soon succumbed. The children, including the last, were in other respects well developed, and for the first few days were apparently quite well. The hope that by the examination of the body, the cause of the disease and indications for the medical treatment of the same, in case another child should be born to him in whom the same symptoms might present themselves, might be discovered, induced the father to follow this course, which is certainly very unusual in persons in the lower ranks.

I performed, with Dr. Imans, the post-mortem examination. We found extraordinarily great hyperæmia of the brain and cerebral membranes; great distention of the sinus of the dura mater and of the larger vessels of the pia mater with fluid blood. In the thorax was nothing unusual except paleness of the lungs, and comparatively little uncoagulated blood in the heart.

See Dr. Lyons's "Clinical Lectures on Disease of the Heart." Dublin: Fannin and Co., 1863.

In the abdomen was a very considerable degree of hyperæmia of the intestinal mucous membrane, particularly of the ileum and large intestine. The liver, stomach, and spleen were normal. The bladder was *perfectly empty*, the ureters were normal, as were the pelves of the kidneys. One kidney was cut into and exhibited in all the papillæ a very great quantity of yellow and brownish strizæ, completely resembling the well-known uric acid infarction. The kidney otherwise presented no morbid alteration: only the tubuli uriniferi exhibited, above the seat of the infarction, which reached half-way to the Malpighian pyramids, great distention with epithelial cells. In the cortical layer, too, the convoluted tubes were plugged with strongly coherent epithelial cells, completely filling the tubus. The same was observed in the capsulæ glomerulorum.

The other kidney was injected through the artery with Beale's blue. Subsequent examination showed, that here too *all the papillæ* presented extensive uric acid infarction. Neither the glomeruli nor the vessels of the Malpighian pyramids exhibited anything abnormal. In this kidney too the great quantity of cells, which completely filled the tubuli uriniferi, but in other respects presented no morbid changes, caught the eye.

After the action of water of caustic potash on the section of the renal papillæ the yellow and brown strizæ disappeared, and the little cylinders, which filled the extremities of the tubuli recti, appeared to consist of coherent and morphologically altered epithelial cells. The wall of the tubes was here and there now scarcely visible. The reaction with nitric acid and ammonia distinctly indicated the presence of uric acid.

A very distinct idea of the extraordinary diffusion of the uric acid infarction in this case was obtained by inspecting transverse sections of each of the renal papillæ. The brown points could then be distinguished from the open normal urinary canals. It might be assumed that from one-third to one-half of the canals were obstructed by the infarction.

The question at once suggests itself, whether there was a pathogenetic connexion between the convulsions and the infarction of the renal papillæ, and whether the death of the former children at the same age, with the same symptoms, did not probably also depend on uric acid infarction of the kidneys. As to the last point of course no certainty is to be had; but the answer to the first question must, I think, be in the affirmative, whence some *probability* arises for the presence of uric acid infarction also in the former cases.

So far as the medico-legal signification of the uric acid infarction is established, as it has never been met with in children who have not lived—that is, breathed *extra uterum*—so little certainty have we respecting the connexion between the infarction and *diseases* of the newly-born child. It is not my object here to treat of the whole very complicated question* of the origin of renal infarctions in newly-born children, but to state the reasons which induce me to consider the infarction in my case as the cause of the convulsions and of the death of the child.

Schlossberger was the first to make known a great number of cases of uric acid infarction, with reference to the connexion between the renal affection and the morbid phenomena in the children. He attributed the occurrence of the infarction chiefly to functional disturbances of the intestinal canal, as he met with it especially in "atrophia acuta" and icterus neonatorum, between the second and the nineteenth day after birth. Whether the infarction is to be considered only as the result of these indeed very indefinite morbid conditions, or in its turn as cause of the disease, does not distinctly appear from his considerations. In either case, however, he looks upon the phenomenon as pathological.

Engel, on the contrary, attached no pathological im-

* See Schlossberger, *Archiv fur physiol. Heilkunde*, 1842, I., Hft. 3, and Virchow: *Gesammelte Abhandlungen*, pp. 833 and 843.

ortance whatever to the uric acid infarction. Virchow, who himself communicated some cases, and moreover treated in detail of the physiological changes in the organism of children after birth in connexion with the origin of the infarction and the forensic importance thereof, is very hesitating in the expression of his opinion as to the significance of the infarction as *morbid cause*. But he even suggests means, by making the urine alkaline, of causing the supposed infarction to disappear in living children. His opinion as to the *exceptional* occurrence of the infarction even early in the fœtus, and the thereon dependent existence of the congenital renal cystoid, be speedily extracted, and it is very improbable.

That the uric acid infarction is in a certain measure a physiological phenomenon, that it will occur and often disappear also in normal children, is very probable. The many cases, in which it has been met with in children who, after a difficult labour, had lived only a short time, and in children who had died evidently from other causes than disturbance of the renal function, are proofs of this. The process of respiration and of the production of its own heat, which commences immediately after birth in the system of the child, the whole sudden and important revolution in the nutrition and metamorphosis of tissue, give rise to a state of the blood and of the urine, in which lies the conditions for the granular and crystalline excretion of urates. Virchow endeavours to compare the state of the organism of the newly-born child with that of a person in fever; whereby we might acquire a certain idea of the excessive formation of uric acid, so far as we comprehend it in fever. But into the whole physiological inquiry we do not here enter. The question is only; whether the physiological process, which in most cases proceeds without detriment to the system of the child, may not, where very extensive, and under particular circumstances, become a source of morbid deviations and a cause of death? How many diseases are there not, which result from a gradual modification of a physiological process.

This question must, I think, be answered in the affirmative, and in particular with respect to the case I have communicated, it may be assumed that the convulsions were dependent on impeded secretion of urine, and that they, *cum grano salis*, may be called uræmic convulsions.

1. The child was well developed, and during the first days of its life was perfectly normal.

2. For a contemporaneous, very violent hyperæmia of the brain and intestinal canal, no other cause was discoverable; while in a case of uræmic intoxication, such a condition would excite no surprise.

3. There was not a drop of urine in the bladder.

4. The uric acid infarction was *very extensive*, and the epithelium in the extremities of the tubuli recti was consequently quite altered and coalesced, so that the tubuli were distended and actually obstructed.

It is unfortunate that we could obtain so little accurate information as to the morbid symptoms. The child had, according to his father's report, "passed water well." To this statement but little importance either for or against is to be attached. If, on opening the body, the idea of infection of the blood had been stronger, we should still have been able to attempt a chemical examination of the blood. But if we consider how little positive information the best investigations of the blood of uræmic patients have afforded, that Kühne and others have been unable to demonstrate the presence of the supposed carbonate of ammonia, we may suspect that we also should, in this instance, have attained but little certainty.

In the present state of our knowledge of uric acid infarction and of the circumstances under which it occurs and may act prejudicially, we must be content with the most probable inference from the facts ascertained. And this inference may, it seems to me, be what we have above assumed.

In any case, the advice was given to the father, if in a subsequent child threatenings of convulsions should occur in a few days after birth, immediately to administer carbonate

of soda, magnesia, vegetable acids, &c. in large quantity, in the hope that the alkaline urine might dissolve the precipitates of uric acid and the urates in the epithelial cells of the Bellinian tubules, in the same manner as we see the infarction disappear under the microscope on the addition of soda or potash.

(To be continued.)

M. BOUCHUT ON OPHTHALMOSCOPY IN A CASE OF CHRONIC ENCEPHALITIS.*

Translated from the *Gazette des Hopitaux*, July 31st, 1866.

By BALTHAZAR W. FOSTER, M.D., F.L.S.,

PROFESSOR OF CLINICAL MEDICINE IN QUEEN'S COLLEGE, AND PHYSICIAN TO THE QUEEN'S HOSPITAL, BIRMINGHAM.

YOU have already on many occasions been able to prove for yourselves how advantageous is the application of ophthalmoscopy in the diagnosis of certain diseases of the nervous system, and each day new facts are added in support of this new method of investigation. Many of you have seen the patients whose cases are detailed in my treatise "On the Use of the Ophthalmoscope in the Diagnosis of the Diseases of the Nervous System;" and even in acute meningitis, in chronic hydrocephalus, in partial encephalitis, in cerebral tubercle, in compression, in concussion, in cerebral hæmorrhage, and in the softening of old age, &c., you have been able to see that in the fundus oculi are found changes hitherto unknown, but whose signification is of the greatest value in diagnosis. It is worthy of remark that in these researches you have been able to observe for yourselves the relation existing between the deep-seated changes in the eye, the nervous symptoms presented by the patients, and the post-mortem appearances. In this manner it is easy to learn quickly the practical importance of the semiology, that I proceed to describe to you.

To-day I shall speak to you of a new and important fact in cerebroscopy. It refers to the little girl lying in No. 32 bed, in the St. Catherine's ward, who was affected with right hemiplegia, without any apparent disorder of sensation or sight. An attack of measles happened to carry her off, and this accident enabled us to compare the symptoms of hemiplegia noted in the case—1stly, with the ocular lesion, which pointed to an organic affection of the brain, and afterwards with the variety of cerebral disease which had caused the paralysis.

In the first place, let us repeat the history of the case as collected in your presence:—

Chronic partial encephalitis—Atrophy of the left cerebral hemisphere and nerves—Right hemiplegia with tonic spasm—Granular infiltration of the papilla.

Marie A., ætat. 4 years, entered the Hospital for Sick Children, bed 32, St Catherine's ward, on March 12th, 1866, for hemiplegia of two years' duration, which had gradually come on after some transient convulsions. The right side of this child's body was more feeble than the other, she could stand upright on her limbs, but could not walk. No insensibility whatever, and no disorder of the senses.

The eyes, on examination with the ophthalmoscope, presented†—on the right side granular infiltration of the papilla, [which concealed its superior half,] and apparently broken continuity of the veins; on the left side there was also a little infiltration around the papilla, but the vessels

* Delivered at the Hospital for Sick Children, Paris.

† The original paper contained an illustration of the ocular lesions.

were small and continuous. Above there was a little whitish deposit of minute granules.

The left eye exhibited but little infiltration of the papilla. General health good.

A month after her admission the child was attacked by measles and pulmonary catarrh, of which she was cured, but during convalescence a cachectic impetigo appeared on the body and vulva, and also tonic spasm of the right arm; the hand was flexed on the forearm, and the fingers presented a very peculiar deformity characterized by extension of the first phalanx, straightening (*rédressement*) of the second, and flexion of the ungual phalanx. Died April 24th.

Autopsy.—The brain covered by the dura mater appeared to have symmetrical hemispheres, but on dividing the dura mater it was seen that the left hemisphere was much smaller than the right. It was seven centimetres less in length, and the deficiency was filled up by a serous cyst, which by its central position between the convolutions divided them by a deep fissure which descended even to the corpus callosum. The arachnoid showed a pearly transparency, and the pia mater was everywhere, but more especially on the convexity of the organ, infiltrated with an unhealthy coloured serum. The left hemisphere was divided into two lobes furnished with convolutions, and covered with grey matter. The fissure descended even as far as the corpus callosum, and was filled up by a collection of serous fluid situated under the arachnoid, but containing no echinococcus or cysticercus cysts. Nothing can be said with reference to the investigation of the atrophied brain substance, because from being hardened in a strong solution of chromic acid, the anatomical elements were, for the most part, indistinguishable. With regard to the optic nerve, the microscopical examination could be made in consequence of the great thickness of the neurilemma which had protected the nerve substance, so that it was only slightly affected by the reagent. I was able to prove that there was in reality an atrophy of the optic nerve. The neurilemma had been the point of departure of a proliferation of the connective tissue; this proliferation extended from the periphery along the neurilemma towards the centre of the optic nerve. Thus, while towards the external part I found nearly everywhere the embryo-plastic nuclei belonging to the two first stages of the evolution of connective tissue, in the deeper parts the bundles of fibres were almost completely developed. This hyperplasia had extended between the nerve tubes and had caused a great number of them to atrophy. They were, however, still easy to recognize, for this anatomical element does not disappear all at once, but gradually, so that the successive changes through which the nerve tubes pass prior to complete atrophy, could be readily distinguished.

Microscopical examination of the brain, the optic nerves, and the eyes.—Note added by M. Ordonez.—In examining the retina before it was subjected to any change by the preservative fluids, the following peculiarities were discovered:—

1. The whitish spot, situated above the papilla, was found to be entirely composed of fatty granular molecules.

2. At no part of this spot could the least trace of the anatomical elements which compose the different layers of the retina be found.

3. The capillary bloodvessels in this situation did not contain the least trace of blood globules; and their walls were studded with atheromatous particles.

4. The choroid had lost much of its pigment.

5. On all the other portions of the retina the presence of its component elements could be demonstrated, even the rods, notwithstanding the time elapsed since the death of the patient.

The corpus callosum, the corpus striatum, and the optic thalamus were atrophied, the latter was only one-third size of the other (right). The left optic nerve, from its origin to the commissure, was less than half the size of that on the right side, and this disparity continued even to its entrance into the eyeball. The other nerves of the

left side of the brain were proportionally atrophied. The left eyeball was smaller than the right, and the vessels of the retina were found to be more numerous at the inferior than the superior part. The papilla was infiltrated above, and had on its border a greyish pearly granular mass, as large as a small pin's head, composed of fatty particles.

The right eye presented no morbid change visible to the naked eye.

Remarks.—In the case of this little girl one was obliged to ask oneself,—What was the nature of the hemiplegia with which she was affected, and which had come on after convulsions two years before her admission to the hospital? Was it a muscular paralysis dependent on granular degeneration of the muscles—the essential paralysis of West, Rilliet, and Barthez, but attributed to a lesion of the anterior columns of the spinal cord by others (Lamorice, Cornil, &c.) or was it, on the other hand, a paralysis of cerebral origin?

The study of the antecedents and history led me to believe that it was referable to an affection of the brain rather than to a fatty degeneration of the muscles. Indeed the hemiplegia had succeeded to convulsions, and there was not that marked atrophy which accompanies the paralysis of fatty wasting or the muscular atrophy of infancy. On the other hand, there are essential convulsions which leave after their termination paralyse, of which the material cause is unknown. The situation was therefore very embarrassing, and a great degree of uncertainty surrounded the diagnosis.

It was under these circumstances that, wishing to see the condition of the brain through the eye, I found on the papilla and on the retina morbid changes which enabled me to affirm that the hemiplegia depended on an organic lesion of the brain, and from a consideration of the course, the succession, and the chronic character of the symptoms, I concluded that there was a chronic localised meningo-encephalitis.

This diagnosis was verified by the post-mortem examination, when there was found considerable atrophy of the left hemisphere of the corpus striatum, of the optic thalamus, and corresponding optic nerve, and a marked degeneration of the retina, the details of which are given as sent to me by M. Ordonez.

To recapitulate—chronic encephalitis—causing atrophy of one of the cerebral hemispheres, hemiplegia on the opposite side of the body, fatty retinitis, and ophthalmoscopy enabling us to infer from this appearance the lesion of the brain. These are what the case offers of novelty and interest. It is one more example to add to those which I have already published to demonstrate how useful is ophthalmoscopy in the study of the acute and chronic affections of the nervous systems.

A PHYSICIAN KILLED IN AN ASYLUM.—Dr. Greenup, formerly of Salisbury, for the last fourteen years superintendent of the Paramatta (New South Wales) Lunatic Asylum, holding also the offices of medical adviser to the government and examiner of Sydney University, has been killed by one of the patients in the asylum. He was stabbed, and died in two days, after much suffering. His last words were, "No one is to blame for it." He fell a victim to his humane disposition, which led him to be too trustful even of men confined in the criminal division of the asylum.—*Sydney Morning Herald*.

A NEW BRANCH OF MEDICINE.—We clip the following from the *Lancet*:—"On the 6th of June, James Appleyard, Esq., Surgeon, &c., of Mortlake, to Mary S., eldest daughter of John Macfarlane, Esq., J.P., Surgeon and Squatter, of Ee-Yeuk, near Mortlake, Victoria, Australia."

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 3, 1866.

THE MEDICAL SESSION OF 1866-7.

THE Medical Session of 1866-7 was inaugurated in the London Schools of Medicine on Monday last. The usual Introductory Lectures were delivered before the customary audiences of old and new students and of mature practitioners revisiting the scenes of their youth, and by the time that these remarks are in the hands of our readers, the professors and their pupils will have settled down to the business of the year.

Although the London Schools and most of the other English Schools of Medicine commence their labours simultaneously on the 1st of October, it is well known that the Irish and Scotch Schools do not begin until a month later, and this difference of plan is to be regretted, as tending to impair the uniformity which ought to prevail among the Educational Medical Bodies of the United Kingdom. In our opinion there is very little to be said in favour either of altering the date of opening the Irish and Scotch Schools to a month earlier, or of postponing that of the English ones a month later. It may be said, indeed, that the month of October is often a fine one in England, and that it is hard to bring the students to the large cities before the winter has fairly set in; but, on the other hand, the weather in October is cool enough to allow of the practice of dissection, which ought to be commenced by the student as early as possible; and if the Session began in November, it would allow only about six or seven weeks of study before the Christmas holidays, which, in England at least, are always observed, and are spent in relaxation. In Scotland and Ireland, again, the summoning of the students on the 1st of October would, perhaps, be such an innovation on time-honoured customs that it would lead to considerable inconvenience, and perhaps to some ill-feeling, and we have even heard it said that so general is the feeling in favour of the present system in those countries that arrangements are often, if not commonly made, for the students to pass six months of the year away from the Schools, and in occupations more or less of a private nature, such as assistantships, &c. Still we cannot say that we altogether approve of such a division of the student's time, which leaves far too little opportunity for the discipline of the lecture-room, the dissecting-room, the laboratory, and the hospital, and if no other scheme could be hit upon for reconciling the present anomalies between the English, Scotch, and Irish Medical Schools, we do not see why a middle course might not be adopted, and the Session be opened at an intermediate period—say the 15th of October.

However, the London Schools have all begun their curricula for the present year, and we wish them all

success. Many changes have taken place in the *personnel* of the Lecturers and Medical Officers; but, generally speaking, the usual occupants are found in their respective places, though the younger aspirants have, in some instances, moved up some steps higher, and some of the older and more familiar figures have relinquished a part of their duties, if not all of them, to their juniors.

To those who have passed through several *lustra* there is not much novelty in the opening of the Medical Schools, or in the addresses with which they are accompanied; but the mind would be a churlish one which should behold unmoved the spectacle of some thousand or more youths entering upon the thorny career of Medicine, the attractions of which it is difficult for many persons to appreciate, and the dangers of which it is but too easy to foresee. The old, old story of the Introductory Lectures is the inculcation of the necessity of study on the part of the alumni, and the uncertainty of the rewards which can be expected to follow from so much toil; and no one can contemplate the ruddy faces and beaming eyes of so many of the listeners on the benches of the lecture-theatres without breathing a hope for their future prosperity, not perhaps unmixed with a sigh for the disappointments which many must necessarily endure. It must be admitted, however, that those who are now entering the profession have a better chance than many of their predecessors, for the necessity of having passed a Preliminary Examination in Arts, and perhaps other collateral circumstances, have diminished the number of medical students, while the demand for qualified practitioners, not only at home but abroad, is greater than ever. The students, therefore, who are now commencing their career, are on the whole a superior class, and the high character of their attainments with the diminution of competition, will in all probability secure to them in the future a better position, both social and pecuniary, than many of their progenitors have been permitted to occupy.

Notes on Current Topics.

PROPOSED MEMORIAL TO THE LATE SIR CHARLES HASTINGS.—It has been proposed by several influential members of the British Medical Association to institute a fund entitled the "Hastings' Memorial Fund," in honour of the late respected founder of the Association. At the recent meeting of the Association at Chester it was resolved that the best memorial of Sir Charles Hastings would be formed by raising a fund, the interest of which might be presented to the recipient of the Hastings' Medal, a prize already annually offered to the best essay by a member of the Association on some medical subject. The object of this annual donation is therefore to offer some more solid reward than that now conferred by the presentation of the medal, and thus to encourage medical men to pursue scientific investigations, which cannot be carried on without considerable outlay. We understand that nearly £200 have already been subscribed for this very laudable object, and we hope that the whole profession will respond to the appeal which is now made to them.

The Hastings' prize is already an honourable object of ambition, and it will become still more so when its value is enhanced in the manner contemplated.

THE CASE OF MR. BEANEY, OF MELBOURNE.—We have received from Melbourne a great amount of correspondence and of reports in reference to a trial in which Mr. Beaney, a Fellow of the London College of Surgeons, has been concerned, the proceedings terminating in his honourable acquittal from a charge of murder. The evidence is so voluminous, the statements made by several of the witnesses so unsatisfactory, and in many cases so uncontradictory, that we find it very difficult to give a connected view of the various inquiries made as to the charges preferred against Mr. Beaney. The charge against that gentleman appears to have been that he caused the death of a female by endeavouring to produce abortion, and he has undergone three trials, the last of which has ended in his acquittal. He himself entirely denies the charge against him, and states that the case was one of uterine disease, in which he employed only such ordinary remedies as were suitable under the circumstances, and we have no reason to believe that the facts were otherwise. We therefore congratulate him on his being cleared from so foul a charge, and we regret to find that professional jealousy prevails so much at Melbourne, that Mr. Beaney believes himself to have been in some measure the victim of that most unchristian and unworthy feeling.

SANATORIA FOR THE INTEMPERATE.—Dr. Winslow continues, in the pages of the *Pall Mall Gazette*, to invite public attention to this important subject, and he relates several cases, both from his own experience and from published documents, showing the fatal mischief often caused by immediate indulgence in alcoholic drink. The quantity imbibed by some dipsomaniacs is quite astonishing, and almost incredible, one gin-drinker having been stated by Dr. Farn, in his evidence given before a Parliamentary committee in 1834, to be in the habit of taking seventy-two drams of his favourite liquor at one sitting, and another drunkard took half to a whole gallon of gin and brandy every day. Such persons are often moral, religious, and happy, in the intervals between the paroxysms of drinking, but when once the unhappy passion seizes them, they go on indulging their morbid propensity until they have reduced themselves to a state of utter brutality. In their lucid intervals they regret and deplore their vicious habits, and it is thought that they would readily avail themselves of the protection of sanatoria if any such institutions existed.

THE CHOLERA.

THE Registrar-General's returns for the 38th week of the year ending Sept. 22, shows a still further decrease in the deaths from cholera, which are, in fact, 32 less than in the preceding week. The mortality of London during the week exceeded the estimated average by 144 deaths, and these were more than accounted for by the deaths from cholera, which were 150. The deaths in the last four weeks have been successively from cholera, 198, 157, 182, and 150; from diarrhœa, in the same weeks, 128, 132, 110 and 98. 53 young persons under 20 years old died from cholera, and 81 from diarrhœa in the week; at the age of 20 and upwards there were 97 deaths from cholera and 17 from diarrhœa.

The distribution of the epidemic remains much the same as shown by the fact that 14 persons died from cholera and 11 from diarrhœa in the West districts; 28 from cholera and 19 from diarrhœa in the North districts; 19 from cholera and 17 from diarrhœa in the Central districts; 56 from cholera and 24 from diarrhœa in the East districts; 33 from cholera and 27 from diarrhœa in the South districts.

The annual rate of mortality during the week was 23 per 1000 in London, 19 in Edinburgh, and 27 in Dublin; 18 in Bristol, 18 in Birmingham, 52 in Liverpool, 30 in Manchester, 29 in Salford, 21 in Sheffield, 26 in Leeds, 21 in Hull, 35 in Newcastle-upon-Tyne, and 22 in Glasgow. While the deaths in London from all causes were 1350, the corresponding average of the last ten years is only 1096.4. Although there is no reason at present to doubt that the epidemic is nearly gradually disappearing from the metropolis, yet we should bear in mind that the subsidence is much more gradual than was its invasion. During the first half of July only 46 deaths from cholera were registered, while in the following week the deaths sprang up to 346; in the week after to 904. In the week ending Aug. 4, they had reached the highest 1053, and though progressively diminishing since, the number of 150 can scarcely be considered satisfactory. The success with which the invasion has been met is not yet complete, and our local authorities must not be suffered to relax their too slowly awakened energies.

THE COUNTRY.

WE have several times had to report a tendency of the epidemic to spread, and still new places continue to become infected. In no case, however, except Liverpool has there been a severe outbreak, although in Wigan and other parts of Lancashire we have been advised of a considerable number of cases.

THE CONTINENT.

FROM France, Germany, Italy, and the East, we have no news of decrease to report, but in several places the reverse. On the Mediterranean the disease still holds its ground, and at Naples we hear the increase during the week has been very rapid and the cases all of the most severe type, the mortality being consequently still higher. A correspondent, in fact, states that out of a number of cases on the Chiaia all have been fatal. We some weeks since took occasion to condemn the sanitary state of this fashionable quarter, which is at all times in a most offensive state.

From Nice we predicted last week a disclaimer. This has duly appeared in the shape of a letter from the English Consul in the *Times*. This is certainly a more reliable announcement than some hitherto made, and gives figures which in reality corroborate our previous remarks. The total deaths from cholera reported to the British Consul are 38 from the end of July to the middle of September. This Mr. La Croix (the Consul) speaks of as very small for a population of 50,000—a proposition to which we cannot subscribe, for, by a very simple calculation, it would be easy to show that, in proportion to the population, it is not inconsiderable.

AMERICA.

FROM the statements of the daily press it would appear that the disease is slowly but surely extending its area in America. Indeed it seems quite probable that the wave may pass over the whole Western world.

WOOLWICH.

WE have already described the precautions taken by the Board of Works for this district on the outbreak of the cholera. All the other parts of the metropolis had medical officers of health at the time, but at Woolwich there was none. It is admitted that in one instance, where six deaths occurred, there was some delay at first. During the last week four deaths were registered from cholera at Woolwich, and ten others in Deptford. It is only by the most vigorous action that the disease will be able to be kept under. We do not deny that prompt measures have been adapted, but we do say that these ought not to be looked upon as mere temporary expedients.

THE RIVER.

WE fully described last week the valuable work that is being carried on by the Seamen's Hospital Society. In each of the epidemics of 1849 and 1854 upwards of 200 cases were received on board the *Dreadnought*. In the present epidemic only 73 cases have hitherto been admitted to the *Belleisle*. The work has been well and ably done; but what are the Thames conservators doing to leave it all to this society? Their inspector objects to the river being used as a dust-bin, but we never heard that any of their officers had any authority over the sanitary state of the shipping. The parishes through which the river flows have no authority beyond the water's edge, and as far as our inquiries can ascertain, the Thames conservancy has not yet appointed a medical officer of health. Certainly we have a right to look to this body. The great waterway of the world's metropolis is placed under the control of a cumbrous board which suffers it to become the foulest of thoroughfares.

THE CHOLERA AND THE WATER COMPANIES.

So much has been written respecting the water supply of the metropolis as a source of cholera, and so many statements have been unhesitatingly made, that we feel it a duty to commend to our readers an unprejudiced consideration of the facts that have been proved, and urge upon them the necessity of dismissing from scientific consideration all mere theories. We ourselves have placed before them, in such terms as seemed to us justifiable, the strong case against one of the London companies, and we cannot hesitate to repeat our opinion that the monopoly of them all should be for ever abolished. When water is supplied which is declared to have come direct from the filter-beds to the consumer, and eels nine inches in length are found in the pipes—others still longer, thirteen inches; and mussel shells to the extent of a bushel come out of one main—what is the natural conclusion? Further, when a company urges that although it possesses a communication with the river supplying it, besides that leading through the filter-beds, but that this it never used "*except in case of emergency*," we consider that its condemnation is pronounced by this confession. There is no reason why the public should pay an enormous price for inferior water, nor run the risk of the most deleterious contamination to keep up a monopoly that ought never to have been granted.

The figures we have above given contain lessons that the profession will not be slow to learn. Even had we space on this occasion it would not be necessary to attempt to deduce from the table all that it teaches. The figures of so efficient a public department as that of the Registrar General will be regarded with the respect they deserve. In point of fact, they cannot be gainsaid.

BEDFORD'S COD-LIVER OLEINE.

THIS substance, which has quite lately been introduced into medical use, is of a very light colour, has scarcely any smell, and is almost tasteless. We have tasted it ourselves and given it floating only on water to several persons, and we find that it is free from any disagreeable flavour, and indeed, as we have just mentioned, it possesses hardly any taste whatever. The Messrs. Bedford, in introducing it into notice, observe that the qualities rendering cod-liver oil generally objectionable are its dark colour, fishy odour, and rancidity and pungency of taste, and they explain how these disagreeable qualities are acquired. They maintain that the best oil may be quite destitute of colour, and that it ought never to be of a deeper shade than light amber or straw colour. The rancidity of some cod-liver oils is due to the presence of fatty acids developed by oxidation, and they ought never to be present in any specimens, even in the heat of summer. They render the oil irritating to the stomach, and provoke nausea, and sometimes, it is said, they produce diarrhoea. The external qualities of good cod-liver oil are, therefore, pronounced to be lightness of colour and freedom from fishy odour and rancidity; but it is said, moreover, that the best oil is that which has been thoroughly freed of *margarine*, one of the ordinary constituents of fluid oils together with *oleine*. Why the *margarine* is objectionable we are not informed, but whatever may be the reason for its removal, the Crystal Cod-liver Oleine contains none of that principle. Messrs. Bedford disclaim for this oil any specific curative virtue over other first-rate specimens of the article; but they urge that it possesses all the therapeutic virtue of any other similar oil, while it has properties of its own which render it peculiarly advantageous. Our own opinion, as we have already stated, is favourable as to its qualities.

DEATH OF DR. WILLIAM STAMER STANLEY.

WE are concerned to announce the death of this very estimable gentleman and respected member of the medical profession, who expired at his residence, Orchardstown House, Rathfarnham, on the evening of the 26th ultimo, of bronchitis, in the fifty-sixth year of his age, deservedly regretted by his many professional and other friends, to whom his amiable and gentle disposition and sterling good qualities had much endeared him.

The deceased was son of the late Sir Edward Stanley of this city (Dublin), and brother of Edward Stanley, Esq., Secretary of the Meath Hospital and County of Dublin Infirmary. He had been ailing periodically for years, and bore his sufferings, which were at times very great, without a murmur.

Doctor Stanley was a Licentiate of the King and Queen's College of Physicians in Ireland, and Member of the Royal College of Surgeons of England. In the early part of his career he practised his profession in England; subsequently, for many years, and at the time of his death, he was proprietor of a private Lunatic Asylum, to which he devoted his time and talents with much success, in ministering to the wants, and assuaging the sufferings of the afflicted class committed to his care.

We understand that the establishment (Orchardstown House, Rathfarnham), is to be continued for the benefit of the widow, and son and daughter of our departed friend, under proper medical supervision, and we have no doubt that the medical brethren of one so worthy, will kindly lend a helping hand, as opportunity may offer.

Dr. Stanley had written several excellent papers in the

Medical journals, on insanity, epilepsy, paralysis. &c., and during the last year, an interesting essay, entitled "Thoughts on Mind and its Derangement," productions which bear evidence of a highly cultivated mind and refined feeling. Its end was peace.

MORE WORKHOUSE REVELATIONS.

THE noblemen and gentlemen who have interested themselves in the question of the administration of the Poor-law to the sick poor of the metropolis have just had their attention drawn to the management of the Lambeth Workhouse. The mismanagement alleged comprises charges of insufficient medical attendance for the sick, cruelty to inmates, and the exercise of illegal punishment. All these charges are supported by instances. In the first place, the medical officer of the workhouse declared he wanted a qualified assistant. He stated to the Poor-law Board that the dispenser, who was unqualified, was also superintendent of the male infirmary, and acted as assistant in operations, and added, "In times of my occasional illness and absence, I have sorely felt the need of a qualified assistant who could represent me, and there is employment in this infirmary for such a gentleman, under my superintendence." The Poor-law Board brought this want before the guardians, who resolved to deal with it, and their manner of dealing with it will doubtless appear a grim jest. After due deliberation they came to the agreement that the medical officer, who had about 4000 patients in a year in the workhouse, ought to have assistance, and they proceeded to fill up the vacancy thus created in the medical attendance of this large house. There had been in the house for some years an old man, now upwards of seventy-five years of age, who, in Lambeth guardian parlance, had been in "the medical line." Without inquiring what were the causes of a man who had held a position as a medical officer becoming a pauper, it is sufficient to say that at this time he was feeble in body and mind. The guardians wanted to give the medical officer assistance, so they put the old man in a suit of black, and promoted him to be the deputy medical officer over about 400 sick persons, and he actually professionally assisted the medical officer. In order, however, that he should remember his position, this deputy medical officer went at one o'clock every day, and took his rations as a regular inmate. The Association for the Improvement of London Workhouse Infirmaries heard of it, and Mr. Ernest Hart, the honorary secretary, addressed remonstrances to various parties, and the guardians have been obliged to relieve the medical officer of the auxiliary with which they had supplied him. The old man has been relieved of his black suit, and sent back to his ward. Complaint has also been made that an aged inmate (over seventy), only three days out of the infirmary, on expressing himself as unable to carry the rations up many flights of stairs as he had been ordered, was "black holed" for twelve hours. This "black hole" is described as an abominable dungeon, communicating with a foully-smelling closet. This is the case of cruelty referred to, and it is stated that if the Poor-law Board hold an official inquiry into the management of the workhouse more startling details will be brought to light.

There is one other matter which will be included in the programme of the expected official inquiry and that is, the management of the midwifery department. It is stated that this is greatly and cruelly neglected, as out

of forty-seven births the midwife was only present at something less than ten.—*Sunday Gazette*.

EXPERIMENTS IN MEAT PRESERVING.

TO THE EDITOR OF THE SCOTSMAN.

SIR,—“Animal diet” being considered by all men, except “mild Hindoos” and other vegetarians, as a necessary part of human food, any means by which its natural tendency to decay can be retarded, or rendered subservient to the will or even the caprice of man would, no doubt, prove a great public benefit. Some experiments in this direction have, it appears to me, solved this important question, and lead to the conviction that this object may be attained by a very simple and fortunately inexpensive process, and that in spite of considerable disadvantage in respect to climate.

The plan adopted was “sulphurous fumigation,” slightly modified and so managed that there existed *constantly* a strong taint of sulphurous acid gas in the atmosphere; and this was secured by either burning sulphur, or by mixing “sulphite of soda” with diluted vitriol in the chamber, *all but unavoidable access of air being carefully guarded against*.

This agent was employed in the belief that the germs of decomposition, like those of many diseases, are located in the air around us, and are equally amenable to this their greatest enemy; and, accordingly, the results have gone to confirm the theory, and prove that without the *actual* presence of *living* species the process of decay *cannot* go on.

In order to test this the more thoroughly, however, I selected an *attic* room, had it made as air-tight as possible, and found that the temperature at *midnight* was 66°, while *during the day* it ranged about 70°. There I hung up several grouse, a *skinned* rabbit, two legs of mutton, a piece of beef, veal, beef-steak (cooked), and a slice out of a roast “gigot.” They have been in my possession for periods varying from three weeks to eight days, and, as slices from them at this moment attest, they are entirely free from taint or odour. As a comparative test, one grouse, which arrived from Ross-shire along with the others, was put into the larder as usual; in five days, it was unfit for use, and had to be put aside. The mutton, from which the slice was cut, was cooked upon a Saturday; by the following Tuesday the remainder was stale; the slice is to-day dry, but as sweet as need be. The rabbit, hung for eight days, was then cooked in the usual way and at this moment the *débris* is dainty enough for anybody's eating.

These facts, though easily attained, will lead to practical results of infinite value, and enable us to draw our supplies *fresh* from sources whence we have hitherto been debarred by climatical difficulties long groaned under as impossible.—I am, &c.

JAMES DEWAR, M.D.

Kirkcaldy, September 4, 1886.

CHARGE OF FRAUD AGAINST A MEDICAL ASSISTANT.

At the Marlborough-street Police Court, last week, W. A. Hill, a medical assistant, was brought before Mr. Knox, charged with offering himself to Mr. Saul, surgeon, of Charlotte-street, Fitzroy-square, pretending that he had served in a capacity in which he had not actually so served. Mr. Saul in November last advertised for an assistant, and in answer received a letter from the prisoner. The prisoner gave him the names of Mr. Capper and Mr. Newton as references. Mr. Saul wrote to them, and in answer received letters speaking in the highest terms of the prisoner; but the letters were written by the prisoner himself. Mr. Saul engaged the prisoner, and the prisoner was not more than two hours in Mr. Saul's service when his conduct became most extraordinary. Mr. Saul having kept a watch on him noticed that the stock of spirits of wine in the surgery decreased, and at twelve o'clock at night the prisoner was found to be quite drunk. An attempt was made to eject him from the house, and in doing so he assaulted a lad in Mr. Saul's service, and he was brought to this court and fined 20s. Mr. Knox said: You will escape conviction simply by a nicety in the Act of Parliament. Luckily for you the period of six months mentioned in the Act has expired, and therefore my power of acting, I am sorry to say, is gone. You get into a situation by means of a false character—a part of your duty being to mix drugs—and you then get intoxicated. You are a nice person to be a medical assistant. I shall discharge you, but most reluctantly.

Correspondence.

THE FIELD HOSPITALS OF THE PRUSSIAN ARMY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Having spent two months amongst the Prussian lazareths in Bohemia, as it may be interesting to some of your readers, I shall endeavour, with your permission, to give some account of them, and of the other arrangements for the relief of the wounded in the late war. In times of peace the Prussian army is supplied with surgeons in very much the same proportion as our own; in war time, however, the Government is able to obtain aid to an almost unlimited extent from the ranks of the medical men settled in private practice in the different parts of the kingdom. Each surgeon-general has a list of the medical men practising in his district, and if the Government requires a number of surgeons from that district, he calls them from his list, commencing with the youngest. These surgeons, then, for the time of the war, have the same rank and pay as military surgeons, and must serve with the army; when war is at an end they return to the practice they have left. By this means the Prussian Government can obtain an abundance of surgeons at a moment's notice to supply the immense masses it can put upon a war footing, while at other times a much smaller supply is sufficient. It is not, indeed, a plan which would answer for our army. I can, however, truly say, that of the many men who were thus serving for the war with whom I was acquainted, there was not one who complained of the necessary loss and injury to his practice; but while they naturally regretted this, the universal feeling was that the people must so work together, if they wished their nation to become great and prosperous.

In a campaign a lazareth is a company of surgeons with their apothecaries, hospital attendants, &c. There are light and heavy lazareths. A light lazareth has one over staff-surgeon, four staff-surgeons, and eight assistant-surgeons, with two field apothecaries, and eight lazareth attendants, and is organized for the reception of 200 patients. The duty of the light lazareths is to follow close after the army on the march, and when an engagement comes off to afford the first assistance to the wounded on the field of battle, to perform the operations which require to be made immediately, and to take charge of the wounded until they can be handed over to the heavy lazareths which follow more in the rear. Part of the light lazareth goes over the battle field and gives aid to the urgent cases, placing the wounded in waggons or on litters to be transported to the *Perbandplatz*, where the remainder of the lazareth remains, and where further assistance is rendered. Its duty being completed, the light lazareth proceeds on the march after the army. A heavy lazareth is composed of one over staff-surgeon, three staff-surgeons, ten assistant-surgeons, and three apothecaries, with fifteen hospital helpers. Its duty is to receive the wounded from the light lazareth, and to treat them until they can be moved to their homes, or to the temporary war hospitals established in different parts of Prussia. The heavy lazareths are each arranged for the reception of 600 patients. They always establish their hospitals in some neighbouring town or village, or if near a gentleman's country seat, they take possession of it. The Knights of St. John provide tents also, each of which accommodates twelve or fourteen patients. The surgeons who were attached to the lazareths were, with a few exceptions, those temporary military surgeons of whom I have spoken, while the permanent army surgeons were immediately with their regiments.

In the late war the Prussian army consisted of twelve army corps, each corps numbering from 25,000 to 30,000 men,

to each of these were attached three light and three heavy lazareths.

In order that the wounded might have every advantage to promote their recovery, the most eminent professors of surgery in the universities of Prussia were present at the seat of war.

Langenbeck and Wihlms from Berlin, Busch from Bonn, Middeldorp and Klopsch from Breslau, besides several others. With the rank of surgeon-general each of these professors had a district including several heavy lazareths, their duty being to drive about from one to the other, and give advice in all difficult cases and to perform the more difficult operations.

One of the most remarkable features of the late war was the voluntary aid afforded by every class of the Prussian community; of this I cannot possibly give you any adequate idea. There was not a town or a village which did not exert itself to the utmost to send presents of all sorts to its wounded soldiers. Beds, clothing, wine of every sort, cigars, tobacco, bandages, scharpee, coffee, &c. &c., everything and in abundance. You might see bottles of the best wine labelled, *den tapfern kriegern*, and boxes of everything useful and necessary, directed to "the brave soldiers of the —th regiment, from the inhabitants of ——" The Knights of St. John were amongst the most conspicuous of those who gave their voluntary personal assistance at the seat of war. They are an order revived from the time of the Crusades by the late King of Prussia. The object of the order is to provide for the wants of the wounded in case of war, in whatever manner the occasion may demand. The members are all noblemen. In the late war their chief business was to direct the voluntary supplies to the lazareths which might require them, and this they did to admiration. They also provided many things at their own expense, as, for example, the tents for the wounded, which I before mentioned.

The element of womanly care was not wanting. Many ladies of high rank attended to the wants of the sick with the greatest assiduity, and an order of Sisters of Charity from Bonn were unceasing in their efforts, exposing themselves to the danger of cholera equally with those whose duty obliged them to do so; many of them, indeed, falling victims to it. Students from the different universities were there; 112 came from Breslau alone, and made themselves really useful, for they never thought themselves above any sort of work.

There were also many volunteer surgeons, both Prussians and foreigners, and even volunteer hospital attendants.

In short, the wounded were cared for as well as any one could wish. *I never heard a complaint*, although in the lazareth with which I was best acquainted there were 520 patients, and of these 456 were Austrian soldiers. Breakfast (coffee with bread and butter) was served in the morning at seven o'clock, at about ten a cup of chocolate, at twelve, dinner (soup, meat, and bread), at three a large slice of bread and butter, and at six, supper (meat and bread). Each man also got three or five cigars a day, and these for a wounded German soldier are as necessary as any other part of the treatment. Austrians and Prussians were treated precisely alike, and the gratitude of the Austrians was unbounded. The only instance of ingratitude I know of, was an Englishman, a major in the Austrian army, who was slightly wounded at the battle of Konigratz. The remark he wrote, on leaving, in the visitors' book at Hredeck castle at that time a Prussian lazareth, was, "God save Austria; and d—n her enemies." I have not had much opportunity of judging of Austrian surgery; but it is a fact, that both officers and men dreaded the advent of their own surgeons and after the peace was arranged, when the time drew near that the Austrian surgeons should take charge of their own wounded, I have often heard such remarks as these: "It

would be much better for us, doctor, if you would stay here." "Don't leave us to our own surgeons, take us with you to Prussia."

I believe there was only one time at which the supply was not equal to the demand. It was after the battle of Konigratz. This, however, is not to be wondered at, if you remember the very quick progress of the Prussian army, and the consequent difficulty of bringing sufficient supplies, and then the immense carnage at that battle, in which there were about 500,000 men engaged. It took place on the 3rd of July, and on the 7th the last of the wounded were brought in from the battle field, and these men had lived for four days without anything to eat, and their wounds unattended to, and yet several of them survived. Then, too, the Prussians had to take charge, not only of their own wounded, but also of their enemies; for the Austrians in their precipitate flight could not of course take their wounded with them. An Austrian surgeon told me that most of the wounded they had in Vienna from this battle were those who could run themselves, being only slightly wounded in the hand or forearm.

At the close of the war the corporations of many towns in Prussia came forward and offered to take charge of the wounded; many private individuals, too, made the same offer.

I would gladly recount to you some of the interesting cases I saw, but I feel that it would be rather beside my present object; and, moreover, I know that they will be published by others in a much better manner than I could do it. I shall, therefore, only make some remarks on the surgery in general. The great feature of it was the plaster-of-Paris bandage, which was applied in almost every case of fracture, although they were all compound and nearly all comminuted, and the conical ball of the Prussian *Zundnadelgewehr* does produce frightful comminution. If I might express my own opinion of the plaster-of-Paris or gypsum bandage, it would be: the gypsum bandage is undoubtedly the best apparatus in almost all cases of simple fracture, although compound; it must of course be put on with care, the bones having been reduced to their proper position, and the limb being held steadily by two or more good assistants during the application. By means of the gypsum bandage you obtain a *permanently* good position of the limb, perfect rest of the fragments, and perfect freedom from pain on the part of the patient; and I really do not know of anything more to be wished for. The freedom from pain which a patient with a broken limb, to which a gypsum bandage has been applied, experiences is very remarkable, and a great argument in favour of its use. In case of fracture of the thigh all the annoyances of straps, long splints, and perineal bandages are avoided.

In cases of comminuted fractures, however, I do not think the gypsum bandage is so desirable. It is not that the bandage itself produces any mischief, but I think it prevents the surgeon from being aware what mischief is going on in the limb, which he might otherwise take measures to remedy. I do not think that the small hole left in the bandage opposite the wound allows sufficiently of those examinations which must be constantly made in cases of comminuted fractures; yet I must confess I have seen many such cases treated with the gypsum bandage successfully. After excisions of joints it is an admirable apparatus.

The following was the mode of applying the bandage, for example, in fracture of the thigh:—The patient must be raised completely off the bed by assistants and held steadily in this position. The fracture is reduced and extension applied. A long flannel bandage is passed three or four times round the pelvis, and then continued down the thigh and leg, and round the foot; then a linen or coarse gauze bandage into which the gyps has been well rubbed (dry) is applied in the same manner as the flannel one, an assistant

following its application with a wet sponge, squeezing the water on it. After this a board (about nine inches or a foot broad) is placed under the thigh and leg, and the patient laid upon his bed; then the gyps mass, of about the same consistence as for making casts, is applied thickly all over the front and sides of the limb, and over the front and sides of the bandage which goes round the pelvis; it need not be applied behind were the board is, it need only be very thick in the groin. When it has completely "set," a hole is cut in the bandage opposite the wound, and through this the wound is afterwards dressed. I think it is quite possible, with a properly applied gypsum bandage, to cure a broken thigh with as little shortening as by any other apparatus. In cases of swelling, great suppuration, or acute inflammation, it is of course not applied. In fracture of the leg the bandage extends from above the knee to the foot which it encircles; no board is placed behind, but the gyps is applied instead. If it be wished to have the bandage waterproof, this can be effected by painting it with a solution of dansar resin. Care must be taken not to put on the bandage too tight. The great difficulty, and a most important point in its application, is to have good assistants.

There were many cases of tetanus for which the treatment was subcutaneous injections of morphia. I do not think it a very powerful remedy.

Cholera made frightful ravages in the Prussian army when all the fighting was over. I know of only one lazareth which it did not visit; everywhere else it was very severe. In Bidzova, where there were only 150 patients, 50 of them had died of cholera when I last heard, and it is probable more died afterwards. Brunn, however, was its head quarters. My friend, Mr. Salaman, spent a month there, and he tells me that the average of deaths was 1 in 4 of the cases. The treatment was various. For diarrhoea, tincture of opium, nitrate of silver, tannin, or the mineral acids; for vomiting, nitrate of silver, ice, or hypodermic injections of morphia; for cramps, sinapisms, frictions with spiritus sinapis, or linimentum volatile. In one hospital the general treatment was a mixture of tincture of opium, tincture of valerian, and tinct. sp. etheris nitrosi, in equal parts. The patients got a great deal of Seltzer water to drink. In many cases typhoid fever followed the cholera closely; most of these cases died. The treatment was muriatic acid. The most minute attention was paid everywhere to cleanliness, disinfection, and ventilation. The disinfectants used were permanganate of potash or soda, and sulphate of iron.

Mr. Salaman has told me the curious fact that the patients at Brunn used to eat an enormous amount of salt herrings during convalescence.—I am, Sir, your obedient servant,

H. R., M.B., L.R.C.S.I.

Karl's Strasse, Berlin.

BLOOD-POISONING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I quite coinciding with the views stated by Mr. Travers in his paper of September 5th, that there never were pus globules circulating in the blood, it may be supposed that we have been led into error by loosely using the word blood-poisoning and pyæmia, and coupled them together as if they meant the same.

The new coin struck in the word "Pyæmia" certainly means pus in the blood. Now, if there is no such thing, and the word pyæmia has been formed erroneously, we ought to do away with it altogether as a base coin, for it conveys a wrong impression, and is not only of no value, but is positively injurious and prevents our arriving at the truth. We then will suppose the offending word obliterated and done away for ever.

Mr. Travers plainly says that certain salts—albumen and fibrin—easily become incorporated with the fluid contents of the heart and arteries. Now, of course these both alter and deteriorate the blood, and the tissues to be nourished from blood of the weaker character are feeble in comparison with those nourished better by more healthy blood.

Following upon this weak state, abscess is rapidly formed, and indeed a great deal of the practical art of medicine, as to its success, depends on getting into the circulation blood of a healthy quality to support and supply the economy. If we interfere with the necessarily weakened digestion or eliminative process, we hasten rather the decadence of structures, which it is our object to repair; thus the line of treatment is marked very lightly and must be adhered to very implicitly.

But suppose we have to consider blood disorder and take up any simple form of that large class of which certainly originate in diseases of blood, I mean skin diseases, or other diseases which appear on the skin, but which, as far as we can trace them, to some internal disorder explained on the surface of the body.

Now, eczema is evidently a state of weak and inflammatory blood, and the circulation is loaded with unhealthy products of indigestion. Now, in the nature of blood diseases and skin diseases it is evident you cannot go very far in one direction without injury from treatment.

The successful treatment of blood inflamed or blood diseased involves great variation in management, and while on this subject I think change of plan is always important, and have to recommend an occasional course of warm water treatment, judiciously managed, at a hydropathic establishment. There must be sufficient health in the constitution, but this, combined with plenty of exercise and light good food forms one of the best measures for renovating the strength. In former days cold water only was used in these establishments, but now the temperature of the bathing is regulated to tepid or warm or hot. Supposing this has not succeeded, still medicines may again be prescribed, and by these interchanges successfully employed.—I am, Sir, your obedient servant,

M.D.T.C.D.

September 29, 1866.

THE CHANGE OF TYPE QUESTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—If your correspondent who, in your last number, signs himself "A Disbeliever in Change of Type," will show what he is worth by giving his name, he will likely find some one to answer him, and show him the question is neither obsolete nor a thing of the past. But as he has been the thrower down of the gauntlet on this occasion, he must give his reasons for his own views, and he must not write in an offensive tone, such as his letter, already published, affords an example.—I am, Sir, yours,

HENRY KENNEDY.

MALPRAXIS BY A BONE-SETTER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I was called on at an early hour this morning to visit a young lad who, ten days since, received a fall, fracturing the lower third of right humerus obliquely, running into the elbow joint; the end of fractured bone protruded, lacerating in its exit the brachial artery, and producing, as I have been informed, very great loss of blood.

A bone-setter in the neighbourhood—or as such are generally termed "skilful men"—was called upon, who bound the arm up tightly about the seat of injury, neglecting altogether the forearm and hand, and causing complete arrest of circulation, and consequent gangrene of the limb. When I saw the case this morning the hand and forearm were entirely sphacelated, and nearly separated from the humerus. Of course totally destroyed, and the poor boy maimed for life.

I now require to know from you is there any law in existence to prevent those ignorant persons from pursuing such practices to the great destruction of human life and limbs, and pecuniary injury to regularly educated medical men. Your reply in next issue of THE PRESS will much oblige your obedient servant,

J. W. SWAN, Surgeon,
Medical Officer to Dispensary.

Ballyragget, September 27, 1866.

THE RECOVERY OF MEDICAL ACCOUNTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I shall be glad to know, if you or any of your readers can inform me if, under the following circumstances, I have any redress, or how a medical man is to prove his debts in a county court. Yesterday I had occasion to press for payment of my account from two patients, both had been served with bills for an old attendance, and both subsequently with bills for a fresh and the old attendance together. They both meet me in court with their old bills, swear they have had, and owe for, no other attendance; and his Honour turns round to me and says, "Prove it." I replied, "My books and my word are all I have." His very curt reply is, "I don't believe in books, their word is as good as yours;" and I am non-suited in both cases, except for the old accounts. Now, Sir, if this is justice the less a man has to do with it the better. My assistant, who I suppose might have proved the debt, is in Cornwall, and has been there for nearly three years, and of course no one ever thought his presence would be necessary in a case of this sort. Thus, Sir, I lose about £4 by a false statement, and I am told that I have no redress. It is high time some alteration were made either in our county court, laws, or judges.—I am, Sir, yours, &c.

W. C. C.

WHAT EFFECT HAS THE MIND OF THE MOTHER ON THE FŒTUS IN UTERO?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—A lady, a particular friend of mine, had occasion to leave Dublin last summer for a few weeks, and having a favourite cat, and fearing to lose Grimalkin in her absence, she committed it to the care of an old lady in the city who is known for her love to the feline race, which love manifested itself in the fact that on the death of her last tabby, she had the skin of it carefully stuffed and placed on her side-board; moreover, said tabby was a Manx cat, or, in other words, a cat *sine cauda*, rather a rare animal in Ireland, and only occasionally met with even in the Isle of Man.

When my friend returned to town her cat was brought home, and in a condition likely soon to add to the feline family. In fact, in a few weeks after four fine kittens were found one fine morning in the kitchen, and, strange to say, two of them were *tail-less*, the very picture of the stuffed cat on the side-board, to which they certainly could not owe their paternity.

My object in bringing this under the notice of your readers is to elicit information on that important physiological question, "What effect has the mind of the mother on the fœtus in utero?"—Yours sincerely,

J. M. L.

"POOLE FUND."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Will you kindly insert in your next number the enclosed replies, which are a few out of many I have received?—Faithfully yours,

C. ARMSTRONG, Hon. Sec.

Cork, September 15, 1866.

"MY DEAR ARMSTRONG,—I enclose ten shillings for the payment of legal expenses incurred by Dr. Poole in his defence, and hope the members of the profession will

respond as they should, particularly Poor-law Medical Officers.—Most faithfully yours,

“THOMAS L. MACKESY.

“Waterford.”

“MY DEAR ARMSTRONG,—I enclose ten shillings, my subscription for the ‘Poole Fund,’ and were it not limited to this sum, I would gladly give more. I was present at the trial, and never witnessed a more infamous transaction.—Most truly yours,

“PHILIP WALSH.

“Middleton.”

“TO DR. ARMSTRONG,—For Dr. Poole’s List, ten shillings. Surgeon FLEMING, Fourth Dragoon Guards.

“With best wishes for success.”

“DR. TWEEDY encloses ten shillings for the cause of Dr. Poole, whose case deserves our warmest sympathies as Christians, as physicians, and as gentlemen.

“Dublin.”

“DEAR SIR,—I have great pleasure indeed in bearing part with your Association in the endeavour to reimburse Dr. Poole for his expenses.—Most sincerely,

“J. H. WHARTON.

“Dublin.”

“MY DEAR ARMSTRONG,—Your Association deserves much credit for taking up the ‘Poole Case’ so promptly. Do the medical men only unite in that way, no fellow would dare bring such an action against a benevolent and skilful physician. I enclose ten shillings.—Yours faithfully,

“Bruff.”

“SAMUEL BENNETT.

METROPOLITAN POOR-LAW MEDICAL OFFICERS’ ASSOCIATION.

REPORT OF THE COMMITTEE OF COUNCIL APPOINTED TO CONSIDER AND REPORT UPON THE REPORT OF DR. EDWARD SMITH ON THE METROPOLITAN WORKHOUSE INFIRMARIES, ETC.

At a meeting of the Council, held at Soho-square, London, on Tuesday, the 31st July, 1866, the report upon “Metropolitan Workhouse Infirmaries,” &c., by Dr. E. Smith, Poor-law Inspector and Medical Officer to the Poor-law Board, having been further considered, a Committee, consisting of the officers of the Association, was appointed to draw up a report upon the same, to be submitted to the council at the following meeting.

“At a meeting of the Council, held on Tuesday, the 7th of August, 1866, the report of the committee having been read, was approved, and ordered to be printed.” Extracted from the minutes. T. ORME DUDFIELD, M.D., Hon. Sec.

The Poor-law Board having sought the opinions of the medical officers upon this vital question, a large proportion of them recommended 1000 cubic feet and 80 feet of floor space per bed—as a minimum (the cubical space allowed in general hospitals ranges from 1200 to 2500 feet per bed). Dr. Smith would be contented with 500 cubic feet per bed, affirming that that amount, with proper ventilation, is sufficient to secure an atmosphere equally pure with that of general hospital wards.

But your Committee cannot subscribe to Dr. Smith’s *dictum* upon this question, and they have to offer the following objections, *in limine*, to the experiments upon which it is based:—

a. That they were essentially inexact, inasmuch as no account was taken either of the total amount of air passing through the wards in which the experiments were made, of the rate of movement either at the apertures by which fresh air entered or foul air escaped, or of the total size of ventilating apertures provided, per bed.

b. That the mere fact (supposing it correctly stated) that the patients did not find the ventilation disagreeable or hurtful, is worth nothing, because the trials were made in warm weather. The same ventilation in winter would have been very different in its effects on the patients.

c. That the class of inmates of these wards is not described. They may have been simply infirm or chronic patients, and may have borne, without serious injury, an amount of movement of air which would have been dangerous or fatal to the subjects of bronchitis, pneumonia, and kidney disease, and many other complaints which are commonly seen in workhouse wards.

d. That the experiments took no account of the amount of organic matter in the air—a vital point.

However, it may be well to take Dr. Smith’s own account of the results of these experiments. From this we find that the mean amount of carbonic acid in the atmosphere of the wards examined was 0·0568 per cent. by day, increasing to 0·0780 per cent. at midnight, and 0·0802 per cent. at five a.m., a proportion which is more than double that found, on the average, in the external air, and really represents a dangerous degree of impurity for sick wards. The state of the atmosphere of sick wards at night, is the true test by which their ventilation should be tried; an average of the condition during both day and night, which Dr. Smith takes as a standard, cannot be considered as such.

From the experiments made at Aldershot, and at Netley, it can be proved, beyond question, that (with an allowance of only 500 cubic feet per bed) in order to have reduced the carbonic acid, even to the unsatisfactory standard obtained in Dr. Smith’s experiments, it must have been necessary to change the whole air of the wards *four times per hour*; and we venture to affirm, both from our own experience and the universal testimony of authorities, that this cannot be done without creating dangerous currents, except with the help of an elaborate and most costly apparatus, and a numerous staff of assistants.

We consequently renew, with even more urgency than before, the appearance of Dr. Smith’s report, our demand for 1000 cubic feet and 80 feet of floor space per bed.

But your Committee rejoice to observe, that although Dr. Smith maintains the sufficiency of 500 cubic feet per bed, and argues throughout as though this were to be the standard in the future as in the past, he does by implication, recommend a much larger allowance. He indicates a pattern ward, and your committee agree that such a ward would fairly meet the requirements of space. This ward, 60 feet in length, 20 feet in breadth, and 12 feet in height, with windows on both sides, will, he says, allow of 20 beds (ten on either side) and afford 60 feet of superficial area to each bed.

Such a ward would, indeed, afford 60 superficial feet to each of 20 beds, if it contained nothing else, and 720 (not merely 500) cubic feet; but it is certain that 20 beds could not be placed in it if the recommendations of Dr. Smith, as to the width of the inter bed-spaces—*viz.*, 3 feet (or 6 feet per bed, laterally including the interspace) were to be carried out (and less than this it would be very unsafe to grant). Unless, indeed, the ward should be deprived of both fire-places, and of the greater portion of the furniture which Dr. Smith very properly declares to be necessary.

Instead of 20 beds, with 720 cubic feet each, there could not be more than 16 beds (according to Dr. Smith’s own showing) which would allow of 900 cubic feet per bed.

It will thus be seen that there is a substantial agreement between the medical officers and their colleague of the Poor-law Board as to the arrangement of beds in a ward, but that this requires twice the cubical contents which his ventilating experiments have induced him to suppose sufficient.*

VENTILATION.

The subject of ventilation, so intimately connected with cubic space, has been dealt with to a considerable extent in the previous section.

But with especial reference to Dr. Smith’s remarks upon this all-important question, we observe that he appears to argue as if the medical officers had only asked for larger cubic space (“which may mean only dilution of the poison,”) and not for larger cubic space, *plus* the most efficient ventilation that can be obtained;—ventilation of a character to be out of the control of the inmates, constant in operation, and, if need be, with provision for warning the admitted air. This assumption is entirely gratuitous.

It has struck your Committee as not a little remarkable, that Dr. Smith appears almost entirely to ignore the importance of the organic products emanating from the human body, and more especially those subtle animal poisons which, floating in the air, are the cause of the spread of contagious diseases, more particularly in sick wards, allowing small cubic and floor space.

But what is the system of ventilation recommended by

* We notice in some of the special reports contained in the Appendix, that Dr. Smith recommends 600 to 700 cubic feet per bed in wards to which day rooms are attached. If 500 cubic feet per bed can be made sufficient for sick wards occupied by day and by night, why allow more, seeing that the demands upon workhouse accommodation are so urgent.

Dr. Smith for such a ward as we have previously described? It consists of one iron air-brick, size not given, above and below for every four feet of wall space—i. e., sixty apertures in the side walls (to say nothing of the end walls), each communicating directly with the open air in a ward sixty feet long, and containing twenty (or, as your Committee have shown, more properly fifteen or sixteen) beds. The ventilators are to be kept open and only modified by the use of perforated zinc on the inner side.

SYSTEM OF NURSING.

Another important question is the number of nurses required. At present there are about 130 nurses distributed over the forty workhouses in the metropolitan district, of whom nearly one-half have been appointed for the first time during the last twelve months, and Dr. Smith considers that 130 more are "immediately needed," making a total of 260, or (in the proportion of two day nurses to one night nurse) 173 day nurses and 87 night nurses—i. e., about one nurse to 35 patients by day, and one to 70 by night;—supposing, which is not probable, that the nurses are equally spread over the various infirmaries in proportion to the relative number of inmates in each.

We think this number is insufficient, even if the paid nurses should devote their entire services to the care of the 6000 actual sick; and still more so if, as we think, in common with Dr. Smith, that paid nurses should be employed at least to superintend the nursing of the aged and the chronic cases in the infirm wards.

THE MEDICAL OFFICER.

And first, "As to duties."

Dr. Smith, without adducing any evidence in support, says that, "The idea prevails too generally, that the attention of the medical officer is due to the sick only." He believes that "the medical officer does not occupy that position as sanitary officer which is indicated by the consolidated order, and which would be very useful to the Guardians." Again, "the medical officer should consider as in his department . . . nursing, diet, serving of food, classification of inmates, supply of furniture and clothing, and cubic space, and should not fail to advise the Guardians, and point out defects, on suitable opportunities." Once more, he says, "Many will doubt whether the medical officer has in all cases fully discharged his duty in reference to the existing defects. Some of his duties involve scientific and technical knowledge, such that no Board of Guardians could be expected to possess; as, for example, ventilation, cubic space, and dietary." And then he quotes Article 207 of the consolidated orders, which defines the duties of the medical officers.

That the medical officers have not done their duty is a very serious charge, which should not have been suggested without strong confirmative evidence. But what says Dr. Smith himself in another place? "I do not doubt that in many cases, representations may have been made in reference to these defects, and they may not have been suitably noticed by the Guardians." And again, he further says, "It is not possible for me to know how far the medical officers have been consulted by the guardians, or with what energy they into a sick ward," as if they had not "remonstrated with the Guardians." But when Dr. Smith urges that they should communicate with the Poor-law Board in such cases, he ignores one of the great difficulties under which they labour. By the adoption of such a course as he recommends, they would only injure themselves, perhaps irreparably, with their own Boards, without, under existing circumstances, effecting much, if any, good.

We should also hail with satisfaction any means—and such might easily be found—whereby the amount of clerical work imposed upon the medical officer might be diminished.

CONCLUSION.

They cannot, however, but feel that, while his report is, have pressed their recommendations."

Had Dr. Smith's knowledge of the Boards of Guardians been more extensive, he would have known of how little avail it has been to press upon them "scientific and technical knowledge . . . respecting ventilation, cubic space, and dietary." He would have known that it has too often happened that the most energetic and faithful of the medical officers have incurred the ill-will of their respective boards, and unmerited odium and unpopularity, by doing their duty in these respects.

The medical officers are censured by implication, for "permitting beds in excess of the proper number to be introduced in many respects, wanting in justice to the medical officers as a body, they also have reason, from facts brought to their knowledge, to object to the manner in which some, at least, of his personal inspections were conducted; and the persistency, and in some instances, the scant courtesy, with which his peculiar views as to cubic space and ventilation were pressed upon individual medical officers." They regret that he should have so completely ignored the extreme difficulties, disadvantages, and discouragements under which the medical officers have hitherto laboured in carrying out their arduous and ill-requited duties.

Finding themselves now, for the first time, openly consulted upon questions of management and hygiene, and the Poor-law Board having manifested a disposition to open afresh those general principles which they had previously laid down as guides by calling for the opinions of the medical officers, they cannot consent, without protest, to see their opinions uncourteously dismissed as of no value, because they do not agree with those of Dr. Smith.

PHARMACEUTICAL ETHICS.

IN a very able paper on this subject, read at the third annual meeting of the British Pharmaceutical Conference at Nottingham, Aug. 22nd, the following remarks are made on Medical Ethics and the behaviour of the Pharmacist with regard to the Medical Profession:—

"Thanks to the educational pressure from without, added to which is the sense of personal responsibility, the pharmacist is daily ceasing to be the mere vendor of his drugs; unconsciously, by recognizing the necessity of thoroughly understanding the nature and properties of remedial agents, he is working out the ethics of his trade. 'The maintenance of the public health' (I condense from Mr. Howden) 'requires the service of three separate offices. 1. The sanitary office, which enforces the observation of natural laws. 2. The physician's office, which investigates the nature of disease and studies the method of subduing it. 3. The pharmaceutical office, which consists in the skilful selection and preparation of remedies, and their direct application according to the physician's method. By virtue therefore of his own position, and his mutual relation with at least this second health officer, the pharmacist cannot worthily discharge his duty unless by deliberate cultivation he has made himself the fit companion and seconder of the physician.'

"It has been stated that the medical profession look with a jealous eye on the intellectual advance of the modern pharmacist. This is directly contrary to my own experience, and I believe it to be sheer nonsense. Why a professional man should tremble because his directions are likely to be understood and properly carried out, is beyond my feeble logic to explain. The one least likely to interfere with him in a professional career is the man who knows most of the varied action and the strength of drugs, and the therapeutic value of remedial agents. Such a pharmacist may be too nervous, but he will never be too rash, and the physician may rest in perfect confidence that the educated, intelligent dispenser will be the last to rush in where angels fear to tread.

"I cannot conceal the fact that in some communications which have reached me, the question of the mutual bearing, or rather of the boundary-line that marks off the medical man and the pharmacist, has not been fairly stated. Either under pressure of a felt grievance or from limited observation, strictures have been passed on the profession which are scarcely to be justified, and the matter has been argued too exclusively from our own point of view.

"Reasoning from the broad abstract theory, it is better for the surgeon to confine himself entirely to professional practice; but when we descend into ordinary life, there does not seem to be any valid reason why he should not be (if so he chooses) his own dispenser. This neither includes nor justifies the establishment on his part of an open retail, a

proceeding which exacts its own Nemesis. The man degrades the shop, and the shop degrades the man. What confidence can the patient feel in an adviser who has so little in himself?

"But that a surgeon should be debarred from compounding his own remedies is unfair to him and would often be unjust to others. The plan may have been dictated from motives of dispatch; in hundreds of outlying districts, from necessity; nor let it be forgotten that it may have been suggested also from the desire to have excellent and first-class preparations. Nor can I share the opinion that the private dispensary is a term synonymous with negligent dispensing and cheaply selected drugs. I am personally acquainted with some establishments which are models of what in pharmacy we might be content to imitate. The evil (if such it be) will in time work out its own remedy; for just in proportion as the recognized open pharmacy assumes a higher standing, and offers more professional facilities, will the private dispensary be felt by the proprietor to be a thing irksome and unnecessary, and, following the law of all progression, it will eventually disappear. But, on the other hand, there is a wretched practice which, wherever it exists, must stifle the ethics of the profession and the trade. I allude to those disreputable and most unprofitable compacts, where, under the guise of a percentage, or an accommodated tariff, or any other occult arrangement, the pharmacist dispenses for the surgeon, and is robbed of the profit of his labour.

"From my very heart I reprobate a system, the discovery of which is always a source of anxiety to the surgeon, from its unprofessional nature, and which, as far as the pharmacist is concerned, is the introduction of an unhealthy and underhand trade; miserably unremunerative, and too often a late-hour slavery, where there is not even self-respect with which to gild the fetters.

"There can be no true companionship where there is no esteem; deduct the element of mutual respect and honourable relationship between the medical profession, and pharmacy is at an end. But whose the fault? For should the pharmacist fail to be the helper and fit companion of the physician, he has not rightly understood either the dignity of his calling or its moral responsibility. At first, this dread feeling of responsibility hangs over him like the sword of Damocles, but with the fear comes also a sense of honour, the very inspiration of all that is high and excellent.

"The true pharmacist will always be the helper, for it is his to know the mechanism of the healing art, to develop new remedial agencies, to enter upon untried regions of experiment, to utilize the dreams of theory, and to bid science wait on the wants of daily life. In all these things the true physician will gladly be instructed, nor will he refuse advice nor withhold his friendship from one who, though working in an humbler sphere, is yet able to enlarge the basis as well as to guide the exercise of his professional skill.

"So between these two men grows up a thorough sensible understanding, founded on personal advantage, deepened by common sympathy, and cemented by mutual respect. Let us rejoice that this is the bare statement of every-day experience, and not mere elegant writing.

"Long may the profession and the trade work in perfect harmony together—their ethics are the same."

UNITED STATES ARMY MEDICAL SERVICE.

WE extract the following for the information of students from the memorandum of the United States Surgeon-General to persons desirous of entering the Army Medical Service:—

"The number of vacancies now existing in the Medical Corps of the U. S. Army is sixty, forty-six of which are original vacancies created by the Act of Congress approved July 28, 1866.

"All candidates for appointment in the Medical Corps must apply to the Surgeon-General U. S. Army, for an invitation to appear before the Medical Examining Board. The application must be in the handwriting of the candidate, stating age and birthplace, and be accompanied by testimonials from professors of the college in which he graduated, or from other physicians of good repute. If the candidate has been in the medical service of the army during the war, the fact should be stated, together with his former rank, and time and place of service, and testimonials as to qualifica-

tions and character from the officers with whom he has served should also be forwarded.

"Candidates must be graduates of some regular medical college, proof of which must be submitted to the Board before examination.

"The following will be the general plan of examination: 1. A short essay, either auto-biographical or upon some professional subject—to be indicated by the Board. 2. Physical examination. This will be rigid, and each candidate will be required to certify that '*he labours under no mental or physical infirmity, nor disability of any kind, which can in any way interfere with the most efficient discharge of his duties in any climate.*' 3. Examination as to general aptitude and education. 4. Written examination on anatomy, physiology, hygiene, surgery, and practice of medicine. 5. Oral examination on each of the above-mentioned subjects, and also on obstetrics, general pathology, chemistry, toxicology, medical jurisprudence, and materia medica. 6. Clinical examination, medical and surgical, at a hospital. 7. Performance of surgical operations on the cadaver.

"The aggregate amount receivable by an Assistant-Surgeon under three years' service is 120-82 dollars per month. The Examining Board assembled in New York on the 20th of September."

THE QUEEN'S UNIVERSITY IN IRELAND.

A QUEEN'S letter has arrived authorizing the assembling of the Convocation of Graduates of the Queen's University, in accordance with a memorial signed by a large number of graduates. The Convocation will then be constituted as a part of the system of the University. Its first business will be to elect a member of the Senate, to which body the Convocation is entitled to appoint six of the twenty-four members. The Convocation will then probably proceed to consider the proposed Supplemental Charter. A meeting of the Senate has been convened for the 6th of October, for the consideration of the same subject.

THE CHARGE AGAINST DR. JAMES PART.

AN inquiry before Dr. Lankester, the Coroner for Central Middlesex, has just been concluded in reference to the death of Mr. R. Golding, a well-known historical line engraver, who died on 28th of last December, and whose body has been exhumed under an order of the Secretary of State, in consequence of certain allegations made against his medical attendant. The following is the evidence:—

A letter not dated, but marked as received on the 20th of February, addressed to Dr. Part by the witness, complained of the treatment to which the deceased had been subjected at his hands. To that letter Dr. Part wrote a reply, in which he stated that the relation existing between Mr. Golding and herself did not confer upon her any right to assume the name of even "her departed friend." If she had been his friend, why did he tell her to go home, as he expected a nurse to attend him, for surely a friend would have been much more congenial to his feelings? She had said he had promised to get Mr. Golding a nurse. He did obtain one, after considerable trouble, who was to have come at noon upon the day on which Mr. Golding died. But the rooms were so disgracefully dirty that they were not fit to introduce a respectable nurse into. Had he been so constant a visitor as she had lately become he would have been ashamed to have suffered the poor old gentleman to have been so destitute of comforts and surrounded by so much filth and dirt as he had found him in, and he could not but remark that had she felt any real regard for him beyond the longing she had for his money she would have endeavoured to have kept him clean. Notwithstanding his imputed neglect of him, and the necessary delicacy it became him to use in interfering with him, before thirty-six hours had elapsed from his first seeing him, he had caused his bedroom to be made clean, warm, and comfortable for him, which she had never done. He had sent him down a bottle of sherry to warm his poor icy cold hands and feet. He had sent him down beef-tea as good as could be made. He had sent him down potted meat to save him masticating, which he was unable to do. He had brought him a warm new flannel waistcoat, which he would have put upon him had he allowed him. He had made him up a good fire, and given him warm sherry and water to assist the other means he had set in motion to restore and warm him, and had he been spared he would have had him made and kept warm and comfortable. She

had done none of these things, with all her affected regard for him. In conclusion, it stated that she had said that he had applied a bottle of hot water to Mr. Golding's feet, and then began ransacking, when he took two watches and a pocket-book containing money, the property of her and her mother. The cause of his ransacking was, that he was the executor, and that it was his duty and right to take possession and care of all his property, and also that he found that the drawer in which Mr. Golding had kept his money and securities had been tampered with, and that a sovereign that he had seen loose in the drawer with two bags of money which he had also seen there had been removed, and that the sovereign and one bag containing £2 in silver was secreted upon her person—that was, in her pocket—and upon his demanding them they were given up by her. That was his reason for ransacking, and he had a painful illustration of the cogency of that reason in the fact that he found a deficiency of upwards of £100 from what Mr. Golding informed him he would find in the house in gold, and from the peculiar accuracy of everything Mr. Golding had said to him he had every reason to believe that he was correct in that also. He had done and would do justice to everybody concerned, and feared not her threats, but if he detected her in slandering him he knew how to punish, and would not shrink from doing so.

By Mr. Winkworth, one of the jurors—Mr. Golding told her the day before his death, when she had been expending some of her own money, that she would find some money in the drawer which she was to take for expenses. She did not, however, take it then, but on the following day, when Dr. Part demanded it of her. She did not know the exact sum she took. She only took a bag which she gave to Dr. Part as soon as he asked for it.

Mr. Golding knew Dr. Part before. He had seen him at Mr. Taylor's some twenty years previously. Mrs. Part was present at his death. The deceased always wished to have a very respectable and genteel funeral, for he stated that they belonged to a respectable family (laughter). He told her that before he had seen Mr. Part. Mr. Golding left them in consequence of the lease of their house expiring, and did not again live with them, as they were unable to find a house sufficiently large for all of them to live in. He then removed to Stebbington-street, and he told her he wished to buy a house, in order that they might all live together. She was instructed by him to look out for an eight-roomed house, and had she succeeded in getting one she believed he had sufficient money to pay for it. He never said he should like to be buried in his trousers—what person would? (laughter). He never said he wished to be buried in his shirt or his stockings, but wished to be buried in a Christian-like manner.

Professor Rodgers of the London Hospital was then called, and he stated that he had made a further examination of the contents of the stomach of the deceased. Portions of the deceased man's stomach, spleen, and intestines with the liver and one lung had been removed. He made a special inspection of these parts. He had found a trace of morphia. He specially searched for strychnine and for other alkaloids, but had found nothing that was likely to bring on convulsions. In the stomach he was bound to state that he had found a trace of arsenic. In the intestines he had not found a sufficient quantity to be able to state that it was arsenic. He had used every precaution to insure the most perfect results. In the liver there was no trace of arsenic. Finding that absent, he came to the conclusion that no quantity of arsenic had been swallowed sufficient to destroy life, for had that been the case he must have found it in the liver. He found no other poison, and there was nothing that could lead him to believe that he died of anything else than bronchitis. Convulsions sometimes preceded death from bronchitis. He believed and was of opinion that the arsenic must have been mixed up in the medicine through error. It was certainly not any arsenic produced after death. He had never found arsenic naturally, but had there been a dose sufficient to produce injury he must have found it in the liver, and it was probable that there would have been vomiting and purging. There was not sufficient arsenic to accelerate the death of a man of his age. Very little morphia must have been taken, much less than the arsenic, for there was only a trace. If an opiate had been given deceased would have continued drowsy to the end, and would not have been awake as he was when he died. Strychnine could be detected in less quantities than any other poison,

and for a longer period than any other vegetable poison. One hundred thousandth part of strychnine could be easily detected. There was certain poisons which would evaporate after death. He was quite certain his tests were pure. The arsenic might have been produced by making the cocoa which the deceased had in a metallic pot.

Dr. Part said he was called to see the deceased on the 26th of December last. He was told that Mr. Golding was very ill and wished to see him as soon as he could go; also that he wanted to see him on some private business. He went between two and three o'clock in the afternoon. Deceased was alone when he saw him, and said to him "I have sent for you to be my executor, for I am very ill, and feel that I have not long to live. I got my clothes wet, and since that I have been extremely ill. I have a very bad cough, and my breathing is very troublesome. I have become so much weaker the last two or three days that now I cannot get up and down stairs." Deceased was then in the front room which was very dirty. He shook hands with deceased when he went in, and found them very cold and clammy. He thought his case hopeless. Dr. Part then read from his day book the prescription which he entered for Mr. Golding. One draught of the mixture contained one-twelfth of a grain of opium. Mr. Edward Robertson made up the prescription. He had since left witness. He had known Mr. Golding twenty years previously. After he had been in a short time deceased said that he wanted to make his will, to which witness replied that he had better get a solicitor. Deceased said he felt too ill, and requested witness to follow his instructions, which he did, and put them down upon a piece of paper. It was as follows:—"I give and bequeath to Frances Southgate £100, and to Frances Julia Southgate £100. I give you (witness) all my folios, proofs, and prints, and leave you my residuary legatee and appoint you my sole executor. You will find in the house £200 or thereabouts in gold and silver, £90 in notes, and standing in my name in the Three per Cent. Consols you will find £1200." He (witness) asked him if he had any relations, to which deceased replied that he had some, but had not seen them for many years. They behaved very bad to him, and he did not care for them. He had sometimes thought of leaving his money to a friend, an artist, but there were circumstances which induced him to believe it would be squandered away, and therefore he had decided upon giving it to him. Witness asked him if he had any other wishes, when deceased told him he should like him to give his landlady £10, or his furniture, just which he pleased. He asked him if he would like the legacies to Mrs. and Miss Southgate free of legacy duty, to which deceased replied, "Well, no, I have been thinking over the matter, and, if you do that, your legacy will not reach £1000, which I am very anxious it should." Witness told him to describe him in the will as of 45, Upper Seymour-street, as he lived there when he bought the Consols. Witness sent deceased, besides his medicine, some wine and turkey. Upon leaving him he gave £50, stating that he might as well have some money to pay expenses.

After leaving, Mr. Golding went to find a nurse. Afterwards he went for a solicitor. When it was completed Mr. Golding raised himself up and said, "Now, Mr. Part, I give this into your charge, and take care of it." He emphasized the words "Take care of it," but he could never understand why he did so. On that day he gave Mr. Golding a little hot sherry and water; and he seemed better when he left him. He did not visit him in the evening because he was unwell himself. He had no recollection of telling Miss Southgate that on the death of her mother the whole of the property would go to her, neither did he show her any paper. He went to Mr. Golding on the morning of his death, and found him very bad. He was convulsed, and although he could not speak, still he was conscious. The Southgates were in the room at the time. He remained with him until half-past twelve o'clock, when he left in order to attend to other patients. During his visit that morning he observed Miss Southgate went into the sitting-room several times. After her second visit he went into the room and perceived that the drawer in which Mr. Golding kept his money was open. He saw two bags of money and a sovereign loose in it. He did not touch it, but before leaving the house he again went into the room, and finding the drawer was shut he opened it and found that a bag of money was gone. He called Miss Southgate, and told her there was some money missing, to which she replied that she had got it, and then gave it up to

him. When he returned in the evening he requested Miss Southgate to remain in the house until they had searched the place, saying that she had aroused some very disagreeable impressions in his mind, and he could not allow her to go until they had found all the money. That night they found £60. On the following morning in a box they found an old fashioned leaden inkstand, and between the side of the stand and the metal inkpot they found a roll of sovereigns to the number of about sixty, making altogether about £90. Before Mr. Golding died he asked him if he had any request to make about the disposal of his body. Mr. Golding said "No," they might take it to the dissecting-room if they liked, to which witness replied that he could not. He could not in any way account for the presence of arsenic. He wrote Mr. Golding's prescription and entered it, and left it to his assistant to make it up.

The complaint Mr. Golding was suffering from was bronchitis. He knew Mr. Cameron, a solicitor. He was not his solicitor. Miss Southgate had never told him that Mr. Golding was a friend of hers. He never said the deceased was a poor man. He knew Mr. Taylor, of Agar-town. He was drowned by falling off the pier at Southend. He discharged Mr. Taylor's debts in return for a collection of very fine prints which Mr. Taylor had.

Edward Robertson, then called, stated that he was an assistant to Dr. Part in December last, and remembered making up Mr. Golding's medicine strictly from the prescription. He did not make the pills, for they were kept up in stock. Since he had left Dr. Part he had not seen the prescription-book.

Captain Edward Wolf Brooker, R.N., was next called and examined.—He stated that he was a son-in-law of Dr. Part. He was on a visit at Dr. Part's house in December last, and went with the Doctor to the house of Mr. Golding, where he was told he was wanted to attest a will. He was one of the witnesses. Dr. Part after he had introduced him left the room to get some ink, and then the will was read to the deceased, who remarked that it was exactly what he wanted. The deceased was perfectly sensible when the will was read. He knew nothing about the residuary property left to Dr. Part. He went to Mr. Golding's house on the following day, because he knew that Mrs. Part was there alone. Miss Southgate was not in the room when the will was read.

The jury returned the following verdict:—"That on the 28th of December, 1865, Mr. Richard Golding was found dying, and did die, at his residence in Stebbington-street, in the parish of St. Pancras; and the jurors are of opinion that the said death occurred from bronchitis; and although a small quantity of morphia and arsenic was found in the stomach of the deceased, death was the result of natural causes."

THE QUEEN'S UNIVERSITY IN IRELAND, DUBLIN CASTLE.

Examination for Honours—M.D. or M.Ch.

September 25, 1866.—Morning.

MEDICINE.

Examiner—ROBERT D. LYONS, F. & C. K.Q.C.P.I.

1. State some of the proofs relied on to show that increased tissue-waste attends true pyrexia, and is the exponent of its chief active conditions.
2. Describe the pathology and pathological anatomy of cholera-typhoid.
3. Define the pathology, diagnosis, and treatment of a case of cerebro-spinal arachnitis.
4. In arachnitis of the basis cerebri principally, dilatation of the pupil has been frequently noticed as an important sign; explain its occurrence and pathological significance.
5. Define the practical rules which should guide the practitioner in regard to the operation of tracheotomy in croup.
6. Describe the "tâches bleuâtres," and their more ordinary pathological indications.
7. Describe the pathology, symptoms, and treatment of phlegmasia of the lower extremity after fever.
8. In a case presenting loss of motor power at one side throughout, with persistent normal sensation, define the locus of the centric lesion, and state your treatment and progression.
9. Define the principal varieties of Enteritis, and state the treatment appropriate to each.

10. In a case of Nephritis, define the special symptoms which would place the disease out of the range of curable affections.

11. With what affections is Eczema impetiginodes liable to be confounded? state your diagnosis and treatment.

12. What are the symptoms and signs which attend the passing of gall stones? and state your diagnosis and treatment of such a case.

MIDWIFERY.

Examiner—LONBE ATTHILL, M.D.

1. What are the causes which favour prolapse of the Funis Umbilicalis, and how would you treat that complication of labour?

2. What symptoms would induce you to fear that an attack of convulsions was impending in a pregnant woman, and by what means would you endeavour to avert the attack?

3. Enumerate the circumstances under which it would, in your opinion, be justifiable to induce premature labour, and name the means you would make use of for the purpose.

4. What do you understand by the disease known as "phlegmasia dolens;" describe its symptoms, and give the treatment you would adopt for its relief?

5. What would be your diagnosis in the following case?—A few days subsequent to delivery, a woman is seized with sudden faintness, followed by irregularity of the heart's action, dyspnoea, collapse, death rapidly supervening.

MATERIA MEDICA AND PHARMACY.

Examiner—Dr. W. D. MOORE.

1. Give the formula for preparing atropia according to the British Pharmacopœia. State the rationale of the process.

2. What is the solubility of atropia in chloroform?

3. In what doses might atropia be given internally, and what are its pharmacopœial preparations?

4. Write an unabbreviated prescription, in Latin, for a full dose of opium to be taken in the form of draught, at night, by an adult.

5. What preparations of hyoscyamus occur in the British Pharmacopœia? Mention the natural family and describe the botanical characters of the plant.

6. How is the oxide of silver prepared? State its therapeutical uses and doses.

7. Write an unabbreviated prescription, in Latin, with directions, for aperient pills for occasional use by an adult.

8. How is the hydrated peroxide of iron prepared? Explain the process, and state the mode in which the product is said to act as an antidote to arsenic.

9. To what natural family do the mints belong?

10. Give the formula for, and state the doses of, the pilula plumbi cum opio.

MEDICAL JURISPRUDENCE.

Examiner—Dr. W. D. MOORE.

1. What are the symptoms of poisoning by the inhalation of carbonic acid?

2. How would you detect the presence of carbonic acid in atmospheric air? Describe a simple method of determining the proportion of the former in a given measure of the latter.

3. Describe the ordinary tests for strychnia.

4. In a case of suspected poisoning with strychnia, where the colour-tests fail to discover the presence of the latter, what other alkaloid should be sought for, and in what way?

5. What is the medico-legal definition of a wound?

6. What are the direct causes of death in cases of wounds? Enumerate also some of the indirect causes of the same.

7. What are the various causes of syncope, and in what condition is the heart found, when death takes place by that organ?

8. What is the usual condition of the great vessels in cases of death by the lungs? Is this state invariably present?

9. What are the most striking differences between the symptoms of perforation of the stomach from disease, and those produced by irritant poisoning?

10. What circumstances may be relied upon as presenting conclusive evidence of death?

The committee of the Royal Kent Dispensary, Greenwich, have awarded the sum of £50 to the resident surgeon, H. Wm. South Sturton, Esq., and the dispenser, Mr. Thos. Sturton, in acknowledgment of their additional labours during the cholera epidemic.

Medical News.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on Sept. 20th:—

Green, Frederick King, Stoke, Newington.
Smith, Robert Harman, St. Andrew's-road, S.E.

The following gentlemen also on the same day passed their first examination:—

John Orton, Syd. Coll., Birmingham; Edward De Morgan, Univ. Col.

PRIZES IN MATERIA MEDICA AND PHARMACEUTICAL CHEMISTRY.—The Society of Apothecaries of London annually offer two prizes for proficiency in the knowledge of the *Materia Medica* and Pharmaceutical Chemistry, and the examinations of the present year will be held at the hall of the Society on Wednesday, the 17th, and Friday, the 19th inst. Candidates for the prizes, which consist of a gold medal for the first prize, and of a silver medal and a book or books for the second, must intimate their intention on or before the 7th inst. The candidates must be students who have entered upon the third winter session of their medical studies.

The Court of Aldermen have just voted £1000 to the new lunatic asylum lately erected at Dartford.

HARVEST-HOME collections from a great many districts have been forwarded to the cholera funds of London.

The Library and Museum of the Royal College of Surgeons, which have been closed for a month, reopened on Monday last.

DR. NORTON SHAW, the late Secretary to the Royal Geographical Society, has been appointed Her Majesty's Consul at Sainte-Croix.

The cholera is making frightful strides in Vienna. One of the most distinguished operators, Freiherr von Wattmann, has fallen a victim to the disease.

It is stated that out of 20,000 infants who are annually sent out of Paris *en nourrice*, not more than 5000 survive: 15,000 die of cold, hunger, and neglect.

M. MARIA, late a surgeon in the French navy, died lately at Nice. He is supposed to have been the last of the French officers who took part in the Battle of Trafalgar.

SIR CHARLES HASTINGS' library has been offered, by his family, to the professional men in the city and county of Worcester, to be kept at some public place in the city for facility of reference.

It has been proposed to hold an exhibition of works of art and industry in the Leeds New General Infirmary, and a meeting of the inhabitants has been convened by the mayor to consider the subject.

It was observed that in this last visit of the cholera to Paris, the new boulevards and their vicinity were among the healthiest places. Besides the wider thoroughfares and greater flow of air, the drainage is said to be better.

A GIRL twelve years of age died on Wednesday week at Clapton from swallowing a damson stone. It was found, on a post-mortem examination, that the sharp point of the stone had passed into the lungs and produced rapid inflammation, which caused death.

A MAN named Martin Rean is now awaiting his trial at Deux Sevres, France, charged with having poisoned his brother-in-law in 1853, in 1856 his first wife, in 1865 his second wife, and in 1866 his daughter. Cupidity is said to have been the motive for such wholesale murder.

The death-rate returned from Liverpool for the week ending Sept. 22nd was fifty-two per 1000, or more than double that of either London, Sheffield, Leeds, Hull, or Glasgow; nearly 100 per cent. in excess of the death-rate of Dublin, Manchester, and Salford; 50 per cent. in excess of Newcastle-upon-Tyne; and nearly treble the death-rate of Birmingham, Bristol, and Edinburgh.

PREPARATIONS FOR CHOLERA.—A French Prefect wrote to one of the mayors of his department advising him,

as the cholera had broken out in the district, to take all the necessary precautions. After some time the mayor wrote to say that he had taken all the proper steps, and upon the perfect sending to see that they were effectual, he found that the only preparation the mayor made consisted in having a large number of graves dug in the churchyard.

CHOLERA having broken out at Alexandria, it has been decided that all ships from thence shall be subjected to thirty days' quarantine at Malta.

THE SOCIAL SCIENCE ASSOCIATION.—The Earl of Shaftesbury, the President, has consented to take the chair at the dinner, on October 9th. All the arrangements for the meeting are progressing satisfactorily, except one. The single exception is, that not enough funds for the expenses have yet been provided. The total sum required is only £2500, of which £1700 has been subscribed.—*Manchester Guardian*.

SANITARY IMPROVEMENTS IN THE PUBLIC SCHOOLS OF FRANCE.—The Minister of Public Instruction has just issued a circular to the directors of the lycées (government schools) of the empire, wherein he states that such pupils as are left by their parents in these establishments during the holidays (part of August, September, and part of October) should be sent to schools situated near the coast, where sea-bathing and sea-air might be beneficial to them. The directors are also directed to watch over the health of the pupils, and when, under medical advice, a change to warm latitudes is found desirable, to send such boys to schools of the South of France. Also to institute travelling parties in the holidays where circumstances will allow.

COMFORT FOR RATEPAYERS.—Mr. Arnold, Government Inspector of Public Works in Lancashire, says that if Londoners obtained the soft water of Wales or the lakes, in the place of the hard water which is now supplied to them, they would require but one half the quantity of soap and one third quantity of tea and coffee which they now use, and he reckons the saving upon these three articles alone at £675,000 a year, which capitalised at 4 per cent., would amount to nearly £17,000,000, or enough to pay for the waterworks twice over.

FEMALE DOCTORS.—A young lady in Paris, having honourably passed two examinations in mixed sciences, has been authorised by the Minister of Public Instruction to go through a preparatory course of medicine at Algiers, as her medical attendance might be of great service to the Arab population, and through her the boon of medical science might penetrate the tent and harem of the Arab, where no male doctor would ever be admitted. Lately another lady has passed her examination as midwife, and has obtained permission to offer herself as a candidate for examination at Paris for the degree of Doctor of Medicine.

A NEW DANGER TO PUBLIC HEALTH.—The refuse drainage matter from paraffin oil works finds its way into the adjacent streams and rivers, the water of which becomes offensive from the odour and taste of oil, or poisonous from the still more deleterious waste products that occur in the manufacture; it is consequently quite unfitted for domestic purposes, and the fish have been already destroyed in several streams. Hitherto the manufacture of paraffin has been confined to particular districts, but now we are threatened with an extension of paraffin works all over the kingdom. It has recently been discovered that a ton of ordinary coal, which yields about 18,000 cubic feet of gas when distilled in the usual manner at a red heat will, if distilled at a lower temperature, furnish one-third of that amount of gas and 60 gallons of crude paraffin oil. It is, therefore, more profitable for gas manufacturers to make the two products than to produce gas only, as the oil and the smaller quantity of gas are more valuable than the larger amount of the gas without the oil. Already this system has been introduced in Scotland, and soon it may be generally adopted; in which case ordinary gasworks will become paraffin distilleries, with all their concomitant evils. As regards the prevention of these injurious results, there can be no insuperable difficulties in getting rid of the spent acid and alkaline liquors. It will be more troublesome to prevent the leakage of the oil into the soil, whence it is sure, sooner or later, to be washed into the adjacent streams, being absolutely indestructible by moisture or atmospheric agency.—*The Field*.

Notices to Correspondents.

A. W.—The person named is a qualified member of the profession, although not, we believe, a Member of the College of Surgeons of England.

The *Obstetrical Society of London*.—The notice is inserted.

Dr. L.'s letter has been received.

Mr. E.'s request shall be attended to.

To Dr. Lane, R.N.—Owing to great pressure on our columns, we are compelled to postpone your communication till next week.

Dr. F. W.—r.—Many thanks for your paper. We regret it arrived too late for this week's issue. Proofs shall be sent you.

Dr. Oppert shall have a private note.

Communications received from:—Dr. Crisp, London; Dr. Oppert, London; Dr. O. R. Frankerd, Langport; Dr. Brown, Dorchester; Pharmaceutical Society, Obstetrical Society.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—On reading the Students' Number of THE MEDICAL PRESS AND CIRCULAR, I observe two or three mistakes in regard to the Preliminary Examination in Arts in the Edinburgh University (page 291), and which you will readily perceive on referring to a Calendar of the present year. I notice that in Greek the first book of Xenophon's *Anabasis* is required instead of the *Cyropædia*; in French, also, Fontaine's *Fables*; and logic, Whately's *Elements*, Books I and II. With these observations, I remain, Sir, your obedient servant,
Langport, Somerset, Sept. 21, 1866. O. R. FRANKERD.

[Owing to the great demand upon our space this week—although eight pages larger than usual—we are compelled to postpone the remainder of the "Introductory Lectures" and the principal Medical Schools, as well as several Original Communications, Correspondence, Reviews, Hospital Reports, &c. &c.]

Appointments.

LONDON.

- S. CHATER, M.R.S.C.E., has been appointed Chloroformist to the Great Northern Hospital.
G. N. EDWARDS, M.D., has been appointed a Medical Officer to the Linen and Woollen Drapers' &c. Institution.
H. POWER, M.B., has been appointed a Medical Officer to the Linen and Woollen Drapers' &c. Institution.
A. E. SANSON, M.B., has been appointed one of the Medical Officers to the Linen and Woollen Drapers' Institution.
FULLER, W., M.R.C.S.E., has been appointed Visiting Apothecary to St. George's Hospital.
GREGGON, G., M.R.C.S.E., L.D.S., has been appointed Dental Surgeon to the Metropolitan Free Hospital, Devonshire-square.
GRIFFITHS, R. S. P., L.R.C.P.L., M.R.C.S.E., has been appointed Apothecary to St. Mary's Hospital.

PROVINCIAL.

- D. H. B. ANDERSON, M.B., M.R.C.S., &c., has been appointed House-Physician to the Hereford General Infirmary, vice H. G. Walker, L.R.C.P., M.R.C.S., resigned.
H. T. BROUGHTON, M.R.C.S.E., has been appointed Resident Medical Officer to the Infirmary and Dispensary, Bradford, Yorkshire, vice Thomas, resigned.
N. G. MERCER, M.D., has been appointed a Junior Medical Officer of the Lancaster County Lunatic Asylum, Lancaster, vice J. D. Moore, M.D., resigned.
O. EVANS, M.R.C.S.E., has been appointed House-Surgeon to the Royal Berkshire Hospital, Reading, vice J. Swindale, M.R.C.S.E., resigned.
H. SIMPSON, M.D., has been appointed Physician to the Manchester Royal Infirmary.
F. V. SANDFORD, M.R.C.S.E., late of the Royal Navy, has been appointed Resident Medical Officer to the Hospital Ship *Hamadryad*, Cardiff.
ANDERSON, C. L., L.R.C.P. Edin., I.S.A., &c., has been appointed Assistant House-Surgeon to the Liverpool Northern Dispensary.
ANDERSON, D. H. B., M.B., M.R.C.S., &c., has been appointed House-Surgeon to the General Infirmary, Hereford.
WYLLIE, J., M.D., has been appointed Resident Physician to the General Hospital, Birmingham.

IRELAND.

- SALMON, T., L.R.C.P. Ed., has been elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Castlepollard Dispensary District of the Delvin Union, Co. Westmeath, vice D. H. MacAdam, M.D.
MOURITZ, J. W., L.R.C.P. Ed., has been re-elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Crossroads Dispensary District of the Dunfanaghy Union, Co. Donegal.
FILSON, A., M.D., has been elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Portaferry Dispensary District of the Downpatrick Union, A. B. Filson, M.D., resigned.

POOR-LAW MEDICAL VACANCIES.

- Lancaster Union*.—Tanfield District; area 10,297; population 7562; salary £30 per annum.
Westbury and Whorwellsdown Union.—First Division of the Second District; area 12,616; population 8623; salary £80 per annum.
Whitchurch (Salop) Union.—Area 15,847; population 8621; salary £42 per annum.

Medical Diary of the Week.

OPERATION DAYS AT THE LONDON HOSPITALS.

- WEDNESDAY.—Royal London Ophthalmic Hospital, Moorfields, 10½ a.m.; Middlesex, 1 p.m.; St. Mary's, 1½ p.m.; St. Bartholomew's, 1½ p.m.; St. Thomas's, 1½ p.m.; Great Northern, 2 p.m.; University College Hospital, 2 p.m.; London, 2 p.m.
OBSTETRICAL SOCIETY OF LONDON.—7 p.m. Meeting of Council.—8 p.m. Dr. W. S. Playfair, "On the Mechanism and Management of Delivery in Cases of Double Monstrosity."—Dr. C. H. Routh, "On a New Mode of Treating Epithelial Cancer of the Cervix Uteri and its Cavity."
THURSDAY.—Royal London Ophthalmic, 10½ a.m.; Central London Ophthalmic, 1 p.m.; St. George's, 1 p.m.; Surgical Home, 2 p.m.; West London Hospital, 2 p.m.; Royal London Orthopædic Hospital, 2 p.m.
FRIDAY.—Boyal London Ophthalmic, 10½ a.m.; Westminster Ophthalmic, 1 p.m.
SATURDAY.—St. Thomas's, 9½ a.m.; Royal London Ophthalmic, 10½ a.m.; St. Bartholomew's, 1½ p.m.; King's College, 1½ p.m.; Royal Free Hospital, 1½ p.m.; Charing-cross, 2 p.m.

BOOKS RECEIVED.

- Rev. H. H. Higgins on Vitality.
Dr. A. C. Macleod on Acoholic Diseases. London: Churchill and Sons.
A Practical Treatise on Apoplexy. By Dr. W. B. Mueset. London: Churchill and Sons.
Dr. Edwards Crisp on Malignant Cholera.
Harley on Diabetes.
Complete Set of Coloured Lithographs on Diseases of the Skin. By Balmano Squire, M.B. London: John Churchill and Sons.
On Cholera. By Arthur E. Sansom, M.B. London: John Churchill and Sons.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

PROVINCIAL.

- HOLT.—On the 22nd inst., at Carlton Villa, Castleford, Yorkshire, the wife of James Holt, L.R.C.P. Ed., of a daughter.
ROBINSON.—On the 23rd inst., at New-square, Chesterfield, the wife of Dr. H. Robinson, of a son.
SOMERVILLE.—On the 24th inst., at Milford, Pembrokeshire, the wife of David Hope Somerville, M.D., of a daughter.
EVANS.—On the 25th inst., at Brynfydwyn, Treherbert, the wife of W. Evans, L.R.C.P., of a son.
JOLLYE.—On the 13th inst., at Donington, Spalding, the wife of E. W. Jollye, M.R.C.S., of a son.
FRANGLEY.—On the 15th inst., at Aldborough, the wife of Thomas Frangley, M.R.C.S., of a son.
McGEORGE.—On the 15th inst., at Norton-street, Liverpool, the wife of S. J. McGeorge, L.R.C.S. Ed., of a son.

MARRIAGES.

- GWYNNE—MARSHALL.—On the 19th inst., at Rostall Church, Tunbridge Wells, Edmund Gwynne, M.D., of Upper Holloway, to Adelaide Eliza, third daughter of the late John Marshall, Esq., of Eden-lodge Beckenham.
LEVICK—CURTIS.—On the 20th inst., at St. Mary's, Plaistow, Essex, G. Levick, M.R.C.S.E., to Martha Sarah, eldest daughter of the late R. L. Curtis, Esq.
SPRATLEY—BOYDELL.—On the 20th inst., at St. Bride's, Chester, S. Spratly, M.D., of Rock Ferry, Cheshire, to Anna Maria Elizabeth, eldest daughter of the late James Boydeell, Esq., of Hawarden, Flint.
WILLIAMS—HELM.—At St. James's Church, Bury St. Edmund's, John Williams, M.D., to Caroline Anne, youngest daughter of the late Rev. J. C. Helm, of Worthing.

DEATHS.

- CRIBB, H., M.R.C.S.E., at Bishop's Stortford, on September 20, aged 67.
ROBINSON, R. E. W., M.D., at Swinton-park, near Manchester, on the 21st inst., in his 90th year.
FORGE, F. P., M.R.C.S.E., on the 15th inst., of Hemingborough, Yorkshire, aged 45.
WARRY, E. T., M.D., on the 16th inst., of Sidmouth, Devon, aged 64.
FETCH, E., Surgeon, on the 16th inst., of Alma-square, Scarborough, aged 65.
MORLEY, T., L.R.C.P. Ed., on the 20th inst., of Oldham.
ANDERSON, Dr. T. A., on the 19th inst., at Springtown Cottages, Londonderry.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX"

OPENING OF THE ENGLISH MEDICAL SCHOOLS.

INTRODUCTORY LECTURE,

DELIVERED AT

ST. GEORGE'S HOSPITAL.

By Dr. J. W. OGLE.

GENTLEMEN,—The authorities in this School of Medicine are not among those who consider that the custom of meeting together formally to mark the beginning of the "medical year" is "more honoured in the breach than the observance." I, therefore, acquiescing in this view, most willingly acceded to the invitation of my colleagues to deliver this Introductory Lecture, for I remember with pleasure the interest which I have taken in lectures of the kind delivered by others, and I have a keen sympathy with such feelings and thoughts as of necessity must possess the minds of those to whom such lectures as the present are especially addressed. I must, however, confess to some embarrassment when determining the form in which my observations should be moulded and the direction which they should observe.

The nature and scope of our time-honoured Introductory Lecture are so unfixed, so absolutely left as a matter of private judgment to him who is charged with its delivery, that I suppose two persons could hardly be found who would precisely coincide as to their ideal of what such a production ought to be. Indeed, when I actually addressed myself to the subject, I could not help being reminded by our annual observance of the statement which I have somewhere seen, that every year the Romans were at one time accustomed to offer in sacrifice one human being to one of their divinities.

On mature reflection, it appeared to me that the introductory lecture was not the opportunity, as some have accounted it, for a dissertation upon any abstract philosophical or transcendental theme, nor the fit occasion for a tirade, which to so many would be mere platitudes, on many questions connected with the medical education and discipline, the reform and organization of the profession, &c. On the whole, I determined, soliciting your indulgence, that I should act most serviceably if I strove to render those remarks which I shall have the honour to make, as plain-spoken and as practically subservient as possible to the personal requirements of the majority of those present, bearing in mind the immediate objects which, in this place of education, we have always in view, not, however, forgetting the adage—"Difficile est proprie communia dicere." In so doing, I believe I shall also follow the example which, in this hospital, has for the most part been set by my predecessors in this office.

Analyzing, perhaps rather roughly, the components of an audience so complex and so discriminative as this which I see before me, may I not divide it for present purposes into separate categories, for each of which the introductory will appear to possess a distinct and separate significance, and to serve a different purpose.

1st. Are the more veteran among us the Nestors or Corypheæ? if the term be allowed, occupying mainly the foremost benches, to whom experience and ability with length of days have secured the respect and arbitration of our profession, the only tribunal whose judgment is decisive, and the suffrages and gratitude of the public, of

whom it may be truly said, "aliis inserviando consumuntur, aliis medendo meriuntur." Turning in here for an hour from the bustle and tide of daily life, they will no doubt render this an opportunity of friendly greeting with former colleagues or companions brought together, and of wishing anew success to their Alma Mater, calling back to mind old times, and for a moment, and that with benefit, living in the associations and reminiscences of the irrevocable past. "Hoc est bis vivere, vita posse priori frui." Can they forget their former impressions and requirements as students in this place and resist the impulse, by friendly eye and hand, to welcome as future compeers those who seek to tread in their steps and to emulate their example, hereby rendering this lecture the means of *introduction* in the best sense of the word, and establishing a continuity between themselves and those destined to hand down the torch from their hands, and to extend the empire of truth. It is becoming here to mention with regretful remembrance the withdrawal from among us of two of the oldest friends of the hospital—I allude to the late Dr. Seymour and Mr. Fuller. Both had for long periods been officially connected with the institution; the former as Physician for nearly twenty years, the latter as Visiting Apothecary for nearly fifty years. Dr. Seymour's practical sense, sagacity, and ability, are well attested by his published works on Insanity, Gout, Dropsy, Ovarian, and many other diseases. His kindness and attention as a teacher are gratefully remembered by many present; and to Mr. Fuller's interest and unvarying activity in its concerns we owe, I may say, the very existence of this hospital as it now stands.

2ndly. Among my audience are those who, having fulfilled their course of required study, and being freed from the necessary restrictions of the pupil life, are starting for the course which is before them in the world.

Then come those who not having yet attained to the position of the latter are nevertheless anxiously expecting it, and looking for the rewards of their exertions, being as yet immersed in the numerous and important studies of their curricula.

And lastly, but by no means least in importance, are those who having determined as to their choice of a profession, but now come forward and enlist in those ranks to which we are all so proud of belonging. To you who constitute the last of those divisions of my audience, who from this day will cease to be strangers to this theatre, and to whom henceforth every stone as it were of this hospital must (if you do your duty) become most familiar, I will first address myself as having the privilege of offering to you the earliest point of contact with the medical profession. The entrance on the preparation for the calling of our life must be to all a most important period, and I cannot but think that in future it will be to you a matter of interest that you commenced your studies in a year which will be looked upon by posterity as forming an eventful epoch, whether on the one hand the scientific and practical interests of England and of Europe generally be considered, or on the other hand their political conditions and their social and religious attitude.

I must congratulate you on your selection of a hospital. In addition to the many advantages which are here to be obtained, allow me to say that I believe the facilities for prosecuting study and for observation which are open here to all students, are unequalled in any other metropolitan hospital. I allude especially to the almost unrestricted access to the patients at all hours. For this we have to thank the wise permission of the Board of Governors of the Hospital who know how much it is to the well-being of their charitable institution that highly trained and efficient medical men should grow up within its walls. We are awaiting the completion of structural and other arrangements which will enhance still farther the value of such advantages as are offered to you; and here I would comment on the benefit which it is to you to have to spend your student life in such a part of the metropolis as this—in close proximity and with free entrance to those culti-

vated and health-giving parks (botanical gardens I might say) which surround us—in sight and well-nigh under the shadow of that glorious old Abbey Church and of our Royal Palaces and Houses of Parliament, ever reminding us amidst our modern scientific and utilitarian pursuits of our national and social history, of our ancient and hereditary rights, and of all that is ennobling and sacred in our eyes. Will you not also live daily under the very eye and outstretched arm of him whose example for moral firmness, precision, energy, and at the same time simplicity of character and powers of rapid execution, should be a constant lesson to every Englishman. All this will be your privilege instead of having to lodge, as students of medicine must do, in many parts of our metropolis, in narrow crowded streets, it may be in close tenements some stories high for the advantage of air and light.

Of course your present object in attaching yourself to this place is the pursuit of the study of medicine—to learn, that is, how to repair, to palliate, and to prevent such ills or diseases as men are heirs to; to alleviate pain (blessed power) too frequently unvalued, and to help their bodies to obviate the injurious effects of the many external influences to which they may be exposed. Your ultimate object will be the practice of medicine and surgery.

Now the first thing to be done in all cases by way of insuring the successful undertaking of any object or occupation in life is to obtain as exact a knowledge and understanding as it is possible of its character, limits, and possibilities, and of the best mode of compassing it; to scan it well and long from all points of view. And to help you in this way with regard to your future work my present efforts will be directed.

At the beginning of your career the question for you to ask and to be informed upon is as follows—viz., what is disease, which it will be your business to learn, to treat, to combat, and to subdue?

At present it will perhaps appear to many of you a very elementary and even puerile—in fact, unmeaning—question, just as if (you will say) everybody did not know that disease was dis-ease, or, as the French say, mal-aise or maladie. But this definition is the popular and not the scientific one, and you will henceforth have to divest yourselves of popular and, as much as possible, assume what are termed scientific thoughts. The definition of disease to satisfy us whose duty it is to investigate its nature and phenomena—that is to say, the definition upon the right understanding of which our views of treatment ought to depend, is one which we are only now beginning to learn, or at least to appreciate. The idea of disease in the abstract, whatever the sequence of causation in its production may be, is fundamentally altered Function of Health (whether the alteration be by excess, diminution, or perversion).

Hunter once said that deviation was, under certain circumstances, part of the law of nature." Again, that disease was "a want of combination of actions, or a disposition to wrong action." In other words, pathology is merely altered physiology, just as morbid growths in structures, animal or vegetable, or morbid conditions of organs, or of minute parts, are only altered natural organs or parts, and death itself has been termed "a fresh form of life." This view of disease is the appropriate conception which must influence us in all our medical studies.

It would be foreign to my present object to enter into any consideration of the various agencies by which such disturbance of function is induced; but it is on the clear realisation of the above-named truth that the correctness of our thoughts as to the treatment of disease must depend. An excellent and easily recognised example of the fact that disease is altered natural function, may be found in the usually intractable disease, saccharine diabetes, the earlier periods and slighter forms of which appear to be merely exaggerations of conditions which are natural to the body, or, as we technically say, "normal" (using rather an awkward phrase), and may be artificially induced. Urinary and biliary calculi are also good instances of dis-

ease resulting from an excess of such constituents as naturally exist in the urine and bile. Again, the troop of diseases which depend upon the precipitation of fibrin in the bloodvessels and in various organs of the body are but the results of overcharging of the blood with that fibrin which is natural to it, or of a condition of that fluid arising from some determining cause or other, owing to which the fibrin, not excessive in quantity, ceases properly to be held in solution. Just so, likewise, many states which are termed inflammatory or congestive are but examples of exalted nutritive processes which in themselves are natural. Diseases are not definite and distinct, ponderable or imponderable entities to be antagonised by a positive "methodus medendi" which opposes to them an invariable and reliable antidote.

I allude thus far to the definition of disease, as it is a matter which lies at the very threshold of all our practical inquiries, and will reach you, so to say, at every turn, and because it is one which, I conceive, will be, by the novice at any rate, almost certainly misunderstood.

Intimately connected with this consideration is of course the abstruse question of the origin and nature of that upon which health (the opposite of disease) depends—viz., the principle of life.

Happily we have not in these our studies, either as physical or metaphysical inquirers, to agitate ourselves on such matters, diving, as it were, into the arcana of eternity; but there is an allied question which still vexes not only philosophical thinkers and historians of opinion, but also observers of the present moment, to which, though it will probably be never settled to the satisfaction of all, I will briefly allude. It is one which has lately, and will also for the future, occupy the attention of medical men and of physical inquirers; as its interest is much enhanced by the advance which has lately been made in our knowledge of the various so-called physical forces, and especially of their conservancy and correlation. The inquiry is, whether there be such a thing as Vital Force, or Vital Energy, and whether we may rightly speak of Vital Processes? These are terms which until lately were constantly on our lips as physicians and physiologists; the present tendency is no doubt to discard them from our vocabulary. Observation and direct experiment have shown that many actions and functions which could not formerly be understood as depending upon physical phenomena, that is, on phenomena witnessed in matter or substance unconnected with what is termed Organic Life, and which were therefore ascribed to some peculiar power or force superadded to physical actions, really depend upon such actions, and on such alone. Whilst recognising that many of these actions, such, for example, as Digestion, Respiration, the power of forming and maintaining the temperature of the body, formerly termed "Innate Heat," are physical actions, it is very clear, nevertheless, that at any rate a large number of the processes of what we term life, cannot even yet be explained on merely physical principles, such as we know them.

For my own part, irrespective of the moral or theological tendencies of objections, even if all the processes which we term functions of organs or parts were positively found to be referable to, and could be ranged under, physical actions, I should still detect something additional and wholly different from and sovereign to them in the fact of their coördination, and see in the mode in which they act together, and in the adaptation which exists between them on the one hand, and the wants of the entire organism and the work to be executed by individual parts on the other hand, a supervising and beneficently controlling agency or influence, using physical forces as its instrument (call it what you will) which the known laws of physical science of electricity, chemistry, and heat, &c., quite fail to explain. Even though it be granted that all movements of every object whatever, animal or vegetable, upon our earth, results from heat, of which the sun is the sole fount, yet this alone will not explain why structures so different in form and function as animal or vegetable tissues

originate from bodies apparently identical, which we call cells, nor will it make clear to us why that microscopical body which we call a germinal vesicle, yet being imperfect, but crescing in its faculty, will in one case, through secret fashioning, prove eventually to be an organism, low in the scale of animal life; whilst another such body, apparently bearing the same stamp, identical in form and chemical character, will be developed (as the complicated planetary system was from a primæval state of matter) into a human creature, supreme over the entire range of organized beings, with physical attributes so perfect, capable of intellectual and moral truth, and endowed not only with consciousness, but with conscience and free will; nor why, in one case, genius and high mental endowments, and in another quite the opposite characteristics are wedded to the same nervous cells and fibres as their media of action. Nor will it explain why one individual is born and remains sickly and liable to disease or peculiarity of features bodily or mental, and dies early and suddenly, imparting to its posterity similar proclivities, whilst another of the same stock retains vigorous health until death occurs at a good old age. Nor why again the average duration of life varies in different species of animals nor why the various developmental periods of age, each with their physiological peculiarities and aptitude for paleological derivatives follow one another in due order and regular succession.

As it appears to me all these, and numbers of other facts, connected with both healthy and diseased actions, are mysteries totally unsolved by any supposition that they are effected by what we call physical agencies apart from any other influence, or by any force correlative with known physical forces. We must recognize in every organ and tissue of every individual throughout life the general action of those sublime physical laws which govern the movements of every organism in every system of the entire universe, imposed by a grand first cause or Creator. But I cannot shut my eyes to the existence of their regulation and their adaptation for countless minute and individual purposes (of the kind which we call vital), by means of some independent and higher energy which may be termed a vital principle. I can no more doubt this than, whilst considering the various processes of some industrial manufactory, I can doubt that, although the power which originated the thousand movements which I witness arises from the different tendencies and endowments of applied steam, the direction and application of this mighty force is for many and diverse purposes ensured by the unerring hands and nimble fingers which I see presiding at work around me in every corner of the building.

Then, again, the certainty which the study of healthy animal life affords of the existence of teleological or final causes, and the numerous ways by which in disease what we call nature, procures spontaneous relief, plainly indicate that in organic bodies something more than what are called physical laws are at work, and should point out to ultra physicists that within and about us is more than is dreamt of in their philosophy. To quote the well-known lines—

"All nature is but art unknown to thee,
All chance direction which thou canst not see,
All discord harmony not understood,
All partial evil, universal good."

We as medical men have to deal with much more than the physical experimenter, and not merely with mechanical, chemical, or electrical machines. We have to do with a compound of body, mind, and soul, in close fellowship and inter-dependence, in whom the reason, the emotions, the poetical or imaginative elements, and faith in things unseen, are as real and personal as the functions of bodily organs, and we have to operate upon these materials existing, not in what we call a natural or orderly condition, but under circumstances which are so inscrutable as to appear to us eccentric and disturbing.

The question of final causes to which I casually alluded a few moments ago, is one which also has of late, as it has ever done, received much attention. Many would fain

persuade us that such causes do not exist; but do not you be so persuaded. The inquiry is a very old one, as readers of Paley well know, and the contest has been fought and settled frequently; in fact, it goes back to the times of Pericles and Thucydides, when, as recorded by the historian, on a certain occasion, the growth of a single horn from the forehead of a ram was determined by the diviner to portend success to the owner of the ram—that is, to Pericles in opposition to Thucydides. On that occasion it was ingeniously shown by cleaving the skull of the animal that the brain had not filled up its natural place, but being oblong like an egg had collected from all parts of the cranium in a point to that place from whence the root of the horn took its rise, and thus a physical explanation was thought to be given. Plutarch, however, who relates the story, remarks, "that it was no absurdity to say that both were in the right, both natural philosopher and diviner, the one justly detecting the cause of the event by which it was produced, the other the end for which it was designed."

I have lately been speaking of disease, I will now pass on to remark upon that by which we attempt to overthrow disease and its results—viz., the practice of medicine. But previously I desire to make a short digression regarding the definition of the term science of medicine. As very frequently spoken of, one would suppose that medicine was a distinct branch of knowledge cognate to, but separate from, what are termed the sister sciences of pathology and physiology.

Our knowledge does not lead us to make this classification; but we say that physiology and anatomy—that is, a knowledge of the laws regulating healthy conditions and functions—is the basis of pathology, which is the knowledge of the laws regulating the same conditions and functions in an unhealthy state. In other words, the knowledge of the laws of disease—i. e., of its causes or antecedents (which we term etiology), of its symptoms (which we term semeiology), including of necessity their discrimination (or diagnosis), of its course, function, and mode of termination (or prognosis), is that which is the so-called science of medicine. And it is in contrast, so to say, with this science, that we speak of the practice of medicine. The latter, of course, ought to rest on the former; and the supposed certain character of this, our science, is thought to pertain to, and be reflected upon, our practice.

On this point it seems very desirable that you should not be possessed with exaggerated views. I will then ask whether our practice of medicine, or of physic so-called, is anything but an art? Ought we not to keep to the term, "Art of Healing," considering it with the well-known Dr. Gregory of Edinburgh, as an "ingenious and liberal art." On the other hand, are you to be led to imagine that the knowledge which we possess of the action of remedies, and of prophylactic and hygienic measures in preventing and counteracting morbid processes, is so certain, and our general acquaintance with the laws followed by those processes so accurate that, provided one has ascertained the nature and amount of the deviation from healthy action, which is termed disease, in a given case, the application of the adequate remedy or line of treatment rationally and inevitably follows? Indeed, this cannot be said; and to claim for our practice more of a scientific or logical character than is warranted by fact, is simply self-deception or charlatanism.

On considering the various sources whence our methods of practice are derived, I think it will be found that they are somewhat as follows:—In some measure our practice may be said to be based upon a true reasoning process; and perhaps this is more especially so in the case of surgery. Analogy has led to good results, as when Pott was induced to use issues in the case of curvature of the spine, by observing that Hippocrates spoke of paraplegia being cured by an abscess of the back.

To a certain extent, our practice has no pretence to any rational foundation, being stumbled upon hap-hazard, just as it was in the earlier period of man's history, when

remedies were resorted to without any intention whatever. Ancient writers describe men as exposing their sick in the highways, so that any passenger who had been similarly afflicted might relate what he had found to be of service.

Purely so-called accidents may originally have determined the use of certain measures, as in the case of the fabled goat which cured itself of cataract by wounding its eye with a thorn, or of the slave who is reputed to have found out the virtues of water into which portions of a certain bitter wood had inadvertently been steeped.

Very recently a notable instance of disease being cured accidentally occurred in the person of a late well-known London physician, whose goitre was, I am told, effectually but very unceremoniously cured by the rough and ready method of garrotting to which he was subjected in one of our squares. I remember the case in this hospital of a patient who drank a liniment, by mistake, containing turpentine, in consequence of which he voided a tape-worm, of the existence of which he had entertained no previous suspicion.

It has been thought that in some cases herbs were originally tried and found remedial, and thus gradually but universally adopted, from the uses which animals have been seen to make of them, as in the case of the styptic plants, to which the stricken deer resorted, or in that of the Jesuits' bark, with the properties of which we are informed men became acquainted by watching its effects on the animals which gnawed the trees.

Though it is difficult to understand how, as some of the ancients asserted, the use of enemata was gleaned from watching the practice of the Ibis (Sydenham lxxv.)

Every branch of knowledge teems with instances of valuable facts having been hit upon unexpectedly and apart from research and from any mental process worthy the name of reasoning. Discovery in medical practice has also resulted from collateral researches—that is, from researches carried on with the intention of finding objects quite different from those which actually resulted. Thus, in certain cases of poisoning it has been stated that wine was discovered to be useful in counteracting baneful effects, though it was originally administered with the intention of preventing the "coldness" which, according to the doctrines of the day, deleterious agents were supposed to produce. In like manner Brandt lighted upon phosphorus (save the pun) whilst searching in the urine for a fluid wherewith to transmute one precious metal into another. Just so the search for gold in old vineyards brought about the upturning and fertilization of the soil. Thus also Columbus, for another example, fell upon the country of America unwittingly, whilst really trying to make out a westward passage to the East Indies.

In a certain degree, then, the method of our practice has been fortuitous; but the physician who relinquished the following of his profession because, as he said, he was tired of guessing, must have practised about as wisely as that other described by Moliere, who, with directly opposite tendencies, would not, for love or money, desert the theories of the schools, and treat any patient except as the faculty permitted.

But the greater part of our practice of physic rests upon actual experience, and is, in the best sense of the word, empirical.

(To be concluded in our next.)

WESTMINSTER HOSPITAL.

ABSTRACT OF THE INTRODUCTORY LECTURE.

By Dr. FINCHAM.

THE Lecturer, after a few words of welcome to the older pupils, proceeded to address himself more particularly to those who were commencing their medical career, and first alluded to the higher standard of general education which was now insisted upon as preliminary to their

special professional studies. "Do not," he said, "be discouraged by the apparent multiplicity of subjects to which you will have to direct your attention. To some, I know, this seems at first almost overwhelming, and they feel tempted to sit down in a sort of despair; but this is as unnecessary as it is wrong. There is nothing so especially abstruse in the studies with which you will be occupied but that a young man of average abilities and a fair school education can perfectly master them, if he only will do so. I say a fair school education, and I trust that the regulations of the Medical Council, compelling all students to pass a preliminary examination in ordinary school subjects, before they begin their specific medical career, will have the effect of sending up to the schools pupils who really are fit to begin their professional studies. This has not always been the case unfortunately in times past, and I am sure that all who had to do with medical teaching have formerly very often lamented a sad want of common intellectual training in many of those who have entered our schools. Some, indeed, were deficient in the very rudiments of education; it was a hard matter for them to write a piece of decent English, and their spelling was not always in accordance with the received rules of orthography. But it was even worse than this. They did not seem to have the least idea of learning, much less of teaching themselves. Habits of memory, application, reflection, analysis—all were unknown to them; and instead of learning their profession, they spent most of their time in learning how to learn, if even they achieved this. But all this is, I trust, a thing of the past. Already the standard of preliminary education is sufficiently high to keep away from the ranks of medical students those who are manifestly unfit for any liberal profession; and by the resolutions of the Medical Council at their last session, this standard will be gradually raised still higher. And this, I believe, will be found a positive boon and advantage, not only to the profession generally, the tone and position of which will be unquestionably raised, but also to many young men who, were it not that this preliminary education is insisted upon, might have entered a profession for which they never perhaps could properly qualify themselves, and which, therefore, must be practised under terrible disadvantages. Many a young man whose education has been neglected, or who, from some cause or other, has an inaptitude for intellectual pursuits, has cursed the day on which he entered one of those professions for the right study and practice of which a considerable amount of intellectual training is necessary. Such an one might have made a capital farmer or a first-rate colonist; but a doctor or a lawyer he never should have been."

The Lecturer then proceeded to give a rapid sketch of the various sciences to which the student would have to give his attention, showing how they all bore upon the great object of his studies, the cure of disease, and the alleviation of suffering. He pointed out the unreasonableness of thinking it possible to amend derangements of the structures or functions of the human body without a previous knowledge of them as they are in health; in other words, without being masters of anatomy and physiology. He urged, too, the study of chemistry; first, for its bearing on physiology; secondly, for its direct help in the diagnosis and treatment of disease; and, lastly, in its connexion with forensic medicine. The study of medicine and surgery themselves was next considered, and the necessity of attending systematic lectures on these subjects insisted upon as introductions to the most important point the student must direct his attention to—viz., clinical teaching and study. He showed how essential was this last, and how impossible it was to become a good physician or surgeon without it, just as without dissections it was impossible to become a good anatomist. Having thus touched upon the various subjects which occupy the student, both in the lecture-room and the hospital, the Lecturer next alluded to his duties and occupations when at home. "First of all," he said, "I should

strongly advise those of you who take notes of lectures, and a more useful practice it is, to write out these notes on your return home, with such additions as your memory can supply. This is a most valuable exercise, and tends more than anything else to fix the topics of the lecture in your minds. There is no better test of a man's knowledge of any subject than his ability to state it in definite categorical propositions committed to writing. This will show what he does and what he does not know. Ascertain, then, what you have really learnt at lecture in this way. And now as to reading. There can be no doubt that you ought to have a good work on each science upon which you are engaged. I shall leave it, however, to your various lecturers to tell you what those works shall be. I would rather remind you that, just as there is all the difference between lounging about the wards and clinical study, so there is all the difference between looking at a book and mastering its contents. One of the greatest thinkers of the last century in this country, Bishop Butler, thus speaks of that shallow desultory mode of reading which is, I believe, one of the great evils of the present day. Were he living now, instead of upwards of a hundred years ago, he would doubtless have denounced it in still stronger terms. He says, "The great number of books and papers of amusement which of one kind or another daily come in one's way, have in part occasioned, and most perfectly fall in with and humour this idle way of reading and considering things. By this means, time, even in solitude, is happily got rid of without the pain of attention; neither is any part of it more put to the account of idleness; one can scarce forbear saying it is spent with less thought, than great part of that which is spent in reading." Do not then read in this desultory mode, allowing ideas to pass through your minds, but making no effort to realize them and make them your own; and do not delude yourselves by supposing that, because the work you have open before you is a solid one, you, therefore, are well and solidly engaged in reading. You may skim a solid book just as readily as you may skim a novel, with just the same amount of waste of time and injury to your mental powers. Far better would it be for you to read now and then, positively for amusement, some good work of fiction, than habitually to read, even the deepest work, without making an effort to master its contents. Read then a few books, but read them well. Bear in mind the old proverb, "*Cave hominem unius libri.*" It expresses exactly what I want you to realize—that a man who has mastered a few books thoroughly is infinitely superior to one who has read hundreds carelessly—that he is infinitely more to be feared as an intellectual antagonist, because he has acquired active habits of thought; instead of being content with receiving passive impressions of subjects which have merely flitted before his mental gaze, but have left no abiding stamp behind them."

The Lecturer then went on to speak of the important subject of recreation in the following terms. "On this point the first thing to bear in mind is that habitual idleness is incompatible with the idea of recreation. For what does recreation mean? The word speaks for itself. It means a creation afresh—a renewal. Unless, therefore, mind or body, or both, are more or less fatigued and worn, there can be no need of, no right to recreation. The idle boy or man has exhausted nothing; there is nothing, therefore, which wants renewal. The industrious student, however, has a full right to recreation. Nay, it is his duty from time to time to unstring the bow of mental effort in the positive interest of his professional advancement. He will work all the better for good wholesome play, just as he will play all the better for his previous work. In continuation of this subject the Lecturer alluded to the many sources of amusement and instruction now to be found in the metropolis, and of which the student can avail himself without the slightest risk of deteriorating his moral character. He urged, also, the advantages of short excursions into the country dur-

ing the spring and summer months; on the Saturday half-holiday; but above all, he insisted upon change of mental occupation as one of the best means of recreation. "Artisans," he said, "who have been using their muscles all day, are by no means disinclined to some athletic sport in the evening, and really find relief from it. So, too, the medical student, who has been working hard at his anatomy or chemistry, will be in no small degree refreshed by spending an hour or two occasionally on some totally different subject. In this way let him keep up his classical studies, or work at French or German. Let him read, too, instructive works—*e. g.*, on history or the biographies of great and good men. All these will be of use to him by enabling him to become the fit associate of educated persons, and also because they will help him to rise above a life of frivolity, or of mere sensual gratification, by giving him an interest in something higher."

The Lecturer, in conclusion, when contrasting the position of the medical profession with that of others, spoke encouragingly. "Of course," he said, "the practitioner of medicine will have to work, but so will every other professional man; but I do hope that in future years he will have less drudgery than has sometimes heretofore fallen to his lot. Thus I have great hopes that the position of parochial medical officers will be greatly improved; and that the just claims of military and naval surgeons will be no longer disregarded. Indeed I feel sure that these changes *must* take place, if such posts are to be filled at all; for just in proportion as the standard of education, both professional and preliminary of the medical practitioner is raised, so will be his reluctance to accept underpaid and degrading appointments.

LONDON HOSPITAL.

INTRODUCTORY LECTURE.

By Dr. HEAD.

(Continued from page 237.)

AND NOW, Gentlemen, as it is general on these occasions, and indeed is one of the more important parts of the lecture, let me give you some practical advice, the fruits of my own experience, and such as, if in your position, I should be glad of having afforded me, with regard to the best manner and system in which a student of this College can best conduct his studies. With reference to this, then, let me say: first—*begin to work at once*. Be careful, above all things, to forswear procrastination. Opportunities are evanescent, and forget not that "time lost can never be redeemed." Moreover, that well begun is half done. Don't waste any time in seeing the sights and attending the amusements which this metropolis affords. If you omit them during the session you will enjoy them all the better and more conscientiously afterwards; whereas if you omit taking advantage of the opportunities the session affords, your opportunity is gone, and that for ever.

Be regular at lectures. The various subjects that form the substratum of medical learning are so intimately mixed up with each other, and with your terminal studies, medicine, surgery, and midwifery, that they form one comprehensive whole, and no subject can be glossed over without affecting your aptitude for embracing the others, and making medicine subservient to your practice. Some subjects may be more congenial to your taste; but such a plan at present you must entirely forego. Nor should any single lecture in the various subjects be omitted. One admits, indeed, that all lectures on a subject are not equally instructive, still order must be in the course. There are some lectures, and the more difficult the subject the more desirous is the lecturer to make it clear to your comprehension, that become the basis on which other lectures are built up, and by omitting which you render many others comparatively unintelligible, especially as the

chances are ten to one but that the careless attendant on lectures is equally careless in reading the subject—especially if a difficult one.

Another piece of advice I shall strongly insist on is this—*take notes of your lectures* at the time of delivery. Let them in the evening of the same day be written out afresh, enlarged, illustrated, made as nearly as possible an identical copy of the lectures themselves. The practice of doing this will recall them to your memory, will imprint them indelibly on your minds, and be a capital exercise in English composition—a faculty which is one of the most desirable accomplishments of medical men. I would say further, let your reading be adapted to your lectures, let your private reading be as much as possible an extension of the course pointed out to you by the College. I have, it is true, entered a *caveat* against placing reading in the stead of observation and the more practical duties of the profession. This is altogether a wrong use, nevertheless in its proper place reading is course of the utmost necessity; and as I fear our students lose much time in desultory reading, I am anxious to make a few brief remarks on the subject.

In the first place, read but few books. Your lecturers at this College will direct you as to the books on each subject that they desire you to read; and my strong advice would be that you should at once purchase such books, forming as they will—and what indeed they should be—the Student's library. You require for advancement in fundamental sciences affiliated to medicine no more. These books should be read over and over again, and with such reading, time should be appropriated to reflection. By adopting this method a vastly greater amount of information in a shorter time will be found stereotyped on your memory.

Again, take a chapter of the subject you are studying, try to call up to memory what you have acquired in your last survey of the matter before you review it afresh, attending well to those points where you felt yourselves deficient.

To close your book at the bewitching hours, and fall back in your easy chair, enjoying the consciousness that you have spent six hours in so advantageous a manner, will well repay your labours; whereas, to read for the same period automatically, without purpose, energy, or method, is nothing less than vanity of vanities, and will be so soon forgotten that the next morning's reflection, should you have the courage to reflect, will attest the truth of this assertion.

Another point well to bear in memory is this: always make your reading subservient to your lectures, to your dissections, to your daily observation; what you remember of your lectures should be committed to writing, compared with your notes and lectures, and supplemented by a reference to the approved works recommended you by your lecturers. Such rigid reading and reflection is difficult in its first encountering; but such a plan will strengthen your powers of observation, of reflection, and mental abstraction. You will leave your studies every evening with indelible impressions, which will serve you well in practice, and will be found to be the most permanent and valuable of your mental possessions.

Make an evening epitome of your reading. This you might collect for one week, and on Saturday with closed shutters, with blazing fire, with entire forgetfulness of the outer world, go over mentally the work of the week, write on subjects you feel deficient in, compare it with your notes of lectures, with your own scribbling, and with the approved works in your possession, and what you find you have forgotten should form the matter for that evening's deep and earnest consideration.

Use reams of paper. Nulla dies sine linea should be your reading motto. Write on any point you feel deficient in, and compare attentively your production with the authors. Thus you will get the *cacoethes scribendi*, thus you will get the reasoning, instead of parrotting your reading.

But, Gentlemen, a topic as important as the subject matter of your studies, and perhaps one still more appropriate to me whilst occupying your attention to-day, is that of the manner in which your studies should be conducted; for whatever be your energy and ambition, you will believe we have little success unless they are carried out on a good system. To this point let me earnestly draw your attention; and first I must be permitted to say a few words concerning preliminary education. You will not be prepared to make the most of these advantages unless your education has been duly attended to. True, what is done cannot now be undone, and if you have misspent the years that are passed, it is difficult, not to say impossible, to repair their loss. It may, therefore, appear both useless and unreasonable on my part to refer to the matter. Still the subject is altogether so important, and has been so generally and so seriously neglected, that one would be wrong either in season or out of season to omit any opportunity of calling to it the attention of all who can exert influence in a matter of much importance from the oldest to the youngest member of our profession.

I speak feelingly on this matter; my scholastic training was, as in the great majority of instances, a superficial, not to say inaccurate, initiation into the rudiments of Latin, Greek, and elementary mathematics. Nor were the slight advantages derived from even this training of long continuance. It was soon high time, so it was considered, that one should enter on the business of life, and so I was bound, as the fashion was in those benighted days, for five long years to a gentleman who was to teach me, in return for my valuable guineas and more valuable days, months, and years, the art and mystery of medicine and surgery. A facility of dispensing which is all one acquires at such places is well enough to possess; but then five months, instead of five years, would afford ample time for attaining absolute perfection in this accomplishment. I remember still with anything but a philosophic equanimity of disposition, the sad waste of so many years of the best portion of a man's life sacrificed at the shrine of such a moloch of a custom. Still as distinctly as it were yesterday, I remember the struggle and difficulty I had to undergo in preparing myself, during brief snatches of leisure, for matriculating at the University of London, and the hazard, pain, and anxiety which in consequence of such an early training I was unnecessarily subjected to.

It is still also fresh in my memory with what a feeling of unpreparedness and astonishment I took my place among the students in the hospital which I selected for my Alma Mater, and what struggles I had to go through, and how I was upheld only by the firm resolution of doing my duty and of overcoming one day the difficulties that spread themselves in my way.

But these remarks are egotistical and require apology.

I have been led to make them only because I suppose that I am in my early training an example of thousands of others, indeed of the general run of medical students, that my difficulties are only samples of theirs, and that so far as I have succeeded in overcoming them, my good fortune may be matter of encouragement to them in endeavouring to make good the ground which has been so needlessly and heedlessly lost.

The requisition of the Society of Apothecaries with regard to the conditions under which they consent to grant their licence to practise, has been a hindrance rather than an aid to progress in this matter. The necessity for five years' apprenticeship is a dead loss of at least five years of the best of a man's life. The permission to spend a portion of this time in attending lectures and hospital practice is a move in the right direction, and a great boon to our students. Still there is no necessity why this somewhat degrading and burdensome condition of apprenticeship should be demanded at all.

The present system, however preferable to the past, nevertheless remains a needless burden to the student. It is still too general, I fear, for the articles of bondage to be framed so as to enable the master to seize for his own

advantage as much of the student's valuable time as possible. The indenture is hardly signed before the apprentice is installed comptroller-general of the drugs. He is next elevated to the position of dispenser, in which situation he is only too fortunate if he have not to dispense the inevitable remedies to half the paupers in the parish. To this preferment is now annexed that of keeper and auditor of the books appertaining to the financial affairs of the firm. As far as the apprentice is concerned, most of the time consumed in this occupation is sheer waste, and that of the best part of a man's life.

This system of apprenticing out does well enough in trades which require an aptitude in manual labour, but really to become the custodian of a small rural surgery requires no such long laborious expensive training.

There is no advantage to be obtained in this degrading custom, either in moral discipline or medical education, at all equal to the great inconvenience involved. The Society of Apothecaries, who have already done so much for the profession, and have, it must be confessed, led the way in most of the improvements made in our professional training, would crown all their other services if they would exert themselves to do away with this requirement altogether.

How infinitely preferable for the student if he could spend the years now occupied in doing nothing, in pursuing his studies at one of our colleges or grammar schools. He would then, no doubt, if he exercised due industry, have an available knowledge of the classical languages, he might also acquire an acquaintance with the modern tongues, which will open up to him the stores of medical literature in French and German, and give him the opportunity hereafter of visiting the hospitals of Paris, Berlin, and Vienna. If to these acquirements a knowledge of the mathematics and of the elements of botany and comparative anatomy were added, he would be able not only to acquit himself well at the preliminary examination, but be prepared also to enter at once intelligently into the course prescribed for him by his college.

And in reference to this subject, I cannot help thinking that most, if indeed not all, of you might by an improvement of your leisure hour (and let me tell you in passing that this improvement of your leisure hour is a point of utmost importance, and that if wisely carried out may almost enable you to live, as it were, a second life) afford those of you who have not already done so the opportunity of matriculating at the University of London. On application you can, two years before the time you propose to go up, gain the information as to the Greek and Latin authors. The mathematics is not beyond the reach of all of you, whilst the amount of French or German required is inconsiderable. Your knowledge of chemistry and natural philosophy will assist you much in the pass, and you will then have the opportunity of graduating in medicine at this University, in which, becoming as it is more practical in its tests every year, I feel confident the students of this school would further distinguish themselves. As it is possibly the most comprehensive, so it will release you from passing any other preliminary. I cannot pass on without pressing this on your earnest consideration, and as there are two examinations every year, the determination now made and the recess after the summer session will give you sufficient leisure to prepare for the examination in January twelve months.

Mark its further advantages: you will be able to obtain the first medical degree by universal sanction that Britain or any other country can offer to the successful prosecutor of his medical studies. You will have an unrivalled number of scholarships, exhibitions, and medals fairly to be competed for. If you have been attentive in the dissecting-room, the dead-house, the lecture-room, and the hospital, you will have the pleasure of reminding yourself in your work, either here by day or at your homes in the evening, that the examinations are becoming constantly more practical, more adapted, I may say, to the traditions and practice of the London hospital student.

You will also be able to take the degree of Master in Surgery—a befitting title for the student of the largest surgical school at present existing.

The great importance of this subject must be my apology for making these remarks, for with all its improvements, the preliminary education of our profession is not as it should be; and however little we are able individually to effect, it is, I think, incumbent on all to do that little in advancing it. We require a system that shall—

- (1.) Be universally adopted.
- (2.) Not involve grievous waste of time.
- (3.) That shall enable us to begin at the beginning, not, as now, commenced in a private surgery, where the merest smattering of the whole range of medicine is acquired—a smattering which must be for the most part forgotten before you can make satisfactory progress.
- (4.) That shall enable you to feel at home in the terminology and methods employed in the various subjects of study; that shall give you a scientific turn of mind; that shall teach the dignity of science and the importance of pursuing it methodically, earnestly, vigorously; that shall consequently be effective in drilling and disciplining the mental powers, without which no progress can be made in medicine, no less than in any other branch of science.

It is the latter, the drilling and disciplining of the mental powers, which is the main object of education. This object, therefore, is the one we should set before us; this is the one we should strive to reach. The powers especially of concentration, memory, observation, and reflection.

Concentration.—Most uneducated persons when they sit down and endeavour to master a particular subject immediately discover how difficult it is to keep their minds thoroughly attentive to the matter before them. It is always slipping, as it were, from their intellectual grasp. It is dropped before they are aware, and precious time is lost before it can be again secured and operated on by the mind. A renewed effort is made, and again the subject matter is lost. Thus precious time is occupied, not in study but in repeated efforts at study, which necessarily fail; thus what might have been a pleasure becomes a source of misery, and the effort for the time being is given up in despair.

One great boon resulting from a good preliminary education is that this natural difficulty in the way of the successful prosecution of your studies is to a great degree eliminated. Strict concentrated attention, like other mental habits, can easily and best be acquired early and by degrees under the influence of enlightened and regular instructors. If you do not possess this power, or if you do not possess it to the degree that might be desired, let me entreat you to lose no effort in endeavouring to acquire it; it is the *sine qua non*, the only thing needful to all successful progress in your profession.

Till then you have attained some mastery over your mental powers in this respect, let me entreat of you to be guided by one or two plain rules in the matter, such as—

- (1) Keep to as few and necessary matters of study as possible.
- (2) Work with all your might, and not too long at a time.
- (3) Be sure never to go on without acquiring thorough knowledge of all elements, definitions, axioms, everything relative to the matter. In your progress through the enemy's country leave no half-conquered districts behind.
- (4) When not engaged in study do not let your minds be a common thoroughfare for all kinds of thought, passing through like birds of ill omen, whence you know not nor whither, useless, objectless, endless.
- (5) While engaged in study, and for that matter indeed, all through life, keep all passions, appetites, proclivities, under strict control. For it is quite impossible while the lower animal nature rules, while temptations to excessive eating, drinking, sensual pleasures be permitted, the intellectual and spiritual should bear rule and exert their rightful sway.

Another mental power you will do well to cultivate—

is memory. Although not ranking so high as some endowments, it is of the utmost utility. A student of medicine can hardly command great success without a considerable power of recalling at will his past impressions and acquirements. This is a power which, as actually possessed, differs greatly in different minds, but at the same time a power which may be by *all* increased in tenacity almost indefinitely. Nothing comes out so much under exercise as the faculty of memory. You will do well, therefore, to improve your memory, which you can easily do by regular exercise. To effect this I would advise, which is indeed a great secret, especially in the acquirement of knowledge, frequently, say two or three times a day, to exercise your memory, but only undertaking little by little—little by little—that frequently. Two table-spoonfuls, Gentlemen, three times a day. Again, renew frequently the work of the day at the end of the day, at the end of the month, and so on.

Another faculty which will be of great advantage to you, and which I hope by a preliminary cultivation of some of the natural sciences—botany, for instance, you have already acquired some measure of—is the faculty of observation. It must be plain at a glance that much, very much, of your success in the prosecution of the study of medicine, of surgery, and midwifery, will depend on the exercise of your perceptive powers, inasmuch as the elements and materials of those sciences, unlike some of pure mathematics for instance, ethics, and others which might be mentioned, that have their rudiments and definitions in the nature of the human mind itself, derive the material on which they are built entirely from the outer world, and therefore the man who is most ready and capable of getting such materials for his professional fabric—that is, the man who observes most scientifically, most exactly, has an advantage inappreciable over those who do not possess such a faculty.

Thus, Gentlemen, this business of observation is, believe me, one of your most important duties; yea, I had said almost the only source of all real-abiding professional acquirements. Some are quicker and better observers than others, but all, good or bad, may be indefinitely improved by exercise. Let none of you, however, be disappointed because you feel at first unequal in this department to others. This is a fallacy that is often very disappointing and discouraging to many of our best students, and is grounded on no real foundation, for it should not be forgotten that excellence in this, and indeed in every other department of mental exercise, does not depend upon one faculty, but on many, and often principally on those that are developed last.

A truly great observer is not, for instance, one who is simply quick in his senses and active in his disposition, but one who has intellectual insight to distinguish and compare what phenomena he sees with the outward eye. Your original weakness in actual observation, which, perhaps, inferior to other men, will in time be so assisted by your intellect, your knowledge, and other mental powers, that on the whole, and at the last, you may become infinitely greater and more successful observers of the mysteries of Nature than the men who have at first caused you such serious discouragement.

These last words remind me that you will acquire very great facilities in prosecuting your science, if to the other mental powers you add the gift of reflection. We cannot conceive of a man being successful in any calling of life without being given to frequent and deep reflection. This is, at least, as necessary to the medical as to other professions. Yes, Gentlemen, the knowledge you have obtained by observation and stored in the memory must be often made the subject matter of reflection. Your stores of information must be often taken out, as it were, compared, fresh sorted, rearranged, effects traced to their causes, the whole systematized and ready for instant production and use. Very soon this habit will be delightful, and whether at home or walking by the way, you will be much more interested in enjoying the retrospection of

your rich cabinets of mental treasures and in keeping over them watch and ward, and in thus maintaining your own right, than in letting the mind idly betake herself in observing every, the first object that crosses her path, and pleased like a child with gathering flowers and shells—matters however interesting, of no importance nor utility.

Gentlemen, I have been speaking of the demands the prosecution of our science and art will make on your time and energies, of the difficulties and obstacles to be surmounted; but I should do wrong if I were to omit the mention of the countervailing advantages, many and great, which the thorough knowledge and successful practice of our profession affords; and first, there is the personal, though necessary consideration, that it secures us an ample proportion of material profit, and moreover the position of influence, honour, respect, and affection among our fellow-citizens, in return and in remuneration for the great, often inestimable, services, which, in the exercise of our profession, we are able to bestow upon them. This, however, is the smallest of the advantages we obtain. Much more important is the fact that it, before most other occupations, expands and liberalizes the mind, and exercises and strengthens the moral and religious faculties of our common nature. That it is generally attended with the former advantages is, I suppose, a fact that none will deny.

The number of years that medical-students spend must needs enlighten and develop the powers of the intellect, nor has any profession been adorned with greater names than those which are inscribed from the time of Hippocrates downwards on the bead-rolls of our profession.

Not less true is it, I think, that our profession exercises as beneficial influence over the moral and religious instincts of our nature. What, for instance, can be more softening, what more humanizing, than the exercise of our daily duties? Or what afford more stimulus to the common benevolent feelings of our nature? The practice of our profession certainly brings before the medical man claims in this respect which it is impossible to resist. He cannot avoid interesting himself in the welfare of his patients, sympathizing with their weaknesses, and doing his utmost to alleviate their pain, and thus with greater facility than other men he is formed to a benevolent disposition of character.

This is not unfounded theory, it can be proved by facts. There is no class of men that give with such readiness so much of their time and energy to the poor, sick, and destitute, or confer upon them gratuitous services which they frequently value so much.

Another important consideration is this: that the influence which our profession has, or should have, on religious principles is altogether of a beneficial tendency. I know this is not generally thought to be the case, and perhaps there was a time when there was some ground for a contrary opinion; but I don't think this is the case now, or that it would be considered preposterous to regard a number of medical students of the present day generally as deeply impressed as any other class of men with the fact that they have other relations and responsibilities than those which concern this world. Impressed, in a word, with the truth that there is a God; that they are, each one, his responsible creatures, and that the relations between God and man is of infinitely greater importance than any other in the universe. And, indeed, on *a priori* grounds, one would suppose such impressions to be the natural result of the cultivation of medical science; no one can deeply study anatomy and physiology without being struck by the weight of evidence they give to its doctrine of final causes. Students of these sciences, if not wilfully blind, must clearly see that the organs of the body are parts of one machine, well fitted together, well designed to perform their individual functions. Comparative anatomy increases the force of this argument, for we see there the same organs changed in greater or less degree in their manner of adjustment. The general plan

is pursued yet with such variety as is in each case required by the exigency of the subject, and therefore we possess in such an adjustment the strongest possible evidences that can be afforded of intelligence and design—an evidence that most clearly excludes any other possibility.

I need not specify particular instances of these statements; in your studies in anatomy, physiology, and comparative anatomy they will crowd on your observation, and if you only look for them your ordinary studies will be brightened with perpetual evidences of the wisdom, power, and goodness of the great Creator of all things. The conclusion which you will arrive at will elevate your intellectual condition, and fall in with the desires and necessities of your moral feelings. You will confess with Paley (whose work on this subject I should wish you to study, as a work of sound reasoning, right principles, and good English) that after all the schemes of a reluctant philosophy, of spontaneous generation, of continuous development, the necessary resort is a Deity. The marks of *design* are too strong to be got over, that design must have a *designer*, that designer must be a PERSON, and that person must be a GOD.

And when we have arrived at this conclusion, that there is a God, who, of His own free will and love, and self determination, has created us, and the whole universe, erecting thereby a glorious monument of His wisdom, power, and goodness, I think we shall be able to go a step further than this, at least that we shall find no *a priori* difficulty in believing that such a Being, having already revealed Himself in creation by illuminating the dark chaotic mass with such bright evidences of His attributes, might again have revealed Himself in supplying the sorer needs of His moral and accountable beings. In a word, Gentlemen, we shall have no *a priori* difficulty in receiving such a revelation of Himself as He has actually given, for as it is quite likely that such a God as we have been contemplating in creation might reveal Himself still further and more clearly, so the revelation we possess is so worthy of Himself, so suitable to man, so supported by all evidences external and internal, that we shall be quite disposed to receive it as such, or at any rate we shall not be influenced by any absurd prejudice against such a beneficent and spiritual religion. When, indeed, we review the history of the past, it must be confessed that the relation of medicine to the professional exponents of the religious principle has been a somewhat unsatisfactory and chequered one.

Christian ministers, however, have shown signs lately of meeting men of science in a fair and conciliatory spirit.

We may hope therefore that differences will be compromised, for it is not the interest of medicine to be opposed to any of the great powers and influences of social life. Medicine can only flourish in harmony with them. Christianity has moreover—I had almost said a character—much in harmony with medical science; like medicine, it is world-wide in its influence; like medicine, ancient as creation in its origin; nor is medicine more beneficial for the body than Christianity for the soul.

And besides, Gentlemen, did not its great Author, when He would reveal the great object of His mission, take upon Himself the labour of healing the sick and relieving the poor? And again, was not the Gospel most remarkable for its broad humanity and its liberal feeling the work of a physician, styled beloved in the records of our common Christianity?

A moment—I will only add that if I have in any degree achieved in this Address what I proposed to myself, I shall in some measure at least have more deeply impressed on your minds how dignified and noble is the profession you have selected—how worthy it is of your utmost exertions—how well it can repay all the labour expended in prosecuting it, and what claims it has in every way on your reverence, enthusiasm, and love. I shall, above all, have helped you to form a settled resolution of getting to work at once—to work regularly, methodically, diligently, continuously, in submission to, and in accordance with, the

order of your College and the direction of the authorities. If you do this, I shall have no fear of your ultimate success. You will raise yourselves to the position than which few, I think, are more to be envied, that of the honoured, scientific, successful practitioner. You will maintain the dignity of the profession and the College. You will give your teachers the very best encouragement and reward they can obtain for their labours. You will make amends to friends and relatives for the anxiety and expense they have been put to on your account. You will enjoy in your own breasts the satisfaction and peace that duty well done is sure to bring. Only, Gentlemen, work, work, and work will be changed into interest, and interest developed into attachment, and attachment transfigured into love, and love will easily conquer all difficulties that beset your career. *Nihil difficile amanti.*

MIDDLESEX HOSPITAL.

ABSTRACT OF INTRODUCTORY ADDRESS

DELIVERED

By Mr. J. W. HULKE, F.R.C.S., &c.

AFTER some introductory remarks on the importance of the occasion, and a few words of welcome, the Lecturer proceeded to show the dignity of medicine from a consideration of its *subject* and of its *object*.

Its subject—The human body, so fearfully and wonderfully made that the contemplation of it filled us with awe and amazement at the beautiful order of its parts, each harmoniously subservient to the welfare of the others; at the regularity with which its complex organs perform their varied functions, leaving us in admiration of the wisdom of those laws under which this marvellous structure grows up from the simplest living unit—a tiny cell—into the perfect nature of intelligent reasoning man. And what was the object of medicine but the preservation of that perfection of structure and function which constitutes health, and the restoration of this condition when disorder has crept in.

The Lecturer insisted on the equal importance of hygiene and therapeutics, and said that it should be the aim of every student so thoroughly to master the rudiments of medicine and surgery during his hospital career, that when he went hence, he might carry away the materials out of which experience would develop the successful practitioner. In order to accomplish this every faculty must be subordinated to the undertaking, and a rigid discipline of mind and body exerted; learners must be methodical, industrious, unflinchingly attentive and persevering, and be determined to succeed, if they would secure success. None were to be discouraged by the thought that they had not these necessary faculties, because every one possessed them in some degree, and constant exercise would improve them astonishingly. Although all had not equal capacity for the same high attainments, all, however lowly, might do some little to cultivate the tree of knowledge, and steady purpose often gleams that which genius fails to snatch.

The Lecturer next pointed out the advantages of diversified methods of acquiring information, each conveying a something peculiar to itself. He warned the students against exclusive devotion to theory or to practice, telling them that the truly practical man is well read, and the well read man has his knowledge at his fingers' ends ready for instant application. He dwelt on the importance of anatomy as the groundwork on which all legitimate medicine is built, and enforced the necessity of thoroughly mastering osteology by constant companionship with the bones. He then briefly reviewed the other branches of study, and advised every student to purchase a microscope, in order that he might follow out at home the lessons taught him in the class-room. The Lecturer then spoke of the importance of regular attendance at the wards, recommending his audience not to run desultorily from bed to bed, but to keep their eyes and ears open, and to study a few cases

attentively; and above all, to become clerks and dressers. He reminded them that the end of all their work was to make them successful practitioners, men successful in healing and preventing disease. It would not necessarily make them prosperous; yet few earnest workers would fail to realize a competence.

In conclusion, reminding them that they were entering a noble profession, the Lecturer bade the students adopt the motto, "noblesse oblige," and let it even stamp their thoughts and actions; but something more than this was wanted, their own strength might fail, but they could draw from the inexhaustible source of strength, even the promises of Him who said: "My grace is sufficient for thee; as thy day, thy strength shall be."

SYDENHAM COLLEGE, BIRMINGHAM.

LECTURE BY DR. FOSTER,
PHYSICIAN TO THE QUEEN'S HOSPITAL.

Dr. FOSTER, in commencing his lecture, observed that he should confine his remarks to the scientific aspects of that branch of knowledge on whose studies some then present were about to enter, and for whose progress all must feel anxious. In making an attempt to lay before the newcomers some notion of the nobility and magnitude of the service for which they volunteered, and some notion of the manner in which they might best use their powers to advance medical science, he believed that he should pay the best tribute to the intellect of his audience (hear, hear). A preliminary inquiry into the stages through which the human mind had travelled in its endeavour to acquire scientific ideas, led the lecturer to point out that medicine, as every other branch of knowledge, had passed through two stages, the theological and metaphysical, before it reached the scientific. In the two earlier stages the mind was endeavouring to gain knowledge of the origin and nature of things, but in the last it attempted to free itself from inquiries into final causes, in order to concentrate itself on the study of facts. The great object of any science was to investigate the invariable laws to which all phenomena were subjected, and the perfection of a science was greatest when those laws were reduced to the smallest number. The sciences with which they were acquainted might be divided into two classes, according to their methods—sciences of observation and sciences of experiment. In the first, the investigator simply studied the laws which governed phenomena; he made no attempt to modify or control them. In the second, he not only sought to know the laws, but by experiment he had the power to modify and control the phenomena which he studied. Astronomy was the best example of the first class, chemistry of the second. With that distinction in mind, medicine was considered in reference to the problem it had in view: "To preserve health and cure disease." In the earliest periods of medicine the solution of the second part of the problem was only attempted by the empirical method. Afterwards, by careful observation, men came to doubt the curative action of drugs, and to rely in the treatment of their patients on assisting that tendency to recover which they named the *vis medicatrix nature*.

A science of observation taught only the subjection of phenomena to invariable laws, and by a knowledge of these laws it gave provision with regard to the appearance of phenomena, but no power to modify them at will. In navigation they recognised an art based upon that kind of science, and entirely dependent upon the exact observation of phenomena, over which man had no control. Such a position for medicine could never be accepted: generations of physicians had been struggling to raise it to something more than that. Not satisfied with merely aiding the tendencies in disease when favourable, they had ever striven for the means of modifying and controlling those tendencies when unfavourable.

Medicine long remained under the control of its earlier methods, and only sought to solve the second part of the problem, "to cure disease;" for men were long in freeing themselves from the notion that disease resulted from supernatural interference, and had only recently been able to appreciate the higher and nobler view, that every disordered state was the consequence of definite antecedent conditions, which, under the same circumstances, invariably produce the

same results. To solve the medical problem in its entirety required a knowledge of physiology, pathology, and therapeutics (applause). The late development of physiology as a science, due to the complexity of the phenomena with which it had to deal, had retarded the evolution of the other branches of medical science. The difficulty which attended physiological investigation constantly baffled the attempts made by the earlier investigators to fathom the origin and purpose of life; consequently they clung at first to theological explanations, afterwards adopted and long retained metaphysical notions.

Medicine could only become scientific by the application of experiment to her fundamental sciences, a recognition of the futility of inquiries into final causes, and the substitution of the study of phenomena in order to discover the invariable laws which determined their succession and resemblance. In order to raise medicine to the rank of an experimental science, a combination of the three methods—observation, experiment, and comparison—must be followed. The earliest advance was made by observation; the application of experiment had already given them the great discoveries of their immortal Harvey, the achievements of Haller, Bichat, Bernard, and a host of others. When applied more extensively to the study of pathology it would unveil truths equal to its greatest triumphs in physiology, and give a sure basis to therapeutical investigation. Comparison had effected grand results in the hands of its great masters, Cuvier and Owen, by the study of organs throughout the animal kingdom, from their simplest manifestation to their greatest complexity. Comparative physiology would form the foundation for the erection of that great study of the abnormal throughout the organic world—comparative pathology—which the prophetic genius of Hunter first unfolded. The progress of therapeutics, which was the most complex of the three component parts of medicine, depended on the evolution of physiology and pathology, and could only be investigated with success by those who had mastered the details of the latter sciences. Its slow advance, while it might be a source of regret, could not be wondered at by the thoughtful, for all scientific progress was ever from the more simple to the more complex (applause.) Chemistry was referred to as a science which afforded the best example of the results of a sound method of investigation; and the preliminary study of physics and chemistry was pointed out as the best means of fitting students to work with success at the more obscure phenomena of life. To train a class of students of medicine in a manner to fit them for unveiling the obscure phenomena of life, they must make a great change in their preliminary education. They must have men grounded in the truth of physical science, and familiar with the methods of scientific research. Men who, before they enter on their special task, had worked well in the laboratory of the chemist, had mastered researches in experimental physics, and comprehended the great truths of the sciences of observation. What nobler mission could their old and rich universities have than the development of such a class of workers? How much more effectually would the hoarded wealth of centuries thus employed hasten on their knowledge and perfect their civilization? They would never have such aid, however, until their views of education were sounder, until men realised the great truth in the proposition—

"To know
That what before us lies in daily life
Is the prime wisdom."

(Applause.) It was infinitely more important for coming generations to acquire this prime wisdom than to have the most profound knowledge of a dead language, or the most vivid conception of the thoughts and acts of men who lived 2000 years ago (applause.) As the duty of the practitioner was to apply to his daily work the laws of the sciences which form medicine, as from a knowledge of these laws comes provision, and from provision comes action, so in the future the duty of the practitioner would be to collect the facts and study the laws discovered by his colleagues, and analysing them with that cautious spirit which his daily work engendered, to arrange them in such a form that generalizations useful to the concrete might spring from a study of the abstract. Too wide a severance between the specialities cultivated in medicine had lately been the cause of eloquent regret. Those divisions were essential to progress, but the tendency in the pursuit of special study was to lose sight of its connexion with the general body of their science. In their eagerness to collect facts, they had cultivated the in-

ductive spirit too exclusively; the advance of their knowledge was encumbered by a formless mass of unclassified facts. To discover the resemblance, and relation of the unconnected particles which composed the bulk of their observations was the task which must engage attention in the future. The work had been commenced by some illustrious labourers, and the construction of the Cellular Pathology was one of the most recent results. On generalizations of that kind the immediate progress of medicine depended, and afterwards, when the field was better divided, and the workmen more skilled, the facts collected in each centre of activity would be reduced to order by a special class of students, whether practical physicians, or simply students of the abstract portion of their science, to whose lot would fall the task of ascertaining the connexion and mutual relations of new facts, in order to form laws which might be applied to our practice. Then medicine, no longer dependent on the blind gropings of empiricism, no longer subjected to personal dogmas, would apply to the solution of her problem the invariable laws of her science. As their knowledge burned more brightly its rays would illumine the general intelligence, and disclose in all their grim emptiness the shams which gained credence in their present. To hasten the coming of that time was the task before the students who were there for the first time that day. He hoped the nobility of the service would sustain them in the face of difficulty, that the love of truth would cheer them on to effort, and when obstacles seemed greatest and reward most distant, they must remember that honest work was never done in vain. And as they went forth to clear unreclaimed tracts in a new world of knowledge, the golden aphorism of the founder of modern science must be ever in their minds—"Homo minister et interpretes Naturæ, quantum scit tantum potest" (loud applause.)

ON OZONE

IN ITS RELATIONS TO

ANIMAL CHARCOAL.

By T. W. TOBIN.

THERE are three forces necessarily called into action in a simple combination of two elementary bodies and the formation of the resulting compound—first, a force by which each of the primary substances undergoes a decomposition or destruction of its constitution; secondly, an attractive force, a mutual affinity between the respective elements; and thirdly, a new force is created, affecting the structure of the resulting compound. The absence of, or interference with, either of the two former conditions prevents or modifies their reaction, and the chief governing principle in most instances of combinations is the inertia offered by one or both of the primary bodies to the decomposition of form. The presence of a third neutral body sometimes greatly modifies the behaviour of the two active elements, although not in itself suffering any change of constitution—a property remarkable in itself as proving exceptionable to the doctrine of chemical affinity. The action, moreover, is inexhaustible and continuous, it is in proportion with the quantity of the substance.

This peculiar action has been named "*catalysis*," but to accurately define the extent of the term would be proceeding on doubtful ground. Numerous instances occur in which the direct cause may be traced to this principle, in others it offers the best explanation as to the reactions of substances on each another. The behaviour of finely divided platinum, known as "spongy platinum" on a mixture of hydrogen gas and atmospheric air or oxygen gas is an instance in question. In the voltaic action of an acid on an oxidizable metal influenced by the presence and contact of another less oxidizable metallic body. Fermentation, the germ of decay and organic decomposition, miasmata and aroma, may even be comprehended by the same hypothesis. It is only necessary to disseminate the inactive principle, the neutral body, in the presence of certain other substances capable of being affected by it, and the resulting action takes place, leaving the inactive principle

intact for future generation. But this property is more remarkable and perhaps most practically useful in the action of animal charcoal on soluble organic matter.

This action is aptly illustrated by the following experiments:—

An alcoholic solution of gum guaiacum should be effected in the following manner:— $\frac{1}{4}$ oz. of pure solid gum in 10 ozs. of alcohol, sp. gr. 830, 4 ozs. of distilled water is to be added, which ought not to precipitate the gum. If such should take place, or should the mixture assume a turbid appearance, more alcohol must be added to render the solution clear, and the clear liquor decanted in stoppered bottles, and *unexposed to light*. The test thus prepared is for the detection of ozone or *nascent oxygen*, the substance containing which under experiment should show a neutral reaction to test paper.

One hundred grains of fresh burnt animal charcoal may be now placed in a test tube; on to it a quantity of the test liquid is poured so as to about quarter fill the vessel, by stopping the aperture and slowly turning the tube over to expose the charcoal alternately to the air, and then covering it with the liquid contents of the tube, and repeating the operation about a dozen or more times, a slight but decided change of colour of the test liquid will become perceptible; in some instances a longer time is necessary to indicate the same effect. Gum guaiacum in a powdered state is of a nearly white tint when first pulverized, but on exposure to the air soon assumes a green hue. It possesses a strong affinity for uncombined or nascent oxygen in particular, becoming discoloured from its normal condition to a purple or deep blue when in combination with it. The alkaline permanganates and chlorates yield an equivalent of oxygen in contact with the gum, both being a solution, and give the characteristic purple tint. It is, however, destroyed in the presence of a free acid.

Owing to its affinity for oxygen, the pulverized gum, as just mentioned, becomes green in contact with the air by combining with the oxygen therein. If the clear solution of the gum exposed to the air be observed horizontally under the surface, with the light coming in a perpendicular direction from above, a rich purple halo appears for a depth of one-sixteenth of an inch; it cannot be detected when looked at from above. Freshly precipitated gum, from its solution by means of water, or otherwise if free from oxygen when precipitated, soon absorbs sufficient from the atmosphere to turn it green—the effects therefore described hereafter should, for this reason, be observed shortly after the experiment.

Dr. Stenhouse and others have shown that animal in common with other charcoal possesses a peculiar property of condensing on its surface gaseous oxygen and converting it into ozone, and yet the ozone, which is known as a transmissible substance, is difficult, if not impossible to separate in its normal state from the locality of its generation. The presence and actual contact of charcoal as a disinfectant is well known, and an instance scarcely exists in which the virtue of its properties has been known to affect their influence beyond the immediate proximity of the substance. The following experimental illustration may, however, show the fact more forcibly:—A long tube is filled with fine grained dry charcoal, and a current of atmospheric air passed slowly through it, on leaving the tube the air will be found to contain no greater quantity of ozone present than previous to its entrance. If the charcoal be then moistened with spirit or water, still no additional trace of ozone will be found. The air, however, is neither deprived of any sensible amount of ozone, and yet the charcoal, during the process, possessed the full virtue of the ozonizing properties under varying temperatures also no important alteration of weight is perceptible, for the substances are but mechanically mixed, and a slight disturbance would be sufficient to alter their composition on this assumption, and vary the proportion of gaseous ozone and charcoal. Independently of these instances it is impossible for a substance to exist

in the pores or surface of the charcoal when employed as a filtering material and saturated with the liquid under operation, or if possible to exist it could hardly be replenished when exhausted by constant usage. I have known instances where animal charcoal has oxidized on 262 grains of organic matter requiring 45 grains of oxygen in an average of 150 gallons of water per day for nine and twelve months, consecutively supplying it with three-tenths of a grain per gallon of gaseous oxygen without in any way having been exposed to atmospheric air. In more than one example, moreover, the charcoal was immersed in three feet of water, and the surface of such water was exposed to the open air and sunlight each day, circumstances favourable for speedily depriving it of any air it might naturally contain.

To the chemical analyst it is a familiar circumstance to meet with certain substances combining with each other, not by mechanical mixture, not sometimes even in solution, but which in other cases unite with avidity, forming compounds impossible otherwise to effect. The simplest type illustrative of this principle is in the gases oxygen and hydrogen in mixture. So long as they remain undisturbed and maintained below a fixed temperature no change is known to take place. Chlorine and hydrogen when also unexposed to light, sulphur again and oxygen, nitrogen and oxygen, carbon and oxygen, each may exist mixed or in contact, without any change taking place, but should one or both elements of any of these combinations be freed by any cause from a chemical combination in the presence of each other, as secondary compound is at once created. Such is water, such is muriatic acid, sulphuric acid, nitric acid, and carbonic acid, such in fine are all the numerous organic compounds, with which chemistry abounds and the ultimate cause effecting the majority of inorganic combinations.

Ozone is a substance admitted by all authorities as partaking of the general properties, but differing in certain respects from oxygen. Ozone is oxygen, but oxygen is not necessarily ozone. Ozone is the oxygen of combination, whether fixed in some substance or free. When in combination it is satisfied, and loses all its characteristics of ozone. When freed it is oxygen possessing all the energy of combination without the power of reconstitution. But oxygen is not the only substance capable of being rendered nascent. The compounds of chlorides of platinum and gold are instances in which chlorine is rendered nascent by the catalytic presence of a third body. It is to this property the combinations alluded to already are due. Every element possesses the same property when newly freed from a recent combination.

Now, those substances, possessing the capacity for oxygen and combining with it, are called oxides or acids; other substances, although possessing the affinity, are not capable of uniting chemically with oxygen, but converting it into ozone. Three bodies, A B C, are present; between A and B the affinity may be represented by 4, and are in combination; between B and C there exists an affinity represented by 3; between A C by 0. A B and C may therefore be in mixture together, and the compound substance A B will be reduced when in the presence of C to 1, in its absence 4. If now another substance D, bearing an affinity to B equal to 2, and to A and C to 0 be added. When C is present D will decompose the compound A B by the superior attraction it has for A; in its absence the whole series will remain unaltered. Ozone is characteristic of the body C.

Those substances are ozonizable which have a capacity for free ozone, as just described, like animal and other charcoal platinum and other bodies. The alkaline permanganates and chlorates and like oxygen yielding bodies are ozonized. All oxygen possessing organic and decaying bodies are ozonized, for, under some circumstances, they may yield ozone.

Such is the action of animal charcoal or soluble organic matter that, if the organism is perfect and the affinities balanced, no reaction is perceptible. If, on the other

hand, the forces of attractions are in a partial state of resolution, the animal charcoal taking to itself the oxygen of the compound redistributes it into more simple and stable compounds. A subsequent analysis is found to yield a less oxidizable organic residue, slightly lessened by the amount of water and volatile gas, the product of the recombination.

And as to the source of ozone to furnish such oxidizable matter present in solution. It is uncertain whether it is obtained from the actual organic matter, or whether the mineral salts coexistent with it take an active part in furnishing this element. If distilled water, after considerable exposure to the open air, be treated with the ozone test no indication of ozone will be found to be present. If, on the other hand, water containing salts of lime, &c., be treated in the same manner, a very different result will ensue. The water seemingly increasing in its capacity for ozone in proportion to the quantity of salts present.* As might be reasonably anticipated, the least stable salt thus containing the oxygen necessary for furnishing the ozone would be found to be affected after the process. Such actually takes place in practice by filtration. The carbonate of lime held as bicarbonate in solution is lessened often to the extent of two grains per gallon. Still more conclusive is the fact that a second filtration immediately afterwards does not reduce the salts. As a negative instance also of the direct virtue of these auxiliary salts, "rain-water" containing, as it invariably does, organic matter, is found to be far more difficult to purify than water containing with it the average quantity of inorganic salts.

It is possible as referred to already to furnish ozone simply—first, by the decomposition of any substance containing oxygen in combination; second, to ozonize the oxygen of the atmosphere by animal charcoal or some other substance of which this may stand as a type; and thirdly, there is another and more important means of obtaining ozone employed by Nature in providing the atmosphere, the grand reservoir with that essential element. Water seems to bear the most intimate affinity for ozone. The atmosphere is known to contain it through the vehicle of moisture. It is found more plentifully on the face of the ocean, rarely in a covered and sheltered situation, never in an inhabited dwelling. Being an active principle its energy is quickly concentrated and expended in the numerous ways Nature has ordained for its mission. How, then, is the supply maintained to compensate for the loss thus sustained? As it is found in the presence of moisture, so it is generated by the moisture, by the vaporization perpetually going on at the surface of the ocean, by the constant evaporation on the whole extent of the globe it is maintained at a uniform quantity. But to verify this by experiment, the evaporation of ether by a heated glass rod furnishes a copious supply and will even sustain combustion with platinum wire; the ozone test—solution of guaiacum if quickly dried on the surface of paper, affords the characteristic indication of ozone in becoming green. But the following perhaps is a more conclusive experiment as to the generation of ozone by evaporation.

Two test-tubes, similar to those before alluded to, should be nearly filled with distilled water. In one case use water which has been exposed to the open air for a considerable time, say two or three hours, in the other case water which has been recently boiled. The ozone test should be applied to both at the same temperature. The result will show a prevalence of ozone in the water that has been subjected to quick evaporation by boiling, while in the other the unboiled sample, a simple precipitate of the gum, will take place uncoloured, indicating a total absence of ozone.

* The simplest manner of performing this experiment is to pour about one drachm of the water into a narrow test-tube and wring about ten drops of test liquid, the gum in which will be precipitated of a characteristic white, its normal colour, or green, in intensity according to the amount of ozone present.

ON MELANOSIS OF THE LUNGS,
AND OTHER
LUNG DISEASES ARISING FROM THE INHA-
LATION OF DUST.

By F. OPPERT, M.D., L.R.C.P.,
PHYSICIAN TO THE CITY DISPENSARY.

(Continued from page 274.)

As for anatomical microscopical researches, Guillot says the black mass exists only sparingly. When examined, the larger particles are found to be composed by many smaller ones; they may be compressed between glass, so that they are not wider than the 200th part of a millimètre, as irregular as the large masses. These molecules are as dark under the microscope as seen with the naked eye. They sometimes fill the lungs to a large extent, sometimes only partly, but visibly. It certainly may be seen by the microscope that the black colour does not depend upon blood extravasation or pneumonia. The black matter when getting deposited to a greater extent, obliterates the smallest veins and arteries, and compresses the smallest ends of the air tubes. At last parts of the lungs get so much infiltrated that they were hard, when cut like pasteboard, which had been in water, and sunk, when submerged in it.

Guillot often found the black matter and tuberculosis in the same lungs. He thought it particularly worthy of notice that both had their seat in the upper part of the lungs. The tubercles seemed to become harmless when the black matter surrounded them. It effected the obliteration of the small bloodvessels which nourished the tubercle. The walls of tuberculous cavities often contained a great deal of that black matter, and cicatrices of the lungs became black by it.

The symptoms are described in thirteen cases:—Cough often for many years mostly dry, and worse in winter time. Expectoration as in bronchitis, often black, often sunk in the vessel. Hæmoptysis supervened, but mostly near the end of the disease (hæmoptysis senilis). Auscultation and percussion are not much taken note of. The sound was often dull in the infra-clavicular and suprascapular region; râles, dry or moist, were often bronchophonia rarely found.

Cruveilhier (Anatomie Pathologique), Du Coris, humain liv. xiii. described a case of melanotic lung in a female who died of puerperal fever. He found the lungs black, and the left upper to be softened, and a cavity whose walls were black as coal. He compared the colour to that of blood-pigment altered by acids, and the softness to that of gastromalacia. [The specimen may be seen in the Musée Dupuytrén.] In 1862 some valuable cases were published by Maurice (*Gaz. Med.*, 1862); Villaret, Kuborn, Crocq. (*Press Med. Belge*, 1862), who considered the black deposit as nothing but real coal. Monneret (l'Union 1863), found the lungs of a brassfounder black. Valleix, who has published a work on internal diseases (second edition, 1866), has a very short note on melanosis. He admitted two kinds of melanosis—first, one, where, in consequence of a peculiar alteration of the cells of connecting tissue, black matter accumulating without being expectorated; the second is the minor's disease, said not to be connected anyhow with the first.

As regards German writers on the subject, Haller made an observation (Opuscula Pathologica Obs. xvii.) on black striped sputa of adult men—he had them himself. Reisseisen, in a prize essay, 1808, wrote on the black masses in bronchial glands, which he thought was brought there by lymphatic vessels, and not further divulged in the organism. Heusinger, on pigment and coal production, &c. Eisenach, 1823, comes to the following conclusions:—

1. All pigment in the body is carbonaceous.
2. Abnormal pigment is like the natural.

3. Abnormal pigment is a transformation of the colouring matter of the blood.
4. It has some connexion with the formation of fat.
5. Pigment is the atrabile mass of old.
6. It shows the prevailing venosity of the system.

Brockman has written on the metallurgic diseases in the Harg Mountains, Osterode, 1851. He considers the black matter to be pigment, and relies on examinations which Vogel and Frerichs were prevailed upon by him to make, but have not been published elsewhere. Vogel found the black matter more in the parenchyma than in the bronchi. The highest state of the disease found at the post-mortem was when the whole lungs formed a black mass. Cavities were very rare. The specific gravity of the parts not abnormal. Accidentally miliary tubercles were found; four times scirrhus tumours, and sometimes concretions.

Fluid in the pericardium or thoracic cavity were not so very rare.

As for chemical examination, it proved the existence of two pigments—one vegetable, one organic. The first did resist very much the action of acids, the last dissolved in chloric or nitric acid. One hundred parts contained 72.95 carbon, 4.75 hydrogen, 3.89 nitrogen, 18.41 oxygen. The ashes (12.48 per cent.) were composed of 10.6 per cent. siliceous matter, 1.88 per cent. sulphate of lime. By other analyses iron and phosphates were found.

As for symptoms, Brockman, in addition to those mentioned by English writers, considers the dusky hue of the face and the yellow sclerótica worthy of attention. He did not find the colliquative symptoms of phthisis in cases of pneumo-melanosis; the disease often halts for a longer time than tuberculosis. He recommends change of occupation, tonics, expectorants, and remedies which act on the liver.

Virchow's researches on pigment are well known. He describes in his works all the pigments of different colours—yellow, yellow-red, brick-red, brown, brown-red, and black; granular or diffused, free granules or pigment in cells and crystalline pigments. They are transformed from hæmatin, which may have transudated from the blood-corpuscles and diffused into other parts, and afterwards, by another process, formed into granules and crystals. But, as well, blood-corpuscles may stick together and unite their hæmatin, which then is transformed into granules and pigment in a similar manner. Micro-chemical examination proved the pigment granules to resist much the stronger agents.

A strong solution of caustic potass was one of the most effective agents. It acted the soonest on the diffuse yellow pigment, very little, or not at all, on black granules. Concentrated acids changed the colour in this order—brown, green, blue, violet, rose, yellow. The chemical analysis showed that the lung pigment was the most carbonaceous of the colouring agents. This was the order—hæmatin, cholepyrin, eye pigment, lung pigment.

Virchow considers lung tubercles to favour the production of pigment, as in children with tuberculous diseases the lungs get dark.

Pigment may be deposited in large masses in the lungs, as Virchow found in an old pauper (*Wiener Wochenschrift*, March, 1856). It then may be found in all variations of form, as granules, round, edged, crystals, which may be confounded with vegetable coal. Virchow suggests that pigment is very nearly related to bilifulvin, which crystallizes in yellow or yellow-reddish needles, both being generated out of hæmatin. In 1864, however, Virchow, relying on more recent researches, admitted that the black deposit in melanotic lungs was real coal, and the crystals as well; that even part of the lung pigment was of extraneous origin.

A rare case of black lung, complicated with tuberculosis, Barthelmess narrates in his "Dissertatio Inauguralis" (Nuremberg, 1855). The patient, a miller, had blackish or grey pelleted sputa. They consisted of mucus, pus, and pigment granules; no elastic fibres were found.

At the post-mortem there were cavities as large as walnuts, filled with grey-blackish matter. The walls were covered with this matter; the tissue underneath partly of slate-grey colour, partly quite black. In the fluid pressed out of the lower lobes of the lungs numerous pigment granules were found not dissoluble by water, alcohol, ether, diluted acids. The author in question does not differ from Virchow's opinion (in 1855), but suggests that the cause of the production of so much pigment in old people may be found in fatty degeneration of the capillaries. This leads to the escape of pigment into the circulation and congregating of it in the tissue.

Rokitansky admitted Virchow's conclusions on pigment, but this was in his edition of 1859. I have not seen a later one.

ON

URIC ACID INFARCTION AND CONGENITAL CYSTOID KIDNEY: TWO CASES.

By W. KOSTER.

Translated from the *Nederlandsch Archief voor Genees- en Natuurkunde*, Deel ii., 2e Aflevering, Utrecht, 1866, p. 169.

By WM. DANIEL MOORE, M.D. Dub. et Cantab., M.R.I.A., HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS, OF THE NORWEGIAN MEDICAL SOCIETY, AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; EXAMINER IN MATERIA MEDICA AND MEDICAL JURISPRUDENCE IN THE QUEEN'S UNIVERSITY IN IRELAND.

(Continued from page 335.)

II. *Congenital fine cystoid renal degeneration*.—*Death in twelve weeks after birth, with the phenomena of atrophica infantis*.—In the early part of last month Dr. Broers requested my assistance in the examination of the body of a child. He himself had attended the mother of the child in her confinement three months previously. The case was one of head presentation. In consequence of the slow progress of the labour the application of the forceps was necessary. As far as the trunk the child was easily born; strong traction was, however, necessary to bring the abdomen through the pelvis. It appeared afterwards that there was a very great swelling of the abdomen, dependent on a solid tumour to the right and left of the vertebral column. There had been very little liquor amnii.

The child was otherwise perfectly well developed and lived. During the following days, too, it continued normal and took due nourishment. But it did not grow, but emaciated more and more, took less and less food, was restless and troublesome. The abdomen continued always equally swollen.

In this manner life continued for some weeks. The child died of gradual exhaustion, extremely emaciated.

The idea of a great enlargement of the kidney, which, on viewing the child, immediately occurred to me, was confirmed by the post-mortem examination. Both kidneys lay, immensely enlarged, in their normal position. They exhibited a smooth, tense surface, with translucent, fine vesicles, of a brown colour and clear as water. Each was as large as the adult kidney, but had a different and rounder form, and weighed two ounces. The colon was greatly curved over the kidneys, all the intestinal loops were pushed strongly forward, the stomach upward. The supra-renal capsules were normal.

In the other organs nothing morbid was met with, except an atrophic and exsanguine condition. One kidney was injected with Beale's blue, the other was divided and examined in the fresh state. On the fresh section numberless small cysts were seen forming on the surface a very regular network. More towards the renal papillæ the cysts were fewer, in that situation there existed a firm fibrous tissue of a white colour. The size of the cysts was from microscopic minuteness to the circumference of a

hemp-seed and somewhat more. The small quantity of fluid which flowed out on section was from some places viscid and then contained small, regular colloid globules; from others it was thin, clear as water, and without morbid constituents.

In neither kidney was a distinction any longer traceable between cortical substance and Malpighian pyramids. The ureter was duly open, the renal pelvis was small, and the renal calyces were very slight. If the latter were clipped out from the pelvis, open, it was seen that there were no renal papillæ. Only in a couple of places did a trace of papilla project as a flaccid, very small nipple, which, on microscopic examination, seemed still to possess a tolerably large opening for tubuli uriniferi. The other calyces became, near the papillæ, constantly narrower, and finally coalesced with the fibrous connective tissue studded with cysts, into which the renal papillæ and further up the Malpighian pyramids were changed. There was consequently almost complete atresia.

Not all the Malpighian pyramids were equally degenerated. Some, in the region of the former papillæ, were evidently in a state of atrophy. There was there a tenacious fibrous mass; exhibiting under the microscope no trace of renal structure, but only connective tissue with amorphous granules and some fatty crystals. Others still contained bloodvessels filled with the blue injection, and remnants of tubuli with colloid change of the epithelium, but not reaching to the papillæ. Some of these formerly straight tubuli uriniferi were extraordinarily dilated, and the thickened and coalesced epithelium formed, as it were, a layer of basaltic pillars in the longitudinally divided tubule.

The bases of the pyramids, and the cortical substance completely coalesced therewith, exhibited on sections when slightly (60 diameters) magnified, a net work, which is best compared to that of a longitudinal section. The larger cysts had a smooth membrane of their own, with slightly granular amorphous contents; in the smaller cysts this proper wall was sometimes scarcely perceptible, but there was about it a great increase of connective tissue with many nuclei, whence ran little canals not distended, but often wound around the cavity. In some sections the origin of the cysts from distended, altered, and strangulated parts of the tubuli uriniferi could be distinctly demonstrated; bellied enlargements were there found as commencements of the cysts. If we viewed a section of the places where the cysts were most numerous and lay most thickly together, with the distended capillaries about them, the analogy to a longitudinal section with distended vessels was still more striking.

This cystoid renal degeneration is therefore not distinguished, in any important respects, from that described by Virchow and others. It was a typical example thereof. It is only to enable me to speak of a couple of questions, one of which is connected with my paper upon uric acid infarction, that I have detailed the examination of the kidneys.

The point I refer to is the different mode of death of the first and of this child. Further, the case leads to the consideration of the origin of atresia papillarum renum (*foetal inflammation of the renal papillæ* as it is called by Virchow) and of the origin of renal cysts, keeping in view my former essays in this journal.*

It is certainly strange, at first glance, that a child with uric acid infarction of the renal pyramids, in which probably a third or the half of the secreting and excreting system of the kidneys was still capable of performing its functions, should die of convulsions, which we think referable to "uræmic" intoxication; while another, in whom we cannot imagine how any secretion or excretion of urine was possible, should gradually die "atrophied" without any appearance of uræmia.

It may sound paradoxical, but nevertheless the assump-

* The pathogeny of cystoid kidneys, *Nederlandsch A chief Jaargang 1*, p. 196. See also *MEDICAL PRESS AND CIRCULAR*, February 28, 1866, p. 199.

tion of uric acid infarction as the cause of convulsions in the first child, seems to be rather supported than contradicted thereby. If there were always, in adults also, a proportionate relation between uræmia, convulsions, and a *high degree* of renal changes, the absence of uræmia, indeed of nervous symptoms, in the case of renal cystoid, would take away all probability from my pathogenetic view of uric acid infarction. But the reverse is known to be the case. Compare the history in my essay just quoted, which was the starting point of my investigation, with others there mentioned, and with hundreds of others of renal degeneration, whether cystoid or otherwise, without uræmia, without convulsions. We may even, *cum grano salis*, lay it down, that in very extensive, very far advanced renal degeneration, convulsions occur more rarely than during the development of the morbid process in the kidneys. Many cases of Bright's degeneration of the kidneys, of incipient cystoid, sometimes scarcely suspected during life, suddenly terminating fatally in convulsions, with nearly total atrophy of the kidneys, or with other changes as far advanced as in the case here recorded, may be brought forward as proofs. There occurs, in a morbid process in a state of development in the kidneys, something sudden, something which has as yet escaped our observation, when convulsions arise.

As to the unknown "something" I shall here say nothing more; but in the case of the uric acid infarction which has a more acute origin and course, and may rapidly increase or change, we have still more idea of it than in the slowly but surely progressing modification in the development of the kidneys, which ultimately leads to the complete cystoid degeneration.

Virchow speaks in connexion with atresia of the renal papillæ, of "fœtal inflammation." In general we are more inclined, in the explanation of an anomalous development, to assume a local inflammation as the first starting point in cases where a constriction or a closing of a tube or of an opening being given, the other abnormal conditions may be thence deduced. Thus it is among others with the theory of Herm. Meyer* respecting the origin of some anomalies in the development of the heart through *inflammation* and subsequent closing of the pulmonary artery, which should in that case occur within the first two months of fœtal life! My friend, Halbertsma,† whose lamented decease was announced to us while I was writing this essay, of whose accurate anatomical research and ingenious and reliable style of interpretation so many scientific essays, and not least that just quoted, can testify, refuted this theory, so that for "fœtal inflammation" we must substitute original abnormal course of development.

As the source of the congenital cystoid degeneration of the kidneys Virchow assumes a "fœtal inflammation of the papillæ," while the influence of the uric acid infarction, as it seems not to occur in intra-uterine life, is highly improbable. In fact, we find in the congenital renal cystoid, the apparently primary and causal changes in the renal calyces and papillæ, sometimes also in the pelvis. The last may be wanting, and the whole efflux of the urine be impossible, in which case again the congenital cystoid occurs. But what right have we here to speak of an inflammatory process?

What is the characteristic of an inflammatory process? An immense number of chronic nutritive changes, also in the adult body, are ranged among the "inflammations." But here, too, we may ask: by what right? The reason of this unavoidable defective distinction of certainly very different morbid processes lies in the defective state of our physiological and pathological knowledge. Histology has supplied more matter than pathology can encompass; or histological investigation is not yet completely or profoundly enough possible, "chemical" investigation is almost entirely wanting. Hence we consider as "chronic

inflammations" a group of nutritive modifications, which have only some characteristics in common (succulent swelling, new formation of connective tissue, subsequently atrophy). But the boundary must be placed somewhere. Before speaking of a fœtal inflammation and consecutive atresia of the renal calyces and papillæ, we should, in the absence of better characteristics, be permitted to lay it down that the renal calyces must be there, that the renal papillæ before being inflamed and subsequently atrophied, must have been completely *formed*. Should the walls of a formed renal calyx attain a state of increase of tissue, and subsequently of contraction, and if this state be followed by atresia, we might then speak of inflammation. But certainly not, if through a disturbance in the development, these parts are formed either not at all, or only defectively, and if only connective tissue be produced. A condition may then be met with, which might also be the result of a chronic inflammatory process; but the latter has not therefore necessarily existed. Rachitic alterations of bone in childhood are not attributed to an inflammatory origin; there is a condition of defective nutrition and development, for the most striking phenomena is to be designated as: "defective deposition of calcareous salts." In like manner I should not, without further proof, call a defective development of the kidney or of some parts thereof a "fœtal inflammation." Knowledge of the time when, and the manner in which, the process originally began in the kidney, would in the first place be necessary. In many cases, moreover, the idea of inflammation immediately falls away, for example, when the renal pelvis or calyces are *wholly absent*. We, therefore, give to the expression *total or partial atresia of the renal pelvis, calyces and papillæ*, preference over the name of fœtal inflammation, without at the same time denying that the latter may occur.

The question then still remains, if it existed in the case communicated by me, to what we must in each case attribute the existence of renal cystoid.

I do not believe that we can here speak of a fœtal "inflammation." The renal pelvis was properly developed, had smooth walls, just like the calyces. The last were very much extended in consequence of the colossal enlargement of the kidneys. They ran out as slender tubes, and passed in places where nothing of the renal papillæ was to be observed, as threads of connective tissue into the mass of the latter, mingled with cysts, which occupied the place of the Malpighian pyramids. The only distinct renal papilla, which I still met with at the extremity of a calyx, was small, flaccid, badly developed, had one opening visible even to the naked eye, and consisted moreover of a mass of connective tissue. The tube, which opened on the surface of the papilla, possessed a layer of cylinder-epithelium, was continued open upwards, but could not be traced further in the longitudinal sections made. Higher up we found in longitudinal sections connective tissue, cysts with a smooth proper wall, and distended tubuli uriniferi.

In place of the other renal papillæ and pyramids were found only smooth, whitish connective tissue, higher up fragments of tubuli recti, and cysts, while here and there, also without the existence of distinct renal papillæ, tubuli recti, among which many were very much distended, presenting thickened epithelium on their wall, opened into the calyces.

For the interstitial hypertrophy of connective tissue, often combined with calcareous infarction, in the Malpighian pyramids of adult kidneys, I myself formerly (in the essay referred to), proposed the name of *Nephritis interstitialis pyramidalum*. At the first glance we find so much agreement with the mode of origin of the cysts in the case here described, that we should be inclined to speak of such an interstitial inflammation. I believe, however, for the reasons mentioned, that we cannot do this, and that we must rather compare the condition of the renal calyces and papillæ in this and in analogous cases of *congenital renal cystoid with congenital atresia ani or urethræ, &c.*,

* Ueber angeborenen Verschluss der Lungenarterienbahn [On Congenital Closure of the course of the Pulmonary Artery]. Virchow's Archiv, Bd. xii., 1857, p. 497.

† Nederl. tijdschr. voor geneeskunde, 1862, pp. 705, et seq.

where the idea of "inflammatory processes" would by no means suggest itself. It is easily understood that with defective development of the canal system of the renal papillæ and of the calyces, such a complete general atresia does not occur, as with an abnormal development of *one* canal—for example, of the rectum. A great part of the tubuli uriniferi have been developed, therefore the renal function and the excretion of urine may, in fact, have still duly taken place, especially in intrauterine life, and shortly after birth. The progressively increasing cyst development in the abnormal parts of the kidneys and the enlargement of the latter may themselves have been the cause, that the original still more normal parts may also have become unfitted for their function, and are drawn into the process of cyst formation. Or the further changes of the connective tissue abnormally developed in the pyramids caused a progressive process of closing and constriction of the tubuli uriniferi. In favour of this view are the tubes irregularly distended, or very much dilated throughout their entire length, to be found in many spots among the mass, which must have been the pyramids, which tubes no longer ran to the situations of the papillæ, but were lost in the connective tissue.

The examination of these kidneys confirmed the opinion that the renal cysts arise from distention of the renal tubuli, in the cortical substance especially of the capsulæ glomerulorum. If the cysts have attained a certain development their origin from tubuli uriniferi is no longer demonstrable, and I found in the cortical substance a great number of cysts, whence one would be very much inclined to think that they had arisen *interstitially* between the displaced tubuli. But around the cavity was found much connective tissue, rich in nuclei, in which lay an undistended tubule curved around the cysts. On isolating these tubules, after boiling sections of the kidney in alcohol and hydrochloric acid, no proper wall of the cysts could be demonstrated. The connective tissue has then become dissolved or very soft and transparent, and the convoluted tubule is easily dilated.

Larger cysts have, however, a proper smooth wall, and where they lie close to one another nothing of tubuli uriniferi is any longer to be seen between them. As I remarked in my former essay, there intervenes between the period in which the cysts developing themselves from the tubuli uriniferi arise, and that in which they, very much increased in size, have a distinct proper wall, a period of transition, wherein a proper wall is scarcely demonstrable. It is for this reason that one is still so often inclined to attribute the origin of renal cysts to the interstitial connective tissue, as has been done lately by Erichsen and others. Absolute proof, that no cysts are formed in the connective tissue externally to the renal tubules is of course not to be had; but this formation becomes extremely improbable, when we can demonstrate in the different places the obstruction, distention, and constriction of tubuli uriniferi, as it is possible to do. Of this, the case I have now brought forward, supplies a confirmation, and the annexed figures may serve to represent the extraordinary dilatation which tubuli uriniferi are capable of undergoing.*

Reviews.

A MANUAL OF PRACTICAL HYGIENE, prepared especially for use in the Medical Service of the Army, By EDMUND A. PARKES, M.D., F.R.S., Professor of Military Hygiene in the Army Medical School, &c. Second Edition, pp. 624. London: Churchill and Sons.

IN preparing this second edition for the press, Dr. Parkes has added much new material and has carefully revised the old matter, although the rapid sale of the first edition has rendered any great changes unnecessary. Several fresh

* For the figures alluded to I must refer the reader to the plate with which the original paper is illustrated.—TRANSLATOR.

wood-cuts have been added, and a plate showing the microscopical characters of some of the starches. Dr. Parkes observes in his preface that he has thought it expedient, as in the first edition, to use the old chemical symbols, notation, and nomenclature, and we agree with him that if he had introduced the new ones many of those for whom the work is more especially intended would have been unprepared for the change. Since the time of Lavoisier the nomenclature of chemistry has been considered so firmly established, that any alteration seems like changing the letters in the English alphabet, and some time must elapse before the existing generation of practical surgeons and physicians will be accustomed to the novel and ingenious system by which the whole basis of chemical theory has been remodelled. Dr. Parkes's work is already so well known as an admirable treatise on hygiene in general, and on that relating to the army in particular, that we have no other duty to perform than to announce the appearance of the present edition and to commend it most warmly to the notice of the profession.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 10, 1866.

ACCIDENTAL POISONING BY STRYCHNIA.

A LAMENTABLE case of what seems to have been accidental poisoning by the administration of strychnia, has just occurred at Wardley, a village in Rutlandshire. The lady who unfortunately lost her life by this sad mischance had apparently been labouring under some nervous and dyspeptic symptoms, and was taking a mixture containing white bismuth as one of its ingredients. On the 9th of last month she asked her husband to call at the house of Mr. SPENCER of Hallaton, her medical attendant, for a bottle of her usual medicine, and a bottle was accordingly brought to her. Before going to bed on the evening of that day, she is supposed to have swallowed a dose of the mixture, but she had not been long in bed before she was seized with convulsions and other indications of poisoning by strychnia, and she died in about twenty minutes after the supervention of the fatal symptoms. Mr. SPENCER, the Surgeon from whose house the mixture was brought, was summoned to her assistance, but she died before his arrival. On his being informed that the deceased had said that she wished she had never taken the medicine, he observed that there could have been nothing in the mixture calculated to make her ill, and to show his own confidence in the innocuous nature of the medicine, he took up the bottle and swallowed some of the fluid himself; but he had no sooner done so than he became seriously ill, and, in fact, suffered from the ordinary symptoms of strychnia poisoning, from which he recovered only with considerable difficulty and after great suffering.

Such are the main features of the history of this tragedy, which was followed in due course by a coroner's

inquest, and will be concluded by a trial for manslaughter at the next assizes, Mr. SPENCER being the person against whom the verdict has been returned. The evidence of Dr. TAYLOR leaves very little, if any, doubt, that the death arose from poisoning by strychnia, for the symptoms were exactly those which would be presented in such a case, and the chemical tests proved both the presence of strychnia and brucia in the contents of the bottle, and the exact quantity of each which the bottle contained.

Now, we have not many more remarks to make at present on this most lamentable occurrence; but we cannot help offering a few observations on the indecent haste with which the *Times* has commented on the transaction, with the object, as it would appear, of having a fling, in its usual style, against the Medical Profession. In the first place, we find the column relating the case headed with the words—"A LADY POISONED BY HER MEDICAL ATTENDANT," although at the time of the report it was not even proved that Mr. SPENCER had administered the poison, and the word "accidental," which might in all charity have been introduced, is omitted. But not only was the report with this sensation heading thus presented to public notice, but a leading article was devoted to the same theme, although it is the usual, if not the universal, rule of newspapers to abstain from comments on a case until an accused person has the opportunity of making his defence.

The leading article itself, while dealing the most ungenerous blows against the Medical Profession, and, we may add, the dispensing chemists, displays the most astounding ignorance of the subject on which the writer assumes to enlighten the public. We are told, for instance, that brucia has qualities similar to those of strychnia, and is obtained from the same substance, which is all correct enough, but the article goes on to tell us that brucia is in practice a *bulky substitute for strychnia*! Then we are told, after being referred to the Pharmacopœia for the medical virtues of bismuth, that the latter substance *being a metal* is much heavier than the alkali (alkaloid?) but it happens to resemble it in appearance, *both looking like salt! with a slightly reddish tinge!* What this nonsense means we are utterly at a loss to comprehend, as we cannot conceive how a metal, like bismuth, having a lustre something between that of copper and lead, can resemble in appearance a white crystalline vegetable product like strychnia. What Dr. ALFRED TAYLOR probably said, and what this aspiring toxicologist of the *Times* probably meant, was, that the powdered white oxide of bismuth (the *bismuthum album* of the British Pharmacopœia, the subnitrate of bismuth of chemists) is like any other white powder, or indeed any other white substance. However, the text is quite sufficient to enable the *Times* to expatiate upon the monstrous carelessness of the "unhappy practitioner," as it designates Mr. SPENCER, and to denounce what it terms the "dens" of those surgeons who dispense their own medicines. It must be admitted that

the writer condemns the whole Pharmaceutical body as well as the Medical, and he even goes further and seems to call people to account for taking medicine at all. He appears quite puzzled to understand why the deceased lady took medicines for such complaints as rheumatism and neuralgia.

For ourselves we have nothing more at present to do than to express our deep sympathy with the family of the unfortunate lady, and we reserve any further remarks upon the case until the accused has been put upon his trial. Mr. SPENCER is a gentleman who has been thirty years in practice, is fully qualified, and has been hitherto held in the highest respect and esteem.

THE QUEEN'S UNIVERSITY IN IRELAND.

ON Saturday the Senate of the University accepted the new Charter which affiliates other Colleges and Medical Schools under the same constitution as the three Provincial Colleges. On Friday, at twelve o'clock, the Convocation of Graduates of two years, standing (that is, those who passed in 1864 and before that year) will assemble to elect a representative on the Senate. Inasmuch as nearly half the graduates are medical, while of the twenty-three senators only two are medical practitioners, there is only justice in the selection of a member of our profession for the vacant seat. In the London University fifteen of the thirty-three members of Senate are medical men. So many new interests will require representation, now that other Colleges have been added to the University, that Dr. Mapother's claims are much increased, for he is unanimously confided in by the newly enfranchised institutions.

We have very constantly urged the expediency of selecting men of our profession for representative places which are too often monopolised by our legal brethren. For these reasons we urge our readers who may be qualified to vote, to attend at Convocation at twelve o'clock on Friday.

THE VACANT IRISH POOR-LAW INSPECTORSHIP.

THE vacancy caused by the resignation of Dr. Purcell in the inspecting Staff of the Irish Poor-law promises to be warmly contested, and many candidates are already in the field. Amongst those who will probably present themselves are named the following gentlemen:—Dr. Roe, Killaloe; Dr. Armstrong, Blackrock; Dr. Kidd, Ballymena; Dr. Johnson, Queenstown; Dr. O'Donnell, Kilrush; Dr. Babington, Londonderry; and Dr. C. F. Moore, Dublin. The appointment is worth £500 a year, with about £150 for travelling expenses, and it increases in value according to service. The day of election has not yet been fixed, and, as we understand, the selection lies with the Poor-law Board, inclusive, of course, of its *ex officio* members—the Chief and Under Secretaries. The *on dit* is, that the post will be given to the best man, irrespective of politics or personal interest.

THE CHOLERA.

AGAIN have the warnings we have felt it our duty to utter been corroborated by the returns of the Registrar-General. Simultaneously with the issue of our last number appeared the weekly report of this official, showing not only no decrease, but an absolute increase in the deaths from cholera. In the 39th week of the year ending September 29th, there were 177 deaths from cholera registered in the London districts, an increase of 27 over the preceding week, in which as our readers will remember there were only 150. We have, however, this week only 67 deaths from diarrhoea in the place of 98 in the previous week. Taking the two diseases together, this still leaves us a balance of 4 in favour of the last week, 244 against 248. Small as the number is, looking upon it in this the most favourable light, no doubt many will feel inclined to flatter themselves that the epidemic is still dying out. But with no wish to be alarmists, we must reiterate our conviction that the figures are by no means satisfactory. For the first time during several weeks the excess in the mortality has not been accounted for by the deaths from cholera. We find that during the week, the total deaths exceeded the average with a correction for increase of population by 179, or just 2 more than the deaths from cholera. This after a series of weeks in which cholera has more than accounted for the excess in the total mortality and accompanied by an absolute increase in the number of deaths from that disease is a matter for grave consideration and shows the necessity for the utmost vigilance and most unremitting exertions on the part of the sanitary authorities. The activity of the medical officers of health has been deserving of all praise, and in a crisis like the present we are justified in demanding for them fuller powers and more adequate remuneration. Indeed it may well be questioned whether these gentlemen with all their devotion are really equal to the emergency, and whether it would not be a wise economy at once to double their numbers and afford them some means of united action, giving to their united recommendations the force of legislation. This would to some extent replace the clumsy machinery of local boards that have too often been mere obstructions in the way of improvement, by an enlightened body prepared by education to cope with questions relating to the public health. That the public would benefit by such a change, requires, we submit, no demonstration.

If anything could add to the uneasiness that may not unnaturally be caused by the figures we have quoted, it would be the disposition to extend its area that is displayed by the epidemic. Thus we find of the deaths from cholera in the week, 12 occurred in the West district; 36 in the North; 28 in the Central; 46 in the South, and 55 in the East. Of the deaths from diarrhoea, 9 occurred in the West districts; 11 in the North; 17 in the Central; 12 in the South; and in 18 the East.

The annual rate of mortality of London last week increased by 1 per 1000, having risen from 23, at which it stood for several weeks, to 24. In Edinburgh it rose to 23 from 19 the previous week. In Dublin it is now 44 instead of 27. In Birmingham it remains at 18. In Liverpool it has fallen from 52 to 47. In Manchester from 30 to 28. In Salford from 29 to 26. In Sheffield from 21 to 18. The rate has increased in Leeds from 26 to 29. In Hull from 21 to 26. In Newcastle-upon-Tyne from 35 to 36; and in Glasgow from 22 to 25.

LIVERPOOL.

It is somewhat more encouraging that the epidemic continues to decline in this borough. Out of a total mortality of 437 during the week, 116 deaths were due to cholera, while the deaths in the previous six weeks from this disease have been respectively 157, 146, 225, 145, 182, and 159. Let the authorities take the opportunity and re-double their exertions, and they may still hope that the decrease will continue.

DUBLIN.

THE deaths in this city are on the increase. Last week out of a total mortality of 268, the deaths registered from cholera reached the number of 98, having been respectively during the four previous weeks, 41, 52, 55, and 65. This gradual rise in the number is a most serious indication.

MANCHESTER.

UNLESS the utmost exertions should be made by the Board of Health, it seems not improbable that this city may yet suffer considerably. There were 14 deaths during the week from cholera of a severe type in Manchester and Salford out of a total mortality of 248.

THE CONTINENT.

OUR recent advices confirm the statements we have already made respecting the progress of the disease on the Continent, especially on the Mediterranean coast. It is useless to conceal the fact, that the disease has spread over a very wide area and is continually extending. From Naples some very sad accounts have come to hand, fully confirming the justice of our predictions respecting this beautiful city.

In Vienna during the four weeks ending September 22, were respectively 64, 107, 201 and 274. Considering that the total deaths during the last week cited were only 586, the proportion due to cholera is very large.

SOCIAL SCIENCE CONGRESS.

THE tenth annual meeting of the National Association for the Promotion of Social Science took place according to programme from the 3rd to the 10th October. The inaugural address was delivered this day at the Free Trade Hall by Lord Shaftesbury.

All the meetings except that last mentioned took place in one building—the new assize courts. In this building it has been found there is ample accommodation for the meetings of sections, committees, for soirées, and for all purposes. The reception-room was open on Wednesday morning, and among the arrivals were Lord Brougham, Lord Shaftesbury, Professor Fawcett, the Right Hon. J. Napier, Mrs. Knox (Isa Craig), Dr. Lankester, Colonel Patten, M.P., Hon. George Denman, Mr. J. H. Estcourt, and Mr. Bazeley, M.P.

The arrangements for the meeting were complete and satisfactory. Among the papers read may be mentioned one by Mr. Anthony Trollope, on "International Law of Copyright," which created great interest, in Section A of the Jurisprudence Department. In Section C of the same department an interesting paper was read by Mr. D. Hill, Q.C., on the question, "Is it desirable to carry out life sentences to the utmost, and, if so, in what cases, and under what form of discipline?" The proceedings in these sections were preceded by an address from Lord Brougham, in the Civil Court. On Friday the Hon. George Denman, Q.C., M.P., delivered an address.

During Lord Shaftesbury's visit to Manchester he addressed a meeting of his old friends, the factory workers, at the Town Hall.

Lord Shaftesbury devoted the major part of his Inaugural

Address, as President of the year, to the question with which he is perhaps more familiar than anything—the Condition of the Labouring People; and when we say that, though succeeding Lord Brougham in the office, he disappointed no one, we shall have fully established the value of his address, which thus concluded:—

“It is now time to conclude. But there are some, I fear, who will reply that I have entered on a high flight of speculation, and have left terrestrial difficulties too far below. Nevertheless, ‘It is good for us to be here.’ It is good for murmuring man to see how much of the misery that he suffers, or inflicts, is due to himself, and how little to the decrees of a merciful Creator. It is good for him to see how the principle of self-control is the grand principle of all social and individual freedom; that the sense of responsibility to God and his fellow-man, whether it be in the Sovereign on the throne, or the labourer at the plough, is the source of all that is virtuous, and dignified, and considerate, and true. Neither is there any hope of obtaining excellence, unless our aims be directed by the highest standard. ‘Be ye, therefore, perfect, even as your Father which is in Heaven is perfect.’ Surely this was said by our blessed Lord rather to elevate the efforts and the prayers, than to declare the actual powers of fallen man. And have we no guide? When at night we lift up our eyes, and contemplate the peace and splendour of the Host of Heaven, how each one is conforming to the law of its nature, and, as it were, rejoicing to subserve the universal order, we recognize an Omnipotent, yet gentle, principle that demands and receives a willing and exact obedience. When we turn our thoughts to the globe on which we dwell, we see, in all the works of the Great First Cause, the same invariable principle. It ruled at the Creation, has prevailed throughout all time, and will bless the countless ages of eternity. It is the law of kindness and of love, the law that—

“Lives thro’ all life, extends thro’ all extent,
Spreads undivided, operates unspent.”

Here, then, is the law for our ardent but humble imitation. It is rich in promise, joyous in operation, and certain as truth itself. Of such a law how can we speak but in the noblest language that ever fell from the pen of uninspired man, ‘Of this law there can be no less acknowledged than that her seat is the bosom of God, her voice the harmony of the world: all things in heaven and earth do her homage, the very least, as feeling her care, and the greatest, as not exempted from her power; both angels and men, and creatures of what condition soever, though each indifferent sort and manner, yet all with uniform consent, admiring her as the mother of their peace and joy.’”

Lord Brougham’s Address necessarily created considerable interest, both for its own qualities and the position of the veteran speaker. In the commencement he paid a tribute of regret to several distinguished members who have passed away during the year, from which we select that most appertaining to ourselves, the notice of the late Sir C. Hastings:—

“Our latest loss is also a severe one, Sir C. Hastings, who, beside his relation to our worthy secretary, was one of our most eminent colleagues. His great position, his distinguished fame in the medical world, and his rare kindness and humanity in the exercise of his profession, are lost in the service he rendered the medical body by founding and conducting the British Medical Association, which has placed medical and surgical practitioners in their just position, and given rise to the most important provisions for the extinction of irregular and pernicious practice. But his labours in the investigation of physical science, and his foundation of the Natural History Society of Worcestershire, showed how little his studies were confined to the profession of which he was so distinguished an ornament.”

His Lordship, having touched on a variety of topics, at length referred to recent events on the Continent, concluded his powerful address as follows:—

“Although the glory of war lends its horrible atrocities a false glare which deceives us as to its blood-guiltiness, in what does the crime of Napoleon, when he sacrificed thousands of lives to his lust of foreign conquest, differ from that of Robespierre, when he sought domestic power by slaying hundreds of his fellow-citizens? In one particular there is more atrocity in the crimes of the latter; they were per-

petrated under the name and form of justice, whose sanctity they cruelly profaned; but, on the other hand, far more blood was spilled, far more wide-spreading and lengthened misery occasioned to unoffending provinces by the invasions of Spain, and Switzerland, and Germany, and Russia, than by all the acts of the Committee, the Convention, and the Revolutionary Tribunal. Nor will mankind ever be free from the scourge of war until they learn to call things by their proper names, to give crimes the same epithets, whatever outward form they may assume, and to regard with equal abhorrence the conqueror who slakes his thirst of dominion with the blood of his fellow-creatures, and the more vulgar criminal, who is executed for taking the life of a wayfaring man that he may seize upon his purse. We hesitate not to shed the blood of the common felon, and even those most averse to capital punishment make an exception against the murderer. Thus there is no difficulty in prosecuting murderers, and the juries convict, who in cases of theft or embezzlement, or even forgery, would hesitate. Such is the universal horror of murder, or even of attempts to commit it, and of partial committal. Then, why do the same parties regard the slaughter of tens of thousands, some with tolerance, and some even with approval?

“One to destroy is murder by the law,
And gibbets keep the lifted hand in awe;
To murder thousands takes a specious name,
War’s glorious art, and gives immortal.”

Young, *Universal Passion*, Sect. vii.

Such is the result of war, and while men will fight and slay their tens of thousands, the crime of murder on the largest scale must go on unpunished and unrepented. Yes unpunished in this world. But our Heavenly Father bestowing free-will on His creatures hath declared them accountable for its abuse; and, administering justice in mercy towards the numbers deceived or compelled into blood-guiltiness, He condemns those that have betrayed or forced them as their accomplices or their instruments to the unspeakable and enduring torments of hell.”

METEOROLOGY OF SEPTEMBER, 1866.

MR. ALLNATT has published the following epitome of the weather during September as recorded at the Frant Observatory:—

The past month has been characterized by the prevalence of wild tempestuous gales and excessive rainfall. The following tabular arrangements, in conjunction with the analysis of my diurnal notes, will exhibit the various atmospheric modifications in the order of their occurrence. The initials denote date, cloud, wind, barometer, thermometer (day and night temperature), rainfall, ozone, hygrometer. Height of cistern of barometer above mean sea level, 600 feet. The first observation dates from ten a.m. :—

ANALYSIS.

Cloud.—On the 5th, at Leeds, the weather assumed a very extraordinary aspect. The morning was dark and lowering,

and from an early hour rain fell without intermission. At 11 a.m. the mingling of adverse currents produced sudden condensation, and so impenetrable a canopy of composite cloud as to cause a darkness as dense as that of a moonless midnight. This phenomenon lasted about a quarter of an hour, during which the gas was lighted all over the town, and outdoor occupations were completely suspended. On the 11th the sky was weird with fantastic forms of coppery stratus and heavy masses of purple cumulus, rolled roughly by opposing wind currents. On the 16th, at 11.15 a.m., the atmosphere was extremely unsettled; a chaos of wild vapours existed and an universal cirro-stratus, beneath which were masses of rugged cumulus in slow motion drifting up from S.W., and scud flying rapidly with earth's wind current. On the 19th the sun set in bright vermilion cumuli, which at a later period of the night were supplanted by streams of radiant cirri from S., which crossed the zenith and plunged into the N. horizon; and so on, with few exceptions, to the 28th; my diurnal observations repeat the existence of wild and watery skies, modifications of the varied forms of rain cloud, and the occurrence of huge radii of black cirro-stratus from N.W., which sometimes expanded over the whole face of the visible hemisphere.

Wind.—The wind for twenty-five days blew from W. and S.W. On the remaining days it came in complication with N. and E. Tropical gales from S.W., extending throughout England, raged on the 2nd, 5th, 6th, and 11th, and at other times with minor force. At Portsmouth on the 6th a gale of destructive violence culminated about midnight, and on the Kentish coast also produced great damage to shipping. On the 4th and 6th in Cornwall a hurricane raged with fearful violence, broke down fragments of timber trees, which, acting as a mechanical barrier, choked up descending streams and produced great floods. On the 11th the whole day was gusty and tempestuous, the wind dashing from S. to N. direct movement, and retrograde to S.S.E., thus making an almost instantaneous circuit of 200 degrees. On the 9th a heavy gale broke over Kingstown and the coast of Ireland, accompanied by torrents of rain and great disturbance of the sea in Dublin Bay. On the 14th the wind was again high and gusty, its main force almost due W., and its retrograde and direct action amounting to upwards of 360 degrees. In the afternoon of the 16th a gale, accompanied with squalls of heavy rainfall, sprang up and lasted some hours. On the morning of the 17th the wind was very moderate and such small circular currents (cyclones) prevailed that the vane of the weathercock on several occasions described the whole circuit of the cardinal points. On the evening of the 18th the wind was high, paroxysmal, and gusty, and again on the night of the 20th, after a lull of two days. In the early morning of the 21st a wild tempestuous gale raged some hours, with heavy rainfall. On the 24th, at 11 p.m., a thermometric wave of cold air passed over, which sent down the register 5 deg., and produced transient condensation, which in the course of half an hour passed away.

Barometer.—The highest point reached here (600ft. above sea level) during the month was 29.70 in., on the 18th; and the lowest 28.80 in., on the 22nd, so that the intermediate space of time between the *maximum* and *minimum* was only three days, and the whole variation was 0.10 within the inch.

Thermometer.—The mean temperature of September last year was 63.09 deg., thus exceeding the average of twenty-four years by 7 deg., and upon the whole month it was by 1½ deg. the highest on record. In the past month the mean here was 7.06 deg. lower than that of last year, thus bringing it into close proximity with the general average of the season.

Rainfall.—Rain fell in England every day from the 1st to the 27th, and amounted in the aggregate to upwards of 6½ in. On the 5th and 6th, in various parts of the Midland Counties, meadows were submerged and all the low-lying lands were visited by disastrous floods, grain crops were destroyed, and in Leicestershire the turnpike-roads in several places were laid under water. At Plymouth such rainfall had not occurred for half a century as that which descended during the week ending the 8th, when the ancient and picturesque bridge across the Plym and other structures were swept away. In Cornwall the low lands presented the appearance of a lake, and great damage had been sustained. At Malton the fall was so great as to obstruct the drains, convert the streets into rivers, and submerge the basements of several houses. The aggregate rainfall of the month was upwards of 4 in. above the average.

Ozone.—Somewhat below the mean, but there was no period of antozone. The *maximum*, or 10 deg., was reached on fifteen days, and the *minimum*, or 5 deg., on one day.

Mists.—Fogs, light mists, and abundant dews have occurred throughout the month, sometimes producing complete atmospheric saturation, when external objects streamed with the superabundant moisture.

Lightning and thunder visited the North and East Ridings of Yorkshire on the 16th, and on the 13th two slight shocks of an earthquake were felt at Budleigh, Devon, and several adjoining villages.

Correspondence.

MEDICAL FEES IN NOVA SCOTIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Herewith I enclose you a copy of the fees of the Physicians of the City of Halifax, Nova Scotia, having a resident population at the last Census of 25,000 inhabitants, Navy, Army, Dock Yard, &c., excluded; number of Physicians, 19.

	Maximum.	Minimum.
	£ s. d.	£ s. d.
Consultation Visit,	1 3 4	0 11 8
Opinion, or Verbal Advice,	1 5 0	0 5 0
Letter of Advice, or Certificate,	1 3 0	0 5 0
Visit by Day,	0 5 0	0 2 6
Do. by Night,	1 0 0	0 10 0
Detention per hour, in addition to Fee,	0 5 0	0 3 9
A Visit to the Country, per Mile,	0 5 0	0 5 0
Detention in the Country, per Day,	3 10 0	1 3 4
Lithotomy, Hernia, and other Capital Operations,	20 0 0	10 0 0
Amputation of Mammary Gland, or Extremities,	5 0 0	2 10 0
Removal of Tumours, Tonsils, Fingers, &c.	2 10 0	1 10 0
Hæmorrhoids, Fistula, &c.	2 10 0	1 10 0
Reduction of Fractures, Dislocations, &c.	2 10 0	1 5 0
Veneral Affections (medicines extra)	5 0 0	1 5 0
Introduction of Catheter,	0 10 0	0 2 6
Vaccination, Cupping, opening Abscess, &c.	1 0 0	0 5 0
Dressing Wounds, Bleeding, Drawing Teeth, &c.	0 5 0	0 2 6
In addition to the above, subsequent attendance to be charged as in ordinary cases.		

MIDWIFERY.

Attendance on all ordinary cases,	5 0 0	2 0 0
Instrumental Delivery, Turning, Hæmorrhage, &c.	7 10 0	2 10 0
Travelling Fees per Mile additional,	0 5 0	0 5 0

As every physician is his own apothecary, he charges for medicine whatever he thinks proper.

In the country our fees are nearly the same, only we pay no visit under 5s. Mixtures are generally 1s. 3d. an ounce; powders from 5s. to 7s. 6d. per dozen; a single powder 1s. 3d.; draughts 1s. 3d. to 2s. 6d.; blisters from 2s. 6d. to 7s. 6d. They seldom dispute the Doctor's bill, only when pay day comes they will ask you always to take something off. You will always get the full amount of your bill if you add a given sum, the taking off of which always pleases them.

This province is very little more than one hundred years in possession of England, and if you will compare their fees, I think that poor Nova Scotia will bear off the prize.

Most of the Army Medical Officers practise, as any resident Naval Officer, the latter being almost invariably called in in cases of danger and difficulty.

Their fees are optional, though they are generally handsomely paid. In cases of difficulty and danger, particularly in midwifery, they will pay you almost anything, unless it is ridiculously extravagant.—I am, Sir, your humble servant,

ALEXANDER LANE, M.D., R.N.

Bishop's Castle, Shropshire, 1st October, 1866.

MEDICAL CURRICULA AND THEIR USES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you allow me a short space in your truly valuable columns for some observations on the present Medical Curriculum. Your issue of your "Students' Number" has been of vital importance, and I may say a boon to the profession in general, because for one thing it shows up the most absurd anomalies in existence. A talented young fellow with little means, anxious to become a physician, stands no chance whatever with the present regulations:—to accomplish fully and fairly the object they have in view would absorb too much valuable time, and gain absolutely nothing at last. I admit the necessity of a knowledge of Latin to a certain extent to enable him to write prescriptions correctly, but beyond that it is really time lost. Will the knowledge of Greek and ophyphilos enable me to cure dysentery? Will a knowledge of all the other extra &c. &c.'s, enable me to set a broken leg, cure the cholera, or render any service whatever to a patient? Even suppose I could speak twenty different languages, and could talk glibly enough about any useless theoretical nonsense—Aye, or talk high double Dutch coiled against the sun. Sir, I like study, I like learning, I love it; but talent is not hereditary, the present regulations are only made for the "Grinders," they will certainly raise their fees and make handsome support. Regarding certificates, which the Navy Board deem so indispensable, I look upon them merely as receipts for money paid. Examiners possessing talent should wipe such nonsense off their roll. What do they signify? "Oh! says the professing examiner, I see you have paid your fees, pray, sit down." Now, if the "grinder" has done his duty, and the fellow has any brains at all, he is all right, he will pass to a certainty. What is it, when, where, or how a young man has studied, if he can answer all questions asked? I would adopt a different method, I would pass for surgeon in the dissecting room, for botany in a garden. As accoucheur a certificate of something more than mere attendance is requisite, one of ability, not one of fees should be given; yet the grinder will screw him up. The Naval examinations are most amusing—certificates are the order of the day there—third or fourth class young men answer them very well, because they are actually seeking a livelihood, and the board know that full well, if they could do better they would never go there. I wanted one of my sons to enter the Navy, "No, father," he said, "Never, and to be treated as you have been!" He is now making about £600 a year. What is the reason we never hear of anything extraordinary from the Navy in your columns? We never get a sight of those gold medal journals. Is there really any value in any of them? if so, why not publish them? any discoveries in medicine or physics, any new mode of treatment? but these are quite foreign to the Naval department. Why not give a student during his last six months, six beds to himself and let him prove his skill, both in medical and surgical wards? Why not let the same operate in the hospital? They are sent out to the world qualified, then why not see that they actually are so, before you send them out?

Are pauper lives too valuable, or do they like to have all the operations to themselves—to see themselves in print—More in my next.—Your obedient servant, M.D., R.N.
October, 1866.

The profession will, we think, agree with us that it is better without the "talented young fellow with little means," whose acquirements are such that he would "stand no chance whatever under the present regulations." It is hardly necessary to point out to our Correspondent that the education essential to a gentleman's profession is not demanded as a test of capacity to set broken legs, but as evidence of a certain amount of mental culture, without

which the most skilful leg-setter in the universe is only a clumsy craftsman, unfit for the trust of life and death.—
Ed. M. P. & C.

POOLE FUND.

The following letters have been received by the Hon. Secretary, in reply to the Circular which we published in a late issue, and in aid of the Poole Defence Reimbursement Fund:

"DEAR DOCTOR.—I enclose ten shillings towards the expenses of this flagrant case.—Yours faithfully,
"E. D. MAPOTHER.

"Dublin."

"DEAR SIR,—I have great pleasure in contributing 10s. towards defending the action unjustly brought against Dr. Poole.—Yours very faithfully,
"T. HAYDEN.

"Dublin."

"MY DEAR DR. ARMSTRONG,—I cordially enclose ten shillings towards the 'Poole Fund,' and conceive it to be not only the duty, but privilege of the profession to subscribe to such a cause.—Most truly yours,
"R. STEWART,
"Belfast."

"MY DEAR ARMSTRONG,—I enclose ten shillings to the 'Poole Collection,' with best wishes for your success in this and all your other efforts for the benefit of our brethren.—Yours faithfully,
"CHARLES BENSON.

"Dublin."

"DEAR SIR,—I have much pleasure in sending ten shillings towards the 'Poole Fund.'—Yours very truly,
"A. H. McCLINTOCK.

"Dublin."

"MY DEAR SIR,—I fully agree with you that Dr. Poole's case is one which must enlist the sympathy and support of the profession. With pleasure I enclose an order for the 'limited subscription.'—Yours faithfully,
"R. G. H. BUTCHER,

"President, Royal College of Surgeons, Ireland.

"Dublin."

"DEAR SIR,—I have much pleasure in sending ten shillings to aid Dr. Poole's defence against the late absurd action.—Your obedient servant,
"R. UNIACKE RONAYNE.
"Youghal."

"DEAR ARMSTRONG,—I have much pleasure in sending ten shillings towards the 'Poole Fund,' it would be well if the plaintiff could be punished. We are the hardest worked and the worst treated men in creation.—Very sincerely yours,
"GEORGE BRASSINGTON.
"Rathgar."

"MY DEAR DR. ARMSTRONG,—I send ten shillings to the 'Poole Fund,' and sincerely hope that the profession will respond to your most just appeal.—Yours faithfully,
"W. R. WILDE.

"Dublin."

"DEAR DOCTOR,—I am sending your circulars (Foley v. Poole) round, and will remit proceeds in due time.—Yours faithfully,
"ZACHARIAH JOHNSON.
"Kilkenny."

"MY DEAR DR. ARMSTRONG,—I feel much pleasure in sending ten shillings to the 'Poole Fund,' and sincerely trust that no medical man who has got a circular will refuse to contribute to so just a cause.—Yours very sincerely,
"M. V. BOURKE.

"Limerick"

"DEAR SIR,—Please put down my name for ten shilling towards the 'Poole Fund,'—Yours very faithfully,
"CHARLES PHILIP CROKER.

"Dublin."

"MY DEAR DR. ARMSTRONG,—I received your circular, and have much pleasure in sending ten shillings to the 'Poole Fund.'—Yours faithfully,
"GEORGE H. PORTER.
"Dublin."

"DEAR DR. ARMSTRONG,—I have much pleasure in forwarding ten shillings towards the 'Poole Fund,' and hope that no member of our body had to do with such a detestable proceeding.—Faithfully yours,
"P. O'ROURKE.
"Ennisorthy."

"DEAR DR. ARMSTRONG,—I send ten shillings to the 'Poole Defence Fund,' and deeply sympathise with Dr. Poole in having to defend so nefarious an action.—Ever yours sincerely,
"THOMAS SANDIFORD.
"Castlemartyr."

THE RINDERPEST OF THE PRESENT TIME,
AND
THE CATTLE PLAGUES OF PAST AGES,
IN THESE ISLANDS,
AND ON
THE CONTINENT.

By THOMAS MORE MADDEN, M.D., M.R.I.A.,

LICENTIATE OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND; MEMBER OF THE ROYAL COLLEGE OF SURGEONS, ENGLAND; LICENTIATE OF THE FACULTY OF PHYSICIANS AND SURGEONS, GLASGOW; AUTHOR OF "CHANGE OF CLIMATE IN PURSUIT OF HEALTH," "THE CLIMATE OF MALAGA," "OBSERVATIONS ON INSANITY AND CRIMINAL RESPONSIBILITY," ETC., ETC.

PARTS III. & IV.

SKETCH OF THE HISTORY OF CATTLE PLAGUE ON THE CONTINENT AND IN ENGLAND TO THE PRESENT TIME.

The early history of cattle plague on the Continent and in England is quite as obscure as in Ireland, and it is some satisfaction to find the accounts of the disease given by our ancient Irish annalists are not inferior to those left by contemporary writers who observed the same epizootic in other countries. In the reference to the murrains mentioned by Plutarch (id *Romulus*, B.C., 753), by Livy (Lib. iii. et xv. B.C. 404 and 212) or by Tacitus (*Annales* Lib. xvii. in the years 60 and 190. A.D.), we find no description of the symptoms by which the disease could be compared or identified with any now existing cattle disease.

The first account of a murrain apparently identical with the rinderpest, is that of the cattle plague of the year 307, cited in Ozanami's *Histoire des Maladies Epidemique, &c.*, vol. v. from Cardinal Baronious, who terms it the "Hungarian Fever." It was also described by Gregory of Tours, in the 11th book of his history. In the sixth century, and in the three following ages it repeatedly overran the Continent, but does not seem to have invaded England before the year 986, and even then there is considerable doubt whether the murrain resembled the modern cattle plague or not. For according to Dr. Short, the distemper of the year 986 was dysentery. He says:—"Two great plagues afflicted England, a mortal fever among men and a great deadly flux among cattle. (*History of the Air, &c.*, 1749, vol. ii. p. 91.) In 1041 we read that "This whole year was frightful in England for both distemperature of the air and great death of cattle, whence arose a famine which lasted seven years." In 1115 there was another murrain in England, and from 1130 to 1132 there was so great a mortality among the lower animals that we are told, "of ten yoke of oxen, not one was left alive, and out of two or three hundred swine scarce one was left alive; fowls also died (*Anglo-Saxon Chronicle*.) In 1223 murrain raged in Germany and France, and soon afterwards a similar epizootic appeared in Ireland.

In 1252, there was a great drought from Easter to Michaelmas, followed by murrain in England (*Stow's Chronicle*). This murrain is said by other early writers to have been caused by the growth of rank coarse grass late in the year when the rain at last came after the long drought, and they add that this coarse grass filled the cattle with "gross humours and thus gave rise to murrain, especially in the fens of Norfolk and the South of England." From 1314 to 1319 (according to *Stow's Chronicle*) murrain again prevailed in England. This commenced after a very wet season, and at the same time fever and dysentery were epidemic among mankind.

In 1347-48, well known as "the year of the black death," cattle plague followed the fatal epidemic and occasioned a vast destruction of cattle. In 1441, epizootics prevailed among the herds in Germany and Italy.

In 1517, another "great murrain of kine" occurred in England. This it may be observed was shortly before the appearance of the "great sweating sickness in England. In 1581 "a sore plague of strange mice," says Dr. Short,

"was observed in Kent and the marshes of Essex, suddenly covering the earth, and gnawing the grass roots, this poisoned all field herbage, for it raised the plague of murrain among the cattle feeding on it."

The great epidemic pestilences of the seventeenth century were also generally preceded or accompanied by cattle plague; and very often the disease among men was ascribed to the use of the flesh of plague stricken-cattle.

In 1709 the rinderpest was brought from the Russian Steppes into Dalmatia, and thence was carried in the train of the Austrian army into Italy in 1711. Commencing near Padua it invaded the Roman states and extended itself to every part of Italy, remaining in the Peninsula for seven years, during which time it destroyed upwards of 180,000 head of cattle. From Italy the murrain spread into France on the one side, and, through Switzerland, into Germany and Holland on the other. These countries alone are said to have lost about a million and a half of cattle by this distemper.

In 1714 the cattle plague appeared near London, having it was said been imported from Holland. Prompt measures of precaution, differing little from those enforced by Pope Clement XI. in the Roman states, were adopted by the government, and the disease did not spread, the total loss occasioned by it, being estimated at less than £24,000.

Returning now from England to the Continent, we find that the cattle plague did not cease in Holland until the year 1723, having destroyed about 200,000 head of cattle in that country. It still lingered in Germany, and was widely diffused throughout central Europe, during the war of succession, by the cattle driven after the contending armies. Between the years 1740 and 1748 the cattle plague is stated to have swept away close on three millions of cattle on the Continent.

In the commencement of the year 1745 the rinderpest was again brought from Holland into England, where at first it diffused itself so slowly as to attract no attention on the part of the government. But in a few months it assumed its characteristic severity; and in November, 1745, a cattle plague commission was nominated, and cattle inspectors were appointed to examine all suspected cattle, to kill the sick beasts and destroy their carcasses and hides. The progress of the disease was not at all arrested by these measures, for it lasted between eleven and twelve years, and did not decline till it had infected almost every part of England. The loss of cattle during the epizootic is calculated at between six and seven hundred thousand, and in the "Gentleman's Magazine" for April, 1748, I find it stated that the government had already paid £100,000 as compensation for the stock destroyed by the official inspectors.

In 1775 the cattle plague raged in the south of France, and was described by the celebrated Vicq. d'Azir, and twenty years later it again invaded Lombardy. From 1806 to 1818 a less virulent form of rinderpest prevailed in central Italy. In 1812-14 the cattle plague was imported into France by the commissariats of the allied armies, and was written upon by M. Ozanam (in his *Histoire Maladies Epidemiques*, vol. v.), and by M. Gohier (in his *Memoire sur l'Epizootie des Bêtes à Cornes*). The treatment proposed by these writers consisted in blood letting and the antiphlogistic regimen in the first stage, and in the second stage setons were employed, and stimulants were freely administered. So far my own researches into the history of the cattle plagues of former ages.

The history of the rinderpest of late years has been elaborately traced in the various official reports on the disease in England, as well as in the medical journals of the time, and I have had recourse to these sources to enable me to complete this sketch of the history of cattle plague. In 1827 the rinderpest was carried into Germany from Russia. In 1841 it broke out in Egypt, and in three years it destroyed 350,000 head of cattle there. From 1844 to 1851 it prevailed in Austria, and in 1853 it was again brought into Lower Austria from Poland.

During the Crimean war rinderpest was introduced by some Steppe cattle among the stock of the commissariats of the French and English armies. In 1857 it was reported to prevail in northern Europe, and the importation of cattle into England from the infected countries was prohibited. In 1863 the disease showed itself in southern Russia and Poland, where it raged during the civil war of that year.

In June, 1865, the rinderpest was observed in England. The Cattle Plague Commissioners in their first report state that the disease was first noticed at Lambeth on the 24th of June, 1865, in two Dutch cows, which had been recently purchased at the Metropolitan Cattle Market. Early in July it appeared in Norfolk, and thence rapidly diffused itself throughout Great Britain, with the exception of twenty-two counties, which have escaped up to the present time. In February, 1866, the rinderpest reached its maximum; and in the week ending February 17th, no less than 15,706 animals were attacked, and of these only 2,710 recovered. From this period the disease commenced to decline; thus in the week ending September 1st, the number of cases of rinderpest amounted only to ninety-nine, being a decrease of forty-nine on the preceding return.

This would not be the place to speak of the various measures taken by the authorities to arrest, if possible, the progress of the cattle plague, nor to enter on the effects of the orders in council. Royal Commissioners were appointed in September, and an Act of Parliament framed on their recommendation was passed in February, 1866, by which the measures resorted to in the epizootic of 1745 were, in substance, re-enacted.

The weekly return issued by the Cattle Plague Department of the Privy Council Office, on the 17th of August shows that from the outbreak of the disease in June, 1865, to the middle of August, 1866, the total number of animals attacked by rinderpest in Great Britain was 252,927; of these 124,268 died, 84,372 were killed, 33,292 recovered, and 10,995 are unaccounted for. That is, one in every nineteen head of cattle in England, Scotland, and Wales, has been attacked by rinderpest; and 862 of every 1000 animals infected have thus been destroyed. Besides this, the disease attacked 6,393 sheep, of which only 913 appeared to have recovered, or at least are unaccounted for.

THE CATTLE PLAGUE OF THE EIGHTEENTH CENTURY: ITS CHARACTER AND TREATMENT FROM CONTEMPORARY WRITERS.

From the history of the cattle plague to the consideration of the opinions of those who observed it in former times, as to its prevention and treatment, is a natural transition. The latter branch of this inquiry is, however, completely ignored by many recent writers on the subject. Yet it must be of importance to know something of the medical opinions of the past concerning any disease, whether it be epizootic or epidemic, for some knowledge of the measures which were formerly adopted in the treatment of an epidemic malady, and of the results of those measures, might often aid us materially, under similar circumstances, in combating the same forms of disease when they recur.

There is, however, a great tendency now-a-days to overlook and neglect the medical experience and observations of our predecessors in the healing art, and sometimes their opinions are spoken of with positive contempt by those who are, perhaps, least acquainted with their works, or who entertain what I fear is a somewhat exaggerated idea of the superiority of modern science over the knowledge of the past. But if we consult the older writers on the subject of this essay and compare them with those of the present day, we will, I think, find less evidence than might be supposed of improvement, either in the descriptions of the cattle plague or in its treatment, which may still be spoken of in the words employed by Lancisi in 1714:—"In our experience in Rome," he says, "many remedies we found useless, many hurtful, and some few

seemed useful." Had the accounts of past epizootics been more generally known, it might have saved the loss of time occasioned by the trial of the so-called *infallible specifics*, and new plans of treatment proposed daily in the public journals in England last autumn; and during that time more rational and effective remedial measures might have been devised; for with hardly an exception the treatment suggested as novel during the early months of the rinderpest in 1865 had been recommended in similar terms in the English periodicals of the middle of last century, and had been then tried with similar failure.

With these views I have endeavoured to present here a short account of the various plans of treatment suggested in the periodical press of England during the long and severe visitation of cattle plague from 1744 to 1755. The journals I consulted chiefly were the "Gentleman's," "London," and "Egshaw's" Magazines, which, and especially the "Gentleman's Magazine," then supplied to some extent the want of any separate medical journal. I have also referred to some of the pamphlets of the time on this subject, and I have sought to preserve, as far as possible, the words of the writers in the following analysis of their opinions.

A short time before the cattle plague broke out in England in 1744, an excellent essay from the French was published in the "Gentleman's Magazine." This article was entitled—"Observations on the Contagious Malady among the Oxen and Cows in Franche-comte." After some preliminary remarks, the disease is described thus—"It is always preceded by a shivering and trembling of the limbs, after which follow bad febrile symptoms, such as difficulty of breathing, a dryness on the tongue, loss of appetite, and unusual indolence, heaviness and weakness, so that they are scarcely able to support themselves on their legs. Their eyes are either dull or inflamed and sparkling, and are usually watery, and their moanings are expressive of great uneasiness. In their stomachs is observed a crudeness in their food even four or five days after it has been taken. In the affected parts we observed after death purulent matter and black or livid gangrenous spots in various parts of the intestines. In the plague among cattle in Venice in 1711, there were pustules over the whole body, according to Ramazzini's account. But instead of these pustules an eruption of vesicles on the tongue and throat accompanied the cattle plague of 1713, in the ecclesiastical state, according to Lancisi. "Effectual remedies are not yet found out. On the principle of bleeding being a remedy for all inflammations, it is very proper to take away blood from the affected animals. The next day purge the animals with Epsom or Gluber's salts, if the distemper is in its first stage, but if otherwise purging must not be used. A seton in the neck of affected beasts is next advised. Lancisi would not give the infected animals any solid food, but only cooling and nourishing drinks, such as white water, that is a water in which a handful of meal or hay has been steeped. Ramazzini further enjoins that nothing should be given to them cold.

The most essential precaution is to keep the cattle from those that are infected. Those who look after them should take care not to carry the contagious air in their clothes, and that such as wait on the infected animals should put on a kind of surtout of cerecloth when they go into the stalls, and put them off when they come out again. The beasts which die of the plague should be buried deep in the ground and no use be made of their flesh. Pope Clement XI. went farther, and ordered that the dead bodies should be cut into quarters, and buried with lime in holes made ten feet deep, or twelve, when there was no lime used, that the ground should be stamped hard, and that the holes should be dug at a distance from the public roads. Lastly, guards were appointed to cut off any communication with the infected countries, these precautions stopped the progress of the infection; and what farther contributed to it the Pope prohibited the usual fairs of such cattle.

"As to the precautions with regard to men, they ought

to abstain from the flesh of beasts that have died or have been infected. . . . For Ramazzini observes that using the beef even of such animals as appear sound, may in times of cattle plague be dangerous.

"Great care must be taken not to give any strong purgatives when once the inflammation is formed. And in this case, hot remedies are no less dangerous. Ramazzini would have two ounces of quinquina infused in ten or twelve pounds of some simple water, or cordial tincture, and this quantity divided into five or six doses, two of which to be given every day at the beginning of the infection."—"Gentleman's Magazine," November, 1744, pp. 544-550.)

In 1745-46, the English magazines were filled with communications on the nature and treatment of the prevailing cattle plague. In November and December 1745, Dr. Mortimer, secretary to the Royal Society, read papers before that body giving an excellent description of the symptoms and pathology of the disease. In the "Gentleman's Magazine," November, 1745, a correspondent describes the epizootic then raging as "a violent inflammatory fever, occasioned by feeding principally on grass, which this year from the wetness of the season has been more juicy than common." The idea that cattle plague is connected with the state of the herbage on which the cattle feed, is, as I have shown in the last chapter, a favourite theory with the ancient chroniclers. And in the eighteenth century this opinion was commonly held. Thus, in the "Gentleman's Magazine" for February, 1747, another writer also attributes the cattle plague to the severity of the preceding year, by which "the finer and sweeter species of grass were destroyed, and the growth of coarse rank vegetation was favoured."

In the January number of the "Gentleman's Magazine" for 1746, the use of tar as a prophylactic and of the tops of fir trees as food is advised. The use of tar seems to have been general throughout England. In September, 1747, was published "A receipt for the distemper of cows, from the treatise of tar water, by J. Prior, Esq., of Dublin." And in the December number of the "Gentleman's Magazine," there is a letter testifying to the properties of tar in cases of cattle plague.

In the "Gentleman's Magazine" for 1747-48, we find constant allusion to the cattle distemper. In April, 1748, one correspondent advises that the tips of the ears of the infected cattle should be cut off and cauterized, and that tar should be administered internally as well as applied externally to their noses, hearts, and sides. In June, 1748, a Mr. Montgomery of Yorkshire, writes to say that he saved six out of seven infected cattle by the administration of a piece of venice treacle the size of a walnut, dissolved in a wineglassful of brandy, and given in two quarts of hot small beer.

Several very disgusting remedies were suggested from time to time, an account of which may be found in Egshaw's and the "Gentleman's Magazine" during the time of the murrain, and especially in the sixth vol of the latter.

In the October number of the "Gentleman's Magazine" for 1748, it is stated that treatment by bark and port wine had been tried and had failed, and it is recommended to give instead an ounce of powdered bark with dock leaves in hot water at night. The treatment adopted by Lazard in the last years of the distemper, consisted in separating the diseased beast from all others, in a clean stall, ablu-tions with warm vinegar and water, followed with dry rubbing with straw, together with blood letting, aperients and setons in the early stages, and bark and stimulants in the latter stage of the disease.

One of the pamphlets published on the cattle plague in 1748, is more curious than most of these ephemeral essays on the subject, as it throws some doubt on the identity of the epizootic to which it refers with the recent rinderpest, and approaches more closely to the description of the pathological signs of pleuro-pneumonia. The writer says:—"The blood vessels of the lungs are stuffed up and dis-

tended with grumous or coagulated blood. The lungs were in some of a livid or blackish colour, and putrified to such a degree soon after the cattle were dead, as scarcely to bear touching. Abscesses were found in the lungs of others. . . . and the tonsils were inflamed or im-pothumated." (*Pestilent contagion occasioned by the disease now raging in-cattle by Tater, 1748.*)

In 1750 the cattle plague seems to have assumed a more virulent form, and the Magazines for that year were occupied with discussions on the propriety of the slaughter of infected cattle, and comparatively few remedies were suggested. In November, 1750, one writer says, that he "cured two beasts which were very ill of the distemper by boring a hole in the horns, whence issued a great quantity of matter." But in April 1751, a correspondent of the "Gentleman's Magazine," stated, that this plan of treatment had been tried, and did more harm than good. From 1751 the communications to the magazines on the subject of cattle plague, gradually diminish in number, as the disease declined year by year, until 1755, in which year it is only mentioned once in the "Gentleman's Magazine;" and is not subsequently referred to in any of the periodicals of the time which I have searched.

(To be continued in our next.)

UNFORTUNATE CASE OF POISONING BY A MEDICAL MAN.

AN exceedingly painful case of accidental poisoning occurred at the village of Wardley, near Uppingham, Rutlandshire, on the 9th inst., the victim being the wife of Mr. C. H. Simkin. On the following day an inquest was held on the body before Mr. William Sheild, coroner, when the following facts were adduced in evidence:—Mrs. Simkin (the deceased) had for some time suffered from ill-health, and had been attended by Mr. Spencer, who is an old practitioner residing at Hallaton. On the 31st of August she complained of being unwell, and said she had a pain in her back and shoulders, which she attributed to rheumatism. On a subsequent day she was taken seriously unwell at an archery meeting, and had to be taken home. On that occasion she had a fit, and complained of a pain in her head, which she attributed to neuralgia. From that attack she recovered, and on the Sunday she died she was apparently in excellent health and spirits, but was still taking medicine. In the evening as Mr. Simkin, deceased's husband, was going over to Hallaton to see a brother of his, who was unwell, his wife requested him to call at Mr. Spencer's for some medicine he was to send her. He accordingly did so, and he saw Mr. Spencer, who gave him a bottle of mixture wrapped up in the usual way. He then returned home, which he reached about eight o'clock, and placed the medicine on the table in the hall just as he received it. When he entered the room the deceased asked for the medicine, and, on being told where it was, she fetched it, and tore off the paper the bottle was wrapped in. She then opened the bottle and smelt the contents, but did not take any of it just then. Shortly after nine o'clock the family went up stairs to bed, the deceased taking her medicine with her. She did not go direct to her own bedroom, but went to the bedchamber of Miss Spurgeon, a lady who was staying in the house, where she remained about twenty minutes. On leaving that room to go to her own she inquired for a glass from which to take some of the mixture. It is supposed she then took a dose and got into bed. She had not, however, been long in bed before she awoke her husband, who had fallen asleep before she went to bed, and complained of being unwell, and asked him what time he intended getting up in the morning. She then exclaimed "Oh, I feel so giddy," and commenced shuddering and screaming out. She complained also of pains in her legs, and said, "Don't let my legs go to sleep." Mr. Simkin called to Miss Spurgeon to go to him, and when she got into the room the deceased was quite black in the face and convulsed, the body and legs kept jerking, and her limbs were rigid. The convulsions came on in fits, but she was stiff all the time. They gave deceased some brandy, but she could not take it, her teeth being firmly set. They also rubbed her limbs, and placed her legs in hot water, but she never rallied, and died in about twenty minutes from the time of being first seized. Mr. Spencer was sent for, but before he arrived she was dead. On his being told that Mrs.

Simkin had said she wished she had never taken the medicine, he observed that there could not have been anything in the mixture he had sent her calculated to hurt her. He then took up the bottle and drank some himself. A few minutes after he had drunk it he also became seriously ill, and had a fit of convulsions, twitching of the limbs, and stiffening of the joints. That, however, he attributed to the shock of hearing that Mrs. Simkin had died so suddenly, and said he had been slightly unwell on the road, having vomited. He nearly always, he remarked to Mr. Simkin, felt sick and unwell if he rode directly after dinner. Mr. Simkin, however, appears to have entertained some suspicion that there was something wrong with the medicine, and ordered it to be taken care of. He then sent for Mr. Bell, another medical gentleman, who at once attended Mr. Spencer, and under whose care he gradually recovered. The next day Mr. Simkin sent for Inspector Harrison of Uppingham, and communicated to him what had taken place, and directed him to make inquiry into the circumstances. From what he (the inspector) then learnt he at once communicated with Mr. Sheild, the coroner, and that gentleman directed an inquest to be held, and a post-mortem examination of the body of the deceased lady to be made. The medicine and the viscera were placed in bottles, sealed up, and taken by Mr. Mitchell, the chief constable of Rutlandshire, to London, and delivered over to Professor Taylor.

On Thursday the inquiry was resumed, and the following additional evidence given:—

Mr. Bell, surgeon, proceeded to describe the symptoms he found Mr. Spencer suffering from when called in to attend him. He said—I found him sitting in a easy chair, with his waistcoat and shirt unbuttoned. His pulse was 120 and very weak. His tongue had a brown appearance, and the surface of the body was cold and flabby, and there was a profuse perspiration. He was lying back perfectly helpless, and with his eyes shut. A fire was made up, and he became warmer. His pulse then went down to 112, and became stronger. At about five o'clock he called out to me and Mr. Simkin, and asked us to hold him. He then had convulsions, throwing himself back, and raising himself up. There was great rigidity of the muscles and tetanic convulsions. He also got very black in the face, and had great difficulty in breathing. He likewise had twitching of the arms. That fit lasted about a minute, but he had similar symptoms, more or less severe, from the time I first saw him until I left at a quarter past seven in the morning. He appeared to have a pain in the stomach, and kept drawing himself up. There were frequent involuntary twitchings of the face and hitching of the skin of the stomach and face. He was, however, never unconscious, neither was he sick while I was there, although he complained of feeling sick. When I went to see him again at eleven o'clock he had vomited a little.

Dr. Alfred Taylor said—The large bottle contained $1\frac{1}{2}$ oz. of liquid, including sediment, and the small one $2\frac{1}{2}$ oz., also including sediment, making altogether 4 oz., or one-third of the total capacity of the large bottle, 12 oz. The liquid was separated from the sediment, it tasted very bitter. A chemical analysis showed that the liquid contained in a dissolved form brucia and strychnine in the proportion of 1·7 grain to an ounce, the brucia, from its greater solubility, being in larger proportion. The dry sediment obtained from the large bottle weighed 5·2 grains, and that from the small bottle weighed 3 grains, making 8·2 grains of undissolved matter from the two bottles. This sediment was tested and found to be nearly pure strychnia. A quarter of a grain of the sediment produced tetanic convulsions in a rabbit in thirty minutes, and caused the death of the animal, with the usual symptoms of strychnia poisoning, in ten minutes more. The sediment or undissolved residue from the two bottles was examined for bismuth, but none was found in it. He mentioned that fact because he had seen from the prescription that it was stated to have contained bismuth. The liquid in the bottles contained much brucia, with some strychnia. On evaporation 1·7 grains were obtained from an ounce of it. Hence, in the four ounces there would be 6·8 grains dissolved. Hence, in the two bottles the weight of dry sediment, principally strychnia, was 8·2 grains; the weight of brucia, strychnia, and other soluble matter 6·8 grains; total grains in 4 ounces of mixture, 15 grains. Three tablespoonfuls, the dose marked on the large bottle, are equivalent to nearly two ounces, hence such a mixture would contain in a single dose, if it were shaken, a fatal dose of strychnia. Half a grain of strychnia has

proved sufficient to destroy the life of a human adult in twenty minutes, and in the sediment alone there was enough to kill sixteen persons. The stomach contained three ounces of partly-digested food, in which was starchy matter; the stomach was quite healthy, and its contents presented the appearance usually seen in the bodies of persons who have died suddenly in a state of health, and while digestion was going on. The application of the usual tests and processes to the stomach, duodenum, and œsophagus, as well as to their contents, showed that strychnine was present in a small quantity in each case. The largest proportion was found in the duodenum. Some powdery matter scraped from the surface of the œsophagus was by the usual tests found to be strychnine. Taking these facts and the statements in the depositions—namely, that deceased took a dose of the mixture and died in about half an hour afterwards, I am of opinion that her death was entirely due to strychnine. From the appearances, the symptoms described, and the result of the analysis, I have no doubt whatever that the deceased died from strychnine, and not from natural causes. It is possible that old samples of bismuth might be mistaken for strychnine, as they are very much alike in appearance, but they are very different in their effect. The one is very simple, and the other is a very potent poison. Any human being taking a dose like the one alleged to have been taken by the deceased would certainly die from the effect. Generally, strychnine is only kept in very small quantities, while bismuth is kept in large bottles. All bottles containing drugs ought to be distinctly labelled. An experienced person ought to know the difference between bismuth and strychnine by the weight, the one being much heavier than the other.

Other evidence was adduced to show that there had been no tampering with the medicine after it left Mr. Spencer's surgery, and that the bottle was not opened by any one except the deceased. There can be little doubt from the above evidence that strychnia had been mistaken for bismuth.

The Coroner explained to the jury that the first question they had to consider was, how the deceased came to her death. If by poison, by whom was the poison administered, and whether it was administered by accident or from gross ignorance, or gross neglect. If through either of the latter causes, then the party so administering it would be in law guilty of "Manslaughter."

Mr. Douglas, solicitor, Market Harborough, was present to watch the case on behalf of the deceased's family; and Mr. Brown of Uppingham, on behalf of Mr. Spencer.

The jury, after consulting a short time, returned a verdict that the "deceased died from strychnine, administered by Mr. Spencer with gross neglect."

Upon the delivery of the verdict Chief Constable Mitchell, who had been present during the proceedings, took Mr. Spencer into custody on the charge of manslaughter. He was shortly afterwards admitted to bail, himself in £500 and two sureties in £250 each. The case will be tried at the next assizes.

CHORLTON UNION HOSPITAL.

ON Friday last the opening of this important building was celebrated by a dinner at which a number of the visitors to Manchester for the Social Science Congress were present.

The exposures which have recently been made in connexion with Union hospitals in London gave more than ordinary interest to this event. Arrangements were made for visits of members of the Congress, which gave them every opportunity of inspecting this new hospital. It is so much in advance of all other establishments of the kind in this country, that when the proposition for it was first laid before the Poor-law Board in London, they were almost astounded at the dimensions it was likely to assume, and the liberality which dictated a scheme so much in advance of anything heretofore attempted. Not many years ago the townships in the Chorlton Union were of a semi-rural character, but with a sparse and scattered population; but the removal of dwellings in Manchester to make room for warehouses and places of business, simultaneously with a rapid growth of trade, has caused such a resort of the population to dwellings in that direction that the number of inhabitants in the Union is estimated at near 200,000. Unfortunately, pauperism has kept equal progress with population, and hence the necessity for extensive workhouse and hospital accommodation. The hospital is built at the back of the workhouse, and separate

from it. It consists of five long pavilions parallel to each other, but separated by spaces of garden ground, 100 feet each in width. Each pavilion is three stories in height, and has three wards, each containing 32 beds; so that in the hospital altogether there are 480 beds for the accommodation of the sick poor. The bedrooms are 15 ft. high. They have each a fireplace and grate, and the pavilions are lighted by eight windows in a line on each side, so that there is thorough light and ventilation; there are 15 baths in each, supplied with hot and cold water. Each ward has a small kitchen and nurse's room at one end, and other conveniences. The five pavilions are connected at the ends towards the workhouse by a wide and lofty corridor of immense length. A second corridor strikes at right angles from the middle of the other, and connects the hospital with an immense general kitchen, and through that with the workhouse. The windows of the hospital look out upon a fine open country, the prospect extending into Cheshire, the boundary of that country being within a very short distance. The cost to the Union has been about £24,000, but the contract for the building was only £17,000.

THE CALENDAR OF THE ROYAL COLLEGE OF SURGEONS IN LONDON.

THE Council of the Royal College of Surgeons of England has just published for a second year a calendar of their Institution on the same plan as those emanating from our Universities, and we think they deserve great credit for the manner in which it is produced, entailing, as appears from the profit and loss account of the last issue, a deficiency of £139 8s. 11d., the receipts amounting to only £8 18s. 4d.; then the charge to members was five shillings, but now the charge has been reduced just one-half, at which price the book may no doubt pay its expenses. From the report of the Council, it appears that the receipts and expenditure of the College in the year from Midsummer-day, 1865, to Midsummer-day, 1866, amounted respectively to £10,993 7s. 7d. and £12,641 1s. 4d., showing an excess of expenditure over the receipts of £1647 13s. 9d. The income of the College is derived principally from the fees paid on admission to the Membership, which amounted during the past year to the sum of £8197 15s. The Fellowship examinations produced £210. The Midwifery and Dental Diplomas yielded £134 8s. The election of old members into the Fellowship is still remunerative, having produced £189. The judicious investment of some of the College capital in the purchase of freehold property is shown in the return of £809 18s. 9d. for rent, to which there will be some addition next year. The College does not appear to possess much funded property, as the dividends on investments in Government securities only produced £1233 17s. In the disbursements, which amounted to £12,641 1s. 4d., it appears that the largest item is in fees to Council and Examiners, which is put down at £3610 5s. 6d. The salaries and wages appear next in numerical amount as £3101 14s. 10d. The Government and parochial authorities are large recipients of the College cash, as upwards of *eleven hundred pounds* was paid in the year for diploma stamps, taxes, and rates. The pensions appear to be on the increase, as £498 12s. is put down against £307 13s. of last year. Nearly £200 has been distributed by the Council in prizes and lectures for the members of the College. And during the present and following year £136 10s. is offered for essays, on given subjects, for competition among the members. During the past collegiate year great changes have taken place in the institution. Mr. Luke, a twice-elected president, has been displaced from the Council in favour of Mr. Charles Hawkins, the Government Inspector of Anatomy; Mr. Joseph Hodgson resigned his seat in the Court of Examiners, and Mr. Richard Quain was elected in the vacancy, and became a vice-president of the College. In the Midwifery Board Drs. Barnes and Priestley have displaced Drs. Oldham and Lee; in the Dental Board Mr. W. A. Harrison has been elected in the vacancy occasioned by the retirement of Mr. Thomas Bell; and the examiners in classics, mathematics, and French for the Fellowship

disappear altogether, this duty having devolved on the Royal College of Preceptors. The Council, the governing body of the College, have had 13 meetings during the year; the Court of Examiners has had 54 meetings, and examined 20 candidates for the Fellowship, rejecting only one; for the primary or anatomical and physiological examination for the diploma of membership 497 candidates were examined, and 136 referred back to their studies for three months; for the pass or pathological and surgical examination 410 were examined, and 64 referred for six months. And during the year 18 assistant-surgeons presented themselves for examination for promotion to the rank of naval surgeon, all of whom were reported to the Admiralty as having passed to the satisfaction of the Court. The Board of Examiners in Midwifery have had four meetings and examined 43 candidates and rejected 7. The Board of Examiners in Dental Surgery have only examined and passed 2 candidates during the year. With regard to the Fellowship it appears that only 7 have passed the preliminary examination, making a total of 123 who have passed since its institution. Of the number of fellows now on the list, it appears that there are 324 gentlemen who have obtained this honourable distinction after the severe examinations prescribed by the authorities, 245 honorary and 745 by election, making a total of 1314, to whom the elections into the Council are confided.

THE QUEEN'S UNIVERSITY IN IRELAND, DUBLIN CASTLE.

OPERATIVE SURGERY.

Examiner—ROBERT McDONNELL, M.D., F.R.S., F.R.C.S.I.
THE candidates were directed to attend for examination in the dissecting-room of the Carmichael School of Medicine. Instruments, splints, and surgical appliances in great variety were supplied by Messrs. Thompson and O'Neill.

One of each of the following was assigned by lot to each candidate:—

I. SURGICAL INSTRUMENTS AND APPLIANCES.

1. Select and arrange on a tray such instruments as you would require in order to perform the lateral operation for lithotomy on a boy, say twelve years old.
2. Apply a "spica bandage" with compress.
3. Strap the testis.
4. Apply one of those trusses as you would in a case of double femoral hernia, selecting one of a size suitable to fit a patient of the same dimensions as the subject.
5. Arrange on a tray the instruments necessary for excision of the knee-joint.
6. Select from among the instruments before you a laryngoscope, and show the mode of using it.
7. Show on the subject the mode of putting up a fracture of the humerus, say through the surgical neck.
8. Show on the subject the mode of putting up a fracture of both bones of the leg a little above the ankle-joint.
9. Select an écraseur from among instruments before you, and show the mode of using it.
10. Prepare a many-tailed bandage, and apply it on the lower limb of the subject.
11. Select and arrange in the order in which they would be required the instruments ordinarily used in the extraction of a cataract.
12. Show on the subject the mode in which you would adjust the limb of a patient whose tendo-Achillis was ruptured.
13. Put up the fracture known as "Potts' fracture."
14. Select from among the instruments before you an ophthalmoscope and show the mode of its application.

II. MINOR OPERATIONS.

1. Amputate the unguis phalanx of the index finger.
2. Show the mode of using the stomach pump.
3. Divide subcutaneously the tendo-Achillis.
4. Amputate the fore-finger at the metacarpal phalangeal articulation.
5. Perform venesection.
6. Perform circumcision.
7. Show the mode of performing paracentesis of the chest.
8. Insert a "quill suture."

9. Operate on the portion of the lip of the subject as if the part marked were affected with epithelial cancer.
10. Amputate the great toe.
11. Amputate the penis, adjusting the orifice of the urethra so as to lessen the risk of stricture.
12. Show the mode of applying acupressure on an artery, say the radial.
13. Amputate little toe and its metacarpal bone.
14. Perform the operation of revulsion of the nail.
15. Insert an Anel's probe into the lacrymal puncture.

III. CAPITAL OPERATIONS.

1. Amputate below the knee.
2. Perform the operation known as "Hey's operation" on the foot.
3. Excise the head of the humerus.
4. Apply a ligature on the external iliac artery.
5. Amputate about the middle of the forearm.
6. Apply a ligature on the brachial artery about the middle of the arm.
7. Apply a ligature on the common carotid artery.
8. Excise the elbow-joint.
9. Amputate at the middle of the thigh.
10. Apply a ligature on the subclavian artery in its third stage.
11. Amputate through the shoulder-joint.
12. Perform the operation known as "Symes' operation" at the ankle-joint.
13. Apply a ligature on the femoral artery in Hunter's canal.
14. Perform tracheotomy.
15. Extirpate the eyeball.
16. Trepaine the skull.
17. Amputate at the middle of the leg.

SURGERY.

Examiners—ROBERT McDONNELL, M.D., F.R.S., F.R.C.S.I.

1. Write a short essay on the form of cancer known as epithelial cancer, or epithelioma.
2. Describe the affection known as "erectile or vascular tumour;" mention the other names given to growths of this kind, and the modes of treatment which have been suggested.
3. Describe the pathological changes which chronic rheumatic arthritis gives rise to in the shoulder joint.
4. Describe the methods by which the healing of divided nerves may be accomplished.
5. Enumerate the symptoms and describe the progress and treatment of a case of chronic osteitis—say of the tibia.
6. What are the directions given in the Pharmacopœia for making a hemlock poultice; and for what case is such a cataplasm suitable.
7. Describe the disease known as "housemaid's knee," and enumerate the modes of treatment suggested for it.
8. A patient labouring under acute gonorrhœa is attacked with retention of urine; what will you do for him?
9. What are the diagnostic symptoms by which a hydrocele of the tunica vaginalis may be distinguished from a scrotal hernia?
10. Suppose that you have to deal with a case of simple fracture of the femur in a young person, and about the middle of the bone, describe how you will treat the case.
11. What are the early symptoms of caries of the spine in the dorsal region? What the treatment?
12. What are the directions given in the Pharmacopœia for making a cathartic and turpentine enema?

BOTANY.—PROFESSOR MELVILLE, M.D.

1. Describe in technical terms the plants 1, 2.
 2. Describe the reproductive organs and mode of development of the Lycopodiaceæ.
- PROFESSOR GREENE, B.A.
3. Define Umbelliferae. Name any other British plants having their flowers disposed in umbels.
 4. Explain, with the aid of diagrams, the terms (a) valvate, (b) imbricate, and (c) contorted, as applied to the calyx and corolla.

PROFESSOR WYVILLE THOMSON, LL.D.

5. Give the characters of the Salanaceæ, and state the properties of any economic or medicinal plants belonging to the order.
6. Describe the reproductive organs in Ferns, and the mode of reproduction and development in the group.

PHYSIOLOGY.—PROFESSOR CORBETT, M.D.

1. Describe minutely the structure of simple mucous

membrane; then give a brief account of the extent and office of the gastro-pulmonary and genito-urinary mucous membranes.

2. Describe Volkmann's Hæmodromometer and the mode of applying it.

PROFESSOR REDFERN, M.D.

2. What conditions are essential for active gastric digestion? Describe in detail how you would secure the artificial digestion of flesh in an experiment. What evidence is there that digestion of albuminous matters can take place in the small and large intestines?

4. State from what sources the chloride of sodium, the sulphates, and the phosphates of the urinary secretion are derived, and how this is ascertained.

PROFESSOR CLELAND, M.D.

5. Describe the anatomical and physiological peculiarities of the yellow spot of Sommering, as compared with the rest of the retina.

6. Describe the history of the allantois, and formation of the urinary bladder.

CHEMISTRY.—PROFESSOR ANDREWS.

1. What are the tests for lime and magnesia, and how would you apply them to the analysis of a fusible calculus?

2. State in symbols the reactions that occur in the preparation of sulphuretted hydrogen from sulphide of iron, and also from sulphide of antimony; state also the composition by weight and by volume of this gas, and how it may be analysed.

3. What is the average composition of expired air, and how would you analyse it?

4. Give an account of the acetic acid fermentation, and of the chemical changes which accompany it?

PROFESSOR BLYTH.

5. How would you ascertain the neutrality of the salt of a bibasic acid? Give examples by formulæ of neutral and basic salts of a bibasic acid.

6. How is arsenuretted hydrogen prepared? How would you distinguish it from the corresponding compound of antimony?

7. What are the chief sources of bromine? Give the mode of preparing it, its properties and the compounds it forms with oxygen and with hydrogen.

8. By what means is albumen in urine detected. What precautions in some cases are necessary for success in detecting it?

PROFESSOR ROWNY.

9. Give the method of preparing calomel; state its composition and properties.

10. State the laws of combination by weight and volume.

11. What is meant by isomorphism? Give some examples of isomorphous bodies.

12. Mention the principal sources from whence chloride of sodium is obtained, and state the uses to which this salt is applied.

ZOOLOGY.—PROF. MELVILLE, M.D.

Vertebrata.

1. Give a description of the reproductive system of the Kangaroo.

2. Describe the peculiarities of the skeleton in the Plagiostomi.

Invertebrata.

3. Give a sketch of the morphology of the Hydrozoa.

4. Describe the structure of the organs of circulation and respiration in the Crustacea.

PROF. GREENE, B.A.

Vertebrata.

5. What families of hoofed quadrupeds occur on the American continent? Mention any facts touching their distribution elsewhere which may seem particularly worthy of notice.

6. Define the Crocodilia, distinguishing this group from the true Lizards.

Invertebrata.

7. Explain the growth of the shell in the spiral Gastropods, and show how far, when injured, reparation of its substance may take place.

8. How, irrespective of the greater number of their paired appendages, do Myriapoda differ from true Insects and Arachnida?

PROF. WYVILLE THOMSON, L.L.D.

Vertebrata.

9. Describe the eye of an Owl.

10. Describe the peculiarities of the skeleton of the Duck-mole (*Ornithorhynchus*).

Invertebrata.

11. Name and refer to their positions in the zoological series, some of the principal human internal parasites.

12. Describe the mechanism of respiration in *Echinus*.

SUPPLEMENTAL CHARTER TO THE QUEEN'S UNIVERSITY.

MEETING OF THE SENATE.

At two o'clock on Saturday the Senate of the Queen's University met at the Castle, for the purpose of discussing the propriety of accepting the Supplemental Charter which had been granted to the University by the late Government. The members present were:—The Right Hon. the Earl of Rosse, Chancellor of the University of Dublin; the Right Hon. Francis Blackburn, Lord Chancellor of Ireland and Vice-Chancellor of the University of Dublin; the Right Hon. Maziere Brady, ex-Lord Chancellor of Ireland and Vice-Chancellor of the Queen's University; the Chief Baron of the Court of Exchequer; the Chief Justice of the Court of Common Pleas; the Rev. P. Shuldham Henry, D.D., President of the Queen's College, Belfast; Sir Robert Kane, F.R.S., President, Queen's College, Cork; Edward Berwick, Esq., B.A., President, Queen's College, Galway; Sir D. J. Corrigan, Bart., M.D.; Major-General Sir Thomas A. Larcom, Under-Secretary: James Gibson, Esq., M.A., Barrister-at-law; Robert Adams, Esq., M.D.; Sir Robert Peel, late Chief Secretary for Ireland; Right Rev. Dr. Fitzgerald, Lord Bishop of Killaloe; the Earl of Dunraven; Lord Clermont; Lord Talbot de Malahide; the Right Hon. William Monsell, M.P.; Mr. Justice O'Hagan, and Professor Sullivan. The Secretary, G. Johnstone Stoney, Esq., M.A., was also in attendance. The meeting was strictly private, but the result of the deliberations of the Senate, which continued upwards of three hours was, we understand, that they accepted the Supplemental Charter by a majority of eleven to nine.

The following is the result of the division:—

For the acceptance of the Charter—The Right Hon. Maziere Brady, Chief Justice Monahan, Lord Chief Baron, Right Hon. Mr. Justice O'Hagan, Lord Talbot de Malahide, Lord Dunraven, Lord Clermont, Right Hon. W. Monsell, M.P.; Sir D. J. Corrigan, Professor Sullivan, and James Gibson, Bart.—eleven.

Against—Right Hon. the Earl of Rosse, Right Hon. the Lord Chancellor, Rev. Shuldham Henry, Sir Robert Kane, Sir Robert Peel, Lord Bishop of Killaloe, Thomas A. Shillington, Robert Adams, M.D.; and Edward Berwick, Esq.—nine.

CURIOSITIES OF MEDICAL LITERATURE.

EDITORIAL AMENITIES.—The *Medical Mirror* publishes the following thunderbolt from the pen of a Fenian doctor. We presume our editorial *confrère* has placed himself under the wing of the "Saxon" police, or made his arrangements for a Continental tour. The Brazilian packet is overdue:—

TO THE EDITOR OF THE MEDICAL MIRROR.

Campinos, Provincia de San Paulo, Brazil.

SIR,—Thinking from an advertisement I saw, that the *Medical Mirror* might give some insight as to medical opinion in England, which a physician in any country cannot wholly ignore, I ordered it from my bookseller in Rio de Janeiro, and lately received the Nos. of January, February, and March of this year. Now, at page 156 (March No.), I see that with a daring any coward who has a secure hiding-place may show, you insult the Irish prisoners (political) of the English tyrant, daring to recommend the application to them of ignominious corporal torture. Now, as I cannot get hold of you to order two or three Capangas to give you the sound cow-hiding you deserve for your insolence, I will at least beg you to consider yourself morally insulted by me in any and the grossest way you can imagine. Your stupidity doubtless renders you ignorant of the rights of Irishmen; and you probably think that Ireland is part of England, as Sussex or Kent. God made Ireland a free and independ-

dent country! Man's wickedness has made Ireland England's slave. It is proper to Saxon brutality to insult and gibe and sneer at a crushed slave. Morally, these victims of English brute force whom you cowardly insult are infinitely superior to their English tyrants, and in God's own time their wrongs will be avenged.

Wishing you as much civilization and moral and Christian feeling as a Protestant Saxon can acquire, I am, Sir, your obedient servant,

RICHARD GUMBLETON DAUNT, M.D., Edin.,
Norman Irish Noble and Brazilian Citizen.

16th August, 1866.

THE CHANGE OF TYPE QUESTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—If Dr. Henry Kennedy will refer to the article on "Change of Type," and to my former letter, he will see that no gauntlet was thrown down by me, but that, being simply astounded at the misstatements of the facts of medical history, I demanded an explanation, for which I still wait.

The question of change of type can never be obsolete or a thing of the past so long as its weakest side has so distinguished a supporter as Dr. Kennedy; still, if he will only bring forward a few facts in favour of his views, it will certainly be a most interesting novelty in the controversy, and I shall have no objection in that case to tell him what I think of them, and to sign my own name instead of as at present,

A DISBELIEVER IN CHANGE OF TYPE.

COUNTY COURT, NEWCASTLE-ON-TYNE.

A SCOTT GELL v. WM. HINDMARSH.

MR. STEAVENSON for plaintiff, and Mr. Robinson for defendant. Plaintiff, who is a surgeon at Ayeliff, sued the defendant, a labourer at the same place, for £3 8s. 6d., the amount of account for attendance upon, and medicine supplied to, defendant and his wife. Mr. Steavenson contended that as plaintiff was only a surgeon, and not an apothecary, he could not recover for either attendance or medicine. Defendant's wife had been suffering from inflammation of the bowels, and, in answer to his Honour, plaintiff said he had had to apply mustard and other blisters, which he considered part of his surgical duties.

His Honour thought that it was rather a strange doctrine, that if a surgeon performed an operation and gave medicine in order bring his patient into a proper state, he was not to be allowed to recover for it.

Mr. Steavenson submitted that there were three distinct branches of the profession—a physician, a surgeon, and an apothecary—and if a surgeon practise medicine without being an apothecary, then he is not entitled to recover for it. If a surgeon was allowed to practise medicine, and recover for it, then what was the use of becoming a licentiate of the Apothecaries' Hall?

His Honour: If a gentleman is registered as a surgeon, and medical science is incidental to the application of his surgical duty, he is entitled as incidental, and as part of his claim to recover.

Evidence was given on the part of defendant that plaintiff had refused to attend his wife when requested, had gone to the house at eleven o'clock instead of six one evening, and had ultimately refused to attend at all, in consequence, as he stated, of defendant's family being insolent to him.

His Honour considered that after a doctor had undertaken a case he was compelled to attend it until he effected a cure or was dismissed by the person requiring him, or give up the case on some reasonable grounds. He considered that by neglecting his patient the plaintiff had forfeited his right to any claim for attendance, for it was of the utmost importance that medical gentlemen should understand their responsibility.

The judgment would, therefore, be for defendant.

THE now annual St. Bartholomew dinner took place on Monday last at the Albion Tavern, immediately after the brilliant address delivered by Mr. Savory to inaugurate the opening of the session. The number present at this entertainment was unusually large, and under the very able presidency of Dr. Jeaffreson the success of the evening was unequivocal. The treasurer, the chaplain, and most of the Medical staff were present.

Notices to Correspondents.

A.B.—The length of time necessary for a woman to attend the Rotunda Hospital, in order to obtain the Diploma of Midwife, is six months; the fee is, for an intern, £20, for which she is boarded, and an extern pays £10.

M. J. B.—The notice is inserted.

R. A.—The subject shall receive attention.

X. Y., Liverpool.—The case is not related with sufficient clearness to enable us to give a decided opinion.

Communications, &c., received from—Dr. Ogle, Dr. Fincham, Mr. Hulke, the Pathological Society, &c. &c.

Appointments.

LONDON.

HOWELLS, T., M.B., C.M., M.R.C.S.E., has been appointed House-Surgeon to the Westminster General Dispensary, Gerrard-street, Soho, vice P. J. Simpson, M.R.C.S.E., appointed Apothecary to the Middlesex County Lunatic Asylum, Colney-hatch.

PROVINCIAL.

BROUGHTON, H. T., M.R.C.S.E., has been appointed Resident Medical Officer to the Infirmary and Dispensary, Bradford, Yorkshire.

EVANS, O., M.R.C.S.E., has been appointed House-Surgeon to the Royal Berkshire Hospital, Reading.

MERCER, N. G., M.D., has been appointed a Junior Medical Officer of the Lancaster County Lunatic Asylum.

BIRCH, J. P., M.R.C.S.E., has been appointed Medical Officer for the Tallylyn District of the Dolgelly Union.

COOKSON, A. N., M.R.C.S.E., has been appointed Assistant-Surgeon to the Stockport Infirmary, vice Carter, resigned.

DOUGLAS, G. C., M.R.C.S.E., has been appointed Medical Officer for District No. 3 of the Brackley Union, Northamptonshire, vice G. A. Knott, M.R.C.S.E., resigned.

DUKE, R., M.R.C.S.E., has been appointed Medical Officer for District No. 7 of the Battle Union, Sussex, vice H. B. Smith, M.R.C.S.E., resigned.

GAFFRITH, M.R.C.S.E., has been appointed Medical Officer for the Mallwyd District of the Dolgelly Union.

LOCKING, M.R.C.S.E., has been appointed Certifying Factory Surgeon, Hull, vice R. Hardy, M.R.C.S.E., deceased.

MCCLURE, A. A., L.R.C.P.Ed., has been appointed Medical Officer for the Tottington No. 2 District of the Bolton Union Lancashire, vice J. Carruthers, M.D., resigned.

Medical News.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—At a general meeting of the Fellows held on Tuesday, Oct. 2nd, the following Members of the College were duly admitted Fellows of the same:—

Hicks, John Braxton, M.D. Lond., St. Thomas's-street.
Latham, Peter Wallwork, M.D. Cantab, Cambridge.

At the same meeting, the following gentlemen, having undergone the necessary examination, were duly admitted Members of the College:—

Beigel, Hermann, M.D. Berlin, Finsbury-square.
Lomas, William, M.D. St. Andrews, Harley-street.
Waring, Edward John, M.D. St. Andrews, Talbot-villas, Westbourne-park.

The following Extra-Licentiate was also admitted a Member of the College:—

Forbes, John, Addison-road, Kensington.

THE FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.—At a meeting of this Corporation, held on the 1st inst., the following office-bearers were elected for the ensuing year, viz.:—

John Gibson Fleming, M.D., *President*.
Andrew Anderson, M.D., *Visitor*.
John Coates, M.D., *Treasurer*.
George Rainy, M.D., *Honorary Librarian*.
James Dunlop, M.D., *Vaccinator*.

COUNCILLORS.

The President, *ex-officio*.
The Visitor, *ex-officio*.
Wm. Weir, M.D.

BOARD OF EXAMINERS.

James Adams, M.D.
George Buchanan, M.D.
Andrew Anderson, M.D.
Thomas Watson, M.D.
William Lyon, M.D.

EXAMINERS IN ARTS.

Professor Ramsay.
L. Hill, LL.D., and William H. Hill, *Clerks*.
Alexander Duncan, B.A., *Librarian and Secretary*.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise on September 27th:—

Baker, Benjamin, Framlingham, Suffolk.
Beckett, Francis Mears, Hitchin, Herts.
Davidson, Thomas, Forres, Morayshire, N.B.

The following gentlemen also on the same day passed their first examination:—

James Howard, Manchester School of Medicine; Frederic Rainbow, St. Thomas's Hospital; Geo. Arthur Woods, Liverpool Royal Infirmary.

MEDICAL CLUB.—A preliminary meeting of the members of the above club was held at the house of Mr. Propert, New Cavendish-street, on Tuesday, October 2nd. Present.—Mr. Propert in the chair; Dr. Butler, Woolwich, Mr. Laurence, Dr. Wilson, Iles Watford, Dr. Chavallier, Ipswich; Mr. Read, Dr. McEwen, Chester; Dr. Webster, Northampton; Mr. Whitfield, Kensington; Dr. Weber, and Dr. Lory Marsh; several gentlemen left before the meeting was concluded whose names did not transpire. A considerable increase in the number of members was announced and a satisfactory report of the progress of the club since the previous meeting was presented. A copy of the proposed rules was read, and considerable discussion ensued, especially with reference to the future designation of the club. It was ultimately decided to adhere to the title "Medical Club," until the general meeting at which it would be competent to substitute any other that might be then agreed upon. Amongst the names suggested were the following:—The Brodie, the Sydenham, the Hunterian, and the Harveian. A letter was read from Sir Wm. Fergusson, expressing his pleasure to preside at a general meeting to be held in the Hanover-square Rooms on Thursday, November 8th, at two p.m., to take into consideration the best means to adopt to secure the successful carrying out of the club.

NEW FORM OF SWINDLE.—A man named John Jackson has been brought before the magistrates at Bradford on a charge of falsely representing himself to be a sanitary inspector, and in that character levying black mail from various householders. He was committed to take his trial for fraud.

On Monday week an Act of Parliament came into force for the better prevention of disease at military and naval stations. Hospitals are to be provided, and visiting surgeons appointed. The expenses to be defrayed by Parliament.

The return of the state of pauperism for London shows an increase of 14 per cent., the number being somewhat over 90,000 in July, 1865, but 103,000 in July, 1866.

CHARCOAL PEGS FOR ACTUAL CAUTERY.—These are lighted and burn like a cigar, the end being somewhat pointed. They should be applied in a direct horizontal line, because pressure sideways would break the point. The composition is as follows:—Powdered charcoal, 300 grains; nitrate of potash, 22 grains; gum tragacanth, 75 grains; water, 360 grains. Mix into a mass, and roll it into the shape of ordinary lead-pencil, about three inches long. Very few ashes are yielded, and when any form, they may be blown away, the current of air thus keeping up combustion.

A QUARANTINE of fifteen days has been imposed upon all vessels arriving at Malta from Dublin, and of ten days upon those from Tunis.

THE WATER SUPPLY OF THE EAST-END OF LONDON.—We are glad to see that the authorities of Bethnal-green and Whitechapel are bestirring themselves for the purpose of obtaining from the East London Company a purer and better supply of water. A meeting was held on Thursday, September 27, at Bethnal-green; the chair was taken by the rector of the parish, the Rev. S. Hansard. Resolutions were proposed and seconded by Drs. Burgess, Sarvis, Liddle, and Ma. Gladding. An East London Water Supply Association was inaugurated, which is to act in concert with the Mesropolitan Association, whose object is to compel water companies to furnish a constant instead of intermitting supply of water, and to provide an improved system of filtration.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS—LONDON.

HARE.—On the 19th inst., at Brook-street, Hanover-square, the wife of C. J. Hare, M.D., of a daughter.
SHEWAN.—On the 24th inst., at Kensington-gardens-square, the wife of A. Shewan, Esq., Deputy Inspector-General of Hospitals, of a daughter.
USSHER.—On the 24th inst., at Craven-terrace, East-hill, Wandsworth, the wife of Henry Usher, M.B., of a son.
JONES.—On the 17th inst., at Clapham-rise, the wife of S. Jones, M.B., F.R.C.S.E., of St. Thomas's-street, of a son.
PLAYFAIR.—On the 18th inst., at Scarborough, the wife of Dr. W. S. Playfair, of Curzon-street, May-fair, prematurely, of a son.
MAY.—On the 18th inst., at Fletcher House, Tottenham, the wife of Emanuel May, M.R.C.S.E., of a daughter.
LINDSAY.—On the 19th inst., at Hanwell, the wife of J. Murray Lindsay M.D., of a son.
BRAND.—On September 30, at Thicket-road, Penge, the wife of S. C. Brand, M.R.C.S.E., of a son.
EDMONDS.—On September 26, at 27, St. Augustine's-road, Camden Town, the wife of H. Edmonds, M.D., Staff-Surgeon R.N., of a daughter.
EDMONDS.—On September 26, at 4, Fitzroy-square, the wife of James Edmonds, M.D., of a son.
HARLEY.—On the 22nd ult., at Upper Berkeley-street, Portman-square, the wife of John Harley, M.D., of a daughter.
MOSELEY.—On October 1, at 11, Upper Wesbourne-terrace, Hyde-park, the wife of B. E. Moseley, of a son.

PROVINCIAL.

ASHBY.—On September 30, at Lutterworth, the wife of J. F. Ashby, M.R.C.S.E., of a daughter.
BLAKE.—On September 28, at Pevensey, the wife of E. H. Blake, M.D., of a daughter.
FITZGERALD.—On September 26, at Folkestone, the wife of E. C. Fitzgerald, M.D., of a son.
HAMMOND.—On September 28, at Ipswich, the wife of C. W. Hammond, M.D., of a son.
HOWELL.—On September 24, at Blackmeadows, Llantillio, Cressenny, Abergavenny, the wife of J. M. Howell, M.R.C.S.E., of a son.
MARTIN.—On September 27, at Victoria House, Weston-super-Mare, the wife of E. Martin, M.R.C.S.E., of a son.
BANKS.—On the 17th ult., at Riseley, Higham Ferrers, the wife of P. H. Banks, M.R.C.S., &c., of a daughter.

IRELAND.

GLEESON.—September 28, at Hill House, Athlone, the wife of Edward M. Gleeson, Esq., of M.B.Lond., of a son.
FAIR.—October 5th, at Ardvarna, Oughterard, county Galway, the wife of Campbell Fair, Esq., M.R.C.S.E., L.K.Q.C.P., of a son.
HADDEN.—October 6, at Clonakilly, the wife of Henry R. Hadden, M.D., F.R.C.S.I., of a daughter.

MARRIAGES—LONDON.

SHUTTLEWORTH-SMITH.—On September 27, at St. Stephen's Church, Bayswater, R. Shuttleworth, M.R.C.S.E., of Kensal-green, to Louisa Birtha Moyle, youngest daughter of the late J. W. Smith, Esq., Surgeon, of Finsbury-square.
JOHNSON-SANDILANDS.—On October 3, at St. George's, Hanover-square, E. Johnson, L.R.C.P. and L.R.C.S. Edin., to Anna Letitia, second daughter of Mrs. Sandilands, of 56, Belsize-park, Hampstead.

PROVINCIAL.

GOODWIN-SMITH.—On October 1, at St. George's Church, Llandudno, R. D. Goodwin of Ashbourne, Derbyshire, Staff-Surgeon 2nd Administrative Battalion D. R. V., to Elizabeth, second daughter of the late Rev. B. Smith of Drax, Yorkshire.
MAXWELL-HODGSON.—On September 27, at St. George's Church, Worcester, C. R. Maxwell, M.D., of Springfield Lodge, Britannia-square, to Jane, eldest daughter of the late Joseph Hodgson, Esq., of Spital-square, London.
RYLEY-GWENNAP.—On September 27, at the parish church of Alveley, J. B. Ryley, M.R.C.S.E., to Sarah Louisa, only child of the late T. Gwennap, Esq., of London.
WHITE-POWELL.—On October 6, Frederick Augustus White, Esq., S.I. Constabulary, youngest son of the late Matthew Esmonde White, Esq., M.D., county Wicklow, to Annie Winston, eldest daughter of Abraham Powell, Esq., county Sligo.

SCOTLAND.

ORPHOOT-HENDERSON.—On September 27, at St. Paul's, Newton Abbott, P. Orphoot, M.D., of Edinburgh, to Mary Juliana, youngest daughter of the late Rear-Admiral T. Henderson, of Bellevue Dawlish.

DEATHS—PROVINCIAL.

HARRIS.—On the 22nd July, at Sydney, Samuel Harris, Surgeon, aged 52, formerly of Fenchurch-street, city, and eldest surviving son of Charles Harris, Esq., of Lansdowne-place, Brighton.
FORDE, F. P., M.R.C.S.E., of Hemingborough, Yorkshire, on September 15, aged 45.
MORLEY, THOMAS, L.R.C.P. Edin., of Oldham, on September 20.
PETCH, E., L.S.A., of Alma-square, Scarborough, on September 16, aged 65.
ATKINSON.—On the 25th ult., at South View, Hounslow, A. R. Atkinson, M.D., late of the Bengal Medical Service, aged 43.
HARRISON.—On the 25th ult., at Cheltenham, T. D. Harrison, Esq., late of the Madras Medical Service.
FRING.—On the 28th ult., F. B. Fring, M.R.C.S.E., of Grassington, Yorkshire, aged 54.

SCOTLAND.

WALKER.—On the 28th ult., G. Walker, M.D., of Bonnington-place, Edinburgh.

IRELAND.

POWELL.—On the 27th ult., at Cork, Thos. Powell, L.R.C.S.I., of Enniskeen, county Cork, aged 81.
HALLIDAY, J., M.D. Glas., of Belfast, on the 11th inst.
HARPER, JOHN, M.D., Surgeon 35th Reg. N.I., at Lullutpore, India, on August 5, aged 41.
LEET, JOHN KNOX, M.D. Dublin (Surgeon Cape Mounted Riflemen), at Wellington-road, Dublin, on September 19.

BOOKS RECEIVED.

The Harveian Oration for 1866.
 Osteology for Students. By A. T. Norton.
 Cancer: A New Method of Treatment. By W. H. Broadbent, M.D. London: John Churchill and Sons.
 Army Medical Department, Statistical, Sanitary, and Medical Reports. Volume VI. London: Her Majesty's Stationary Office.
 Sanitary Measures and their Results. By Thomas Shapten, M.D. Exeter: Wm. Clifford, High-street.
 Messrs. Churchill and Sons Red Letter List.
 Clinical Lectures and Reports, The London Hospital, vol. iii. London: John Churchill and Sons.
 Guy's Hospital Reports, vol. xiii. London: John Churchill and Sons.
 St. Bartholomew's Hospital Reports, vol. ii. London: Longmans, Green, and Co.

"SALUS POPULI SUPREMA LEX."

OPENING OF THE ENGLISH
MEDICAL SCHOOLS.

INTRODUCTORY LECTURE,

DELIVERED AT

ST. GEORGE'S HOSPITAL.

By Dr. J. W. OGLE.

(Continued from page 354.)

EMPIRICISM has been characterised as "causation inferred from casual conjunction, without any presumption arising from known properties of the supposed agent;" and it cannot be gainsayed, that a very large proportion of our usage of medicines has resulted from intelligent observation of their action on the human body, purposely contrived, but entirely apart, from their previously known properties. Of the exact action, or mode of action, of very many remedies, we have no certain knowledge, and even when we have such knowledge, the action which we intend is not necessarily and invariably warranted by the phenomena of the diseased condition which we seek to subvert; and you may find two physicians taking the same view of the character and origin of a given case, their diagnosis being correct and identical, not only counselling the use of different remedies or different quantities of the same remedy with similar intention, but also recommending treatment with different intentions. To quote one instance from hygienic medicine at the present moment we have one set of what may be termed experts recommending the chlorides as the best possible disinfectant, whilst by another they are considered a delusion and a snare. In fact, if Galen were now living, he would no doubt issue a new edition of his now lost book, "De empiricarum contradictis." Our modern method of practice is essentially eclectic, and whilst in former times one or other system, empiric, dogmatic, and methodistic, or their modifications, have prevailed. We cannot be said to enjoy any positive system at all. Our mode of procedure is founded on the disintegration of former arrangements of thought and the wreck of old-world systems, just as, by way of illustration, our present English history or language are made up of elements from the Saxon, the Danish, the Norman, &c.; or as many of our ancient cities and churches were constructed of the *débris* of material still more ancient and belonging to worn-out types.

"Opinion in good men," has been well said to be "but knowledge in the making." As respects our practice, we are assuredly in the opinionative and by no means certain or positive stage. We neither consider nor act on the principle that most diseases arise from inflammation (whatever that really is) of the stomach and consequently apply leeches to the epigastrium, nor when we have puerperal fever or plenritis or another it is to deal with, do we of necessity, swayed by the humoralist theories of Galen, take blood, vampire-like, from the arm "pleno rivo, ad deliquium animi;" nor inundate the body with the indispensable and infallible mercury; nor when we have pneumonia to treat, do we, as followers of another theory, keep the patient in a state of intoxication. We do not, as disciples of the Paris school, everlastingly bleed, purge, and evacuate; nor with that of Montpellier, invariably give tonics and cordials. We do not, arguing deductively, treat disease either on homœopathic or allopathic principles; nor do we, on what is aptly termed the expectant

principle, absolutely do nothing for our patient after the doctrine of Mephistopheles, who taught Faust that medical practice "was easy to be caught, you study through the great and the little world, and let things go on in the end as it pleases God. He who avails himself of the passing moment, he is the proper man."

No doubt, what Sydenham recommended in the Fourth Section of his "Methodus Medendi," speaking of fevers, was correct. He advised us to permit nature to do her own work, seeing that we are only required to regulate her when she is exorbitant, and fortify her when she is too weak. What we have to try to find out by symptoms is the direction which nature is taking, and then attempt not to confront but to support and follow her, to essay the restoration of unity of function and structure; for all organic action is an effort at self preservation. Were this more our habit, or more within our reach, we should not be so much guided as we are by fashion. A few years ago iodide of potassium was given by us in almost every form of disease, now the bromide has taken its place.

Does not all this show that we are greatly in want of exact knowledge, not only of the mode of action, but as to what the action is of agents on diseased conditions. Every year, however (and especially is progress in this direction made in Germany as shown by the important investigations of men like Du Bois Reymond, Helmholtz, &c.), we are in connection with our widening knowledge of physics, the "root of the sciences and arts," gaining more precise information, by means of rigid experiment, in this matter. Probably our researches as regards the actions of medicines will be much assisted by the more extended use of the hypodermic method of administering remedies and by increased careful and well-directed experiments on the lower animals. I may here mention the recent highly interesting experiments with the spectrum analysis of Dr. Bence Jones, but lately one of the physicians of this hospital, demonstrating the extreme rapidity with which certain substances, when taken into the system, are diffused probably throughout every part of the whole body. We are aware that certain poisonous agents introduced into the system, such as that of malaria, for example, have a special affinity for and operate through certain parts or textures rather than through others; also, that certain remedies act in the same preferential manner. May not, then, such experiments as those with the spectrum assist in widening the boundaries of our knowledge on such questions?

Perhaps it is vain to expect much real progress in the exact knowledge of the agency of remedies in disease until our chemistry of animal tissues is more certain and advanced, for organic chemistry is still in its infancy; and until we are also in possession of more intimate acquaintance with the action of various agents in states of health, and their discrepancies of effect, according to age, climate, &c., also with the antagonistic effect which many of them exercise upon each other when exhibited simultaneously and with the manner and degree in which the presence of disease modifies their action. To take a solitary instance, how much is our beneficial application of galvanism in practice crippled by the fact of our scanty converseance with its action on healthy persons. In support of the statement that organic chemistry is still but very young and imperfectly developed, I may mention the fact of Chevreul, a French chemist, having quite recently found the existence of no less than twenty-nine distinct elements, separable by chemical reaction in that very ordinary substance called mutton suet. Possibly it also contains, in accordance with the researches of Dr. Bence Jones, a thirtieth substance, viz., the animal quinine-like material.

This result of Chevreul's is akin to that obtained by the destructive distillation of coal which yields no less than fifty-one simple and complex bodies, acid, neutral, and basic, as reported by the Chemical Jury of the last International Exhibition.

May I not here take the opportunity of commenting on the short-sightedness and obtuseness of our British Medical

Council which sets its face against the allotment of even a fragment of its not inconsiderable increase towards elucidation of the physiological action of remedies—a question which might well fall within the functions of our College of Physicians, or Royal Medical and Chirurgical Society to take in hand.

The practice of medicine and surgery are removed from the sphere of empiricism in proportion as they rest upon the principles or science of medicine, that is, upon pathology. I will now pass on to say a few words regarding the latter.

Some there are who have no hesitation in ranking pathology as a complete science in juxtaposition and on a par in scientific attributes with those strictly called sciences with which we are so familiar. As it appears to us, it is, however, still unripe, and as long as so much and so great variety in disease exist, so long must pathology remain as an imperfect science. Even physiology is in many points defective as a true science, the criterion of which is acknowledged to be the tracing in the production of an event, an invariable sequence of causative phenomena. Much more is this the case with pathology which is, so to say, as before remarked, a perversion of physiology, and towards the determination of which so many disturbing elements coincide. Still, of course, we enjoy and inherit from our predecessors most accurate knowledge for our guidance on many points, and are in possession of numbers of indisputable general truths and laws, much more than is the case with the politician, the geologist, or the psychologist; and we may gratefully recall the numerous advances which of late years have been made in pathology—such, for example, as those on the subject of embolism, albuminuria, entozoa, the various kinds of blood poisoning, the conditions of the blood in rheumatism and gout, and though not so recently developed, of reflex nervous diseases, along with many others. We possess in pathology facts as certain, as foundational for superstructure, as the chemical composition of water, the atomic theory, and that on latent heat. Nevertheless, it cannot be said that we are able to anticipate the forms which disease will assume by means of our physiological knowledge, just as I before said, we could not reason out any proper mode of treatment from the ascertained forms of disease. On the contrary, we are in many cases only enabled to conjecture the nature of many varieties of disease by watching the effects of our remedies.

I have perhaps now said enough to excite the suspicion of want of faith both as to the practice and theory of my own profession, and shall probably be considered as sceptical in the powers of medicine as if I had boasted of curing chorea without medicines, or acute rheumatic fever with mint water, forgetting the parts which rest and warmth, and proper food and air, play in the adjustment of all morbid states; and I shall be probably thought to hold the opinion of Voltaire, that the physician is one who puts drugs of which he knows nothing into bodies, of which he knows less; or of Rabelais, who observed, "Happy is the doctor who is called in when the disease is declining." The object which I have, however, had in view in being so explicit regarding the shortcomings of both our practice and principles has not been the discredit of our calling. Far from it. We ought surely to realise our ignorance and weakness as well as our wisdom and strength, and in every sense to obey the commands of the Delphic oracle, to know ourselves. I have thought it right to point out what appears to be certain deficiencies in our methods, as well with the intention of discouraging false expectation, which those fresh to the studies might entertain of their position and character, as of indicating how much still require to be investigated into, of stimulating inquiry, and of pointing out that treasures of medical discovery are open to all comers, and that any individual of those present may, if he will give his mind to the subject, glean many opportunities of doing good service by interrogating nature and adding to the common stock of knowledge, bringing to bear on his observations and guided

thereto by that theorising or imaginative or instinctive spirit (call it what you will), which alone enables the mind to turn observation to good account and prove fruitful. There is also one fact connected with our studies which should be borne in mind—viz., that our profession is such that almost every one of its members, however situated in life, remembering that "most poor matters point to rich ends," and carefully watching in a proper spirit the phenomena which lie about his path, will have opportunities of discovering germs of fresh knowledge capable of development. It is also an acknowledged fact that whatever adumbrations, or surmises, or assurances may exist on any subject as a result of the sagacity and insight of forerunners, those who build on foundations laid by others and complete the structure, obtain the reward; for, as Professor Owen has remarked, "he alone discovers who proves, who converts a speculation into a positive conclusion." For a truth, to be operative or available, it must not only be anticipated, but be demonstrated to the world. Thus, it was to Laennec that we owe our real knowledge of auscultation, though it was to some extent forestated in this matter by Aretæus and Hippocrates and Harvey; and Harvey is the discoverer of the blood circulation, in spite of the approaches to it made by such observers as Reyna, Bruno, Leruetus, Cæsalpin, and Harvey's own teacher, Fabricius. Thus, also, although Hewson's doctrine of central particles foreshadowed that of the "cell nucleus" of our day, his name is not associated with it.

Again, for the newly-accepted theory of the interchange or indestructibility of "forces," the capital scientific achievements of the present century, a preparation was made by Leslie at the beginning of the century, who consolidated, as Buckle says, the great idea of light and heat being identical; and also, I would suggest, by Sir Humphrey Davy, who discovered the laws of the connection between electrical affections of bodies and their chemical powers; but the praise of its full discovery was reserved for others.

Borrowing illustrations from a different region of thoughts, the demonstrator of a theory has the same merit which Raphael obtained, who, though copying the figures of Massaccio, made them his own in his celebrated cartoons and "bettered them," or which has even been conceded to Dante's "Inferno," though originated by his witnessing the acting of the mystery of "Adamo."

I will now proceed to make some observations upon the form into which your work will be thrown in this place; and first, as regards the LECTURES which will occupy a good portion of your time.

Had you been entering at an hospital very many years ago (at a time when degrees at the Universities were granted on the recommendation of three Masters of Arts), you might have found that little or no attendance on medical lectures in London was required at your hands, you would have met with little or no system of teaching in the wards of the hospital; you would have been very much left to yourselves to scrape together, as you well could, such knowledge as the requirements of the various examining boards might have necessitated, and but slight interest would have been taken in you by the authorities. At a period less remote, the number of lectures, of attendance upon which you would have had to procure certificates, would have been so numerous that your time would have been almost entirely passed in the various classrooms; but scanty interval would have been left you for the conflicting practical part of your studies, and your minds would have been confused by the minuteness and multiplicity of subjects taught, or perhaps only wearily attempted to be taught, by those who were little gifted with the faculty of imparting knowledge.

At the present time, a reaction having occurred, I am not quite sure that as regards lectures you have not too few demands made upon you. It is not improbable that in former times, when the body of our profession was, doubtless, not so well recruited as it has been of late, when, from deficient special educational advantages and general

cultivation, students were less competent to read with benefit to themselves, and followed up subjects without the aid of others, it is not improbable, I say, that lectures and demonstrations were more required than they are now, when the imparting of knowledge and instruction generally have become less didactic, and the student is left more to his books, and observation at the bedside and in the post-mortem room is more encouraged and provided for.

At the same time the opposite extreme of error must not be fallen into—that lectures are of second-rate importance or useless. I lay stress on this, for I have some reason for thinking that there is a tendency to fall into this mistake. There are many, doubtless, who, from their knowing how to work, from their methodical habits (possibly the result of greater scope and increased solidity of preliminary knowledge and education now required), from their perseverance of character and realization of existing advantages, may read well and instruct themselves from books, supplementing considerably the lectures which they hear; but these are surely the exceptions, and I feel convinced that in the case of the majority of us, oral teaching and demonstration to the ear, and especially to the eye, whether it be in connection with physical, or theological, or philosophical truth, is incontrovertibly the best means of communicating knowledge, and that we require the distinct personal contact of teachers, and the apt and lively illustration so necessary in giving clearness and precision to statements. If, then, our lectures are diminished in number, the utmost exertions must be made by all to avail ourselves of those which are given, especially of those which are catechetical, and take the form of examinations. Again, a vast number who are very ready and willing to work, and are very industrious when duty is thrown into their hands, become neglectful and inattentive when left to themselves, and even drift away into positive idleness, and all the hydra-headed mischief which issues therefrom.

I say, then, stick closely to your lectures, and afterwards read up their subjects in the various works recommended by your lecturers on their specialties. A good plan is for two students to associate themselves together, and habitually to read and question each other at different stages of progress.

Hogarth remarked that they also confine their studies to the works of the dead, and never hope to live themselves. Therefore, concurrently, and in relation with lectures, and with reading what has been done and said by predecessors, must be combined the watching and study of what happens in the hospital ward and out-patient rooms.

In my opinion this ought to proceed *pari passu* with the lectures, from the very first entrance of the student to the hospital. The outer aspect and diagnosis of disease have mainly to be studied through our organs of sense, and these have to undergo that special training which frequent and continued practice alone can confer. I would then have the student, instead of lounging about the passages or idling and gossiping in the library, to the disturbance of readers, begin by attending the out-patients' practice (especially in the surgical department), wherein physical examination can be learned and practised in abundance, and with facility. Soon after that he should begin to frequent the wards—at first with one or other of the house physicians and surgeons, the dressers, and clerks or registrar at their early visit, not waiting for this frequenting of the wards until any large number of lectures have been attended. Let him on every conceivable point ask questions freely, thinking it no trouble to his seniors, who are indeed always ready and desirous to give any help to those whom they see in earnest about their work. He will soon find how the ear, the touch, and especially the eye have to be called in for assistance in physical examination; and habit, that "memory of the body," as Hunter called it, will soon render all things easy to him. Obstacles will vanish as you become familiarised with your duties on the old principle of "omne ignotum pro magnifico." After a time the

swimmer discards his bladder and begins to act alone, so you will, ere long, begin to examine for yourselves.

You cannot be too much in the wards and in the accident and casualty rooms, provided you enter with your eyes open, bodily and mental; and when you arrive at regular attendance in the wards you ought not to miss a single case that you can help, and I believe you will do well abundantly to take notes, and place on record every circumstance and idea that strike your eye and mind. Although the meaning and importance may not at the time be patent to you, yet the fact which is truly such is not without its signification, and will ultimately find its place, just as the wise artist who makes his frequent momentary sketches, reserves them and treasures them up as a means of fixing temporary impressions for future use.

What is called a common-place book, if well indexed, is a most needful invention, and its use has the recommendation of some of our best thinkers and observers. Then, again, dissection will claim much attention at your hands, and I would strongly urge each of you to procure as much opportunity of this as is possible, for by nothing so much as by methodical dissection, the repeated going over the parts of the body with the scalpel, as with a pencil line upon line, is that knowledge of its structure obtained which is imperatively necessary for every one of us, whether he be surgeon or physician. In addition to the anatomical knowledge obtained by dissection, the surgeon will gain by its practice much of the dexterity in the use of the knife, which is indispensable to him. To many it will at first, for various reasons, appear most naturally (and properly so indeed) very unpleasant—even loathsome; probably to all it will be a trial of patience and perseverance, but conformable to that law of our being, according to which voluntary actions are rendered easier by repetition, this disagreeable duty will in time be more comfortably performed. Only let it be done, as should also be the inspections in the post-mortem room, in a spirit of thoughtfulness and reverence, as mindful of the solemn lessons which the presence of the Angel of Death cannot fail to teach to the well-regulated mind.

A few words I wish to speak to the junior students on some points less professional than the above, but still not quite foreign to his proper interests.

I believe one of the earliest duties as well in importance as in time, that will engage you, coming now, as doubtless in many cases you do, for the first occasion, to form an integral part of this busy human time, and to share in the benefits, but also in the disadvantages and the allurements of a London life, will be the proper choice of friends and companions. Being thrown into close contact with those of whom you can have had no previous knowledge, you will frequently be placed in situations wherein the weight of your character and moral ballast will be tested more than they have ever been before; and upon a right or a wrong step in this particular at this period of your course, the whole tenor of your future life, not only your professional status, but your well-being as men, may absolutely depend. An error in this matter may thus not only prove foolish but disastrous.

Your own good sense and Christian feeling will at once dictate to the necessity of care upon this point. As much as you can for the present, I would say, select your friends from those who, with yourselves, are frequenting the hospital, and take care that they are students whose conduct and habits of thought are such as intelligence, manly uprightness, and purity shall approve.

As respects the general temper and tone of mind which you must import to your work, first of all, I would say, be of good courage. You will at the onset most likely be perplexed by the strangeness of the work, the multiplicity of subjects demanding close attention, and the apparent hopelessness of coping with them; but practice makes perfect, and ere long the misty atmosphere will clear for you, and the relation of the various parts of your work will emerge. Entertain a sober and just confidence in, and appreciation of, the faculties with which you are

endowed, and that proper self-respect, which is equally removed from vain self-assertion, as from craven timidity. If possible, take things easily, but this can only be done by ordering your work regularly, so as to economise time; above all things, by being prepared to meet your examinations when they are due. Use up all your scraps of time diligently, and whatever you do, do it heartily, with the will, with the whole man. In no class of studies are punctuality, perseverance, and determination, rewarded more than in ours. In none is devotion to a single object or purpose more requested. Be of a searching spirit; and take care that there exist among your books some "rugged veterans," as Charles Lamb called them, which you are not afraid to mark and annotate freely. By this means you will be able to fix important passages in the memory, and qualified readily to revert to interesting and more noteworthy parts of your reading. In addition to system in your studies, seek to invigorate attention by variety; this being as requisite to the mind, as change of attitude by relieving the muscles is to the body; and strive to cultivate the power of rivetting your thoughts on what is immediately in hand. This will strengthen powers of remembrance, and give you the alacrity and versatility which will be of such great service in your future profession. Especially take care to study that a proper amount of sleep and time for meals be secured. Amusements and recreation you must have. See that they are healthy, gentlemanly, and free from any species of coarseness. Our characters are not only indicated, but are also much formed, in return, by our amusements; and we all must take care that our refinements and elevation of mind result both from our amusements and our duties. Among the former I would suggest a study of the "History of the Metropolis," in which much are gathered. Every street and corner, and almost every building, has its story and some interesting association connected with it; and such a study will not only supply you with materials of thought for unemployed hours, and prove highly instructive, but furnish you with an interest in your London life which will be enduring.

In conclusion, may I be allowed a word or two to those present, who, having passed necessary examinations, or being on the point of so doing, are about to put off, "in scathed bark," upon the ocean of their future life. All such I would dissuade from undue haste in deciding future plans. We are all nature's pupils; you and I, and every member here present, from the commencement of our professional study to the last day of our practice, and those who are perpetual pupils here will do well to keep about the hospital as long as possible. Of course, in many cases circumstances render it imperative that as soon as qualified you should address yourselves to the duties of your calling, but this is not so with many. The interval between the acquisition of the diploma and the settling down in life, anxiety being removed, is a good opportunity for leisurely going over the ground which necessity has hitherto compelled you to travel across somewhat quietly, and to correct many a wrong impression. I may here advert to the stores of knowledge which by permission of the Medical School Committee may be obtained by any of you from our Pathological Museum, illustrated, as it so remarkable is, by its neatly-printed catalogue, of which a copy rests on this table; and from our registers and post-mortem books, kept, I believe, more accurately and systematically than in any other existing hospital, either at home or abroad. This interval also affords to many the opportunity (one which the trammels of future life may not again permit) of foreign travels, visiting hospitals, and practice of other lands, seeing men and manners, and thus enlarging the bounds of experience in a way which nothing else does so effectually.

Whether you can manage to stay working about the hospital or to visit foreign scenes or are compelled at once to strike into the practical business of life, remember to keep bright and un tarnished the honour of the Alma Mater to which you belong. Seek to attain an abiding realization

of the responsibilities affixed to your position and your calling. You are entering a profession than which none is more varied in character, none more interesting in detail, you will become a member of a most Cosmopolitan Fraternity, and unlike the lawyer whose craft is confined to Westminster, your skill will be called upon and avail you wherever you may go, and like one of some religious order, you will have to go wherever your services may be required. There is no nook or corner among the habitations of men in which you may best find your vocation laid. You may have to spend your life in the colonies, to enter the services of the army or the navy, to sail with the emigrants, or voyage with the scientific adventurer. It may be yours to obey the summons of royalty, you are certain to frequent the cottage of the peasant and the artisan. You will have to be all to all men, to minister to the learned and the ignorant, the gentle and the simple, the open handed and the cheat, the haughty and the affable, the liberal minded and the prejudiced; "to rock the cradle of declining age," and to usher mortals into the world. You will be often censured when you least deserve it, and praised when it is not your due, by a public, which is undoubtedly, and for the most part, grateful, but at whose hands you may, on the contrary, experience the most infamous and litigious treatment, ignorant of the feelings which prompted a wise man of old to observe that nothing but universal friendship could sufficiently repay the benefits conferred by the physicians. In this manner, whilst there is no profession superior to ours in numbers, there is none more conversant with all human interests, and in a position, close and frequent contact with the privacy of men's lives and families, to influence and mould them for good, and to add to the prayers of civilization by diffusing a knowledge of, and encouraging a taste for the study of natural laws. But also no other profession more demands of its members clearness of conception, correct and cautious judgment, ready command of knowledge, exactness in so-called trivialities, moral sense and courage, even honour and nobility of mind under difficulties and emergencies; and there is no profession in which earnestness and enthusiasm, along with constancy and evenness of temper, meet more freely with their deserts.

Such being the character and opportunities of our profession, is it not correct to say that we ought to entertain the deepest sense of our responsibilities, seeing to what extent sacredness of life and reputation, and the happiness of our fellow men are committed into our keeping. What the great Hunter, our Hunter, thought of this responsibility may be gathered from the opinion which he held, that the surgeons, when about to operate, ought never to approach his patient without humiliation.

One word more, and I am done.

There is one thing, which as much as possible must be the foundation of all our intercourse with man and of all our application of this knowledge of laws and principles and result of experience for their good, and that is sympathy with the suffering in mind or body. A patient under the pressure of a fatal malady, tormented with bitterness of feeling, that though his physician was most skilful, yet he did him no good as he had not the faculty of consoling him.

Hippocrates in his definition of the duties of the physician, remarks that he ought not to undertake such diseases as are incurable. We hold no doctrine of that kind. As it seems to me this constituted a main difference between the heathen and the Christian physician; for as we are superior to our heathen predecessors in the possession of hospitals for the sick and dying, so, following a Divine Master, we look upon our powers of affording mental comforts to the afflicted as one of our highest duties and greatest privileges.

Let us, as students of this hospital, not do despite to the memory of men like Matthew Baillie, for example (one of our predecessors at St. George's), who, in the details of medical life, having a firm grasp of knowledge, scientific, and literary, and being one of the most successful and

remarkable physicians which this or any other country has ever produced, never lost hold amidst all his labours and studies of the golden thread of Christian sympathy towards those among whom duty called him. Let us always bear in heart and mind the ever memorable words "*inas much* as ye have done it unto one of the least of these, ye have done it unto me."

(Concluded from page 374.)

PART V.

THE CONNECTION BETWEEN EPIZOOTIC AND EPIDEMIC DISEASES.

THOSE who have had occasion to study the history of the great epidemics which at various epochs have desolated almost every country, must have observed that it is generally recorded that these outbreaks of pestilence amongst the human race have been preceded or accompanied by epizootics among the lower animals. Thus, in his account of the epidemic which ravaged the Grecian army during the siege of Troy, Homer points out that the contagion was first developed in the lower animals—

"On mules and dogs the infection first began,
And last the vengeful arrows fixed in man."
(*Popes, Iliad, i. 50.*)

Livy, too, speaking of the epidemic fever which raged in Rome, in the Roman year 576, stated that the disease was first observed in cattle before it attacked mankind,—
"Pestilentia, quæ priori anno in boves ingruerat, eo vertebat in hominum morbos." (Livy, Lib. xli. 21.)

In the foregoing citations from the early Irish and Anglo-Saxon Chronicles, I have already shown how constantly the connection between cattle plague and some succeeding epidemic pestilence was observed, and consequently I need not here again refer to these annals. I shall, therefore, pass at once to the fourteenth century, so memorable in the history of epidemic plagues, when the "Black death" repeatedly swept through Christendom, and in its irresistible progress reduced the thickest centres of population to all but uninhabited solitudes. And at this time we find that the relationship of epidemic to epizootic disease was well illustrated. Every outbreak of the "Black death" being preceded or immediately succeeded by the appearance of a murrain or plague of a similar type among cattle. This was the case in England, in the year 1348-49, when, as Dr Hecker has observed—"The plague which then seemed to be the sole disease, was soon accompanied by a fatal murrain among cattle. Wandering about without herdsmen, they fell by thousands; and, as has likewise been observed in Africa, the birds and beasts of prey are said not to have touched them." ("Hecker's Epidemics of the Middle Ages," p. 28.) A century later the sweating sickness was also accompanied by murrain in England.

In his "Account of the Plague in London" in 1665, Dr. Hodges states that:—"On the year before the late pestilential sickness, there was a very great mortality among the cattle from a very wet autumn, whereby their carcasses

were sold among the ordinary people at a very mean price; and a great deal of putrid humours in all likelihood produced from thence. And this, in the opinion of many, was the source of our last calamities; and many knowing persons ascribe the pestilence to this origin, as the morbid disposition which such a feeding must needs subject the people, could not but facilitate both the infection and progress of that fatal destroyer." (P. 59.)

In another part of the same work, Dr. Hodges says:—"Moreover, in this regard we may consider the frequent mortalities amongst cattle which forego an infection amongst mankind; for these creatures living for the most part in the open air, not only are more influenced by it when tainted, but are also hurt by the infectious venom which gathers upon the herbage; as, likewise, they are more liable on other accounts to feel its first approaches, because its freest progress is in open places." (*Loimologia, p. 142.*)

In one of the pamphlets on the cattle plagues of the last century, entitled, "An Essay concerning the Pestilential Contagion occasioned by the Distemper now Raging among the Cattle," by Iater, London, 1748, there is a very curious reference to a supposed connection between that epizootic, and what was then called "pestilential sore throat," which seems to have resembled what we now term diphtheria so closely as to leave little doubt they are the same disease. Another writer of that time, Dr. Short, describing some cases of this disease, in 1743, just before the outbreak of cattle plague, says:—"On looking into their mouths, the tonsils, velum pendulum, and uvula were seen covered with a thick white slough which reached but a very little beyond these parts towards the roof. They had a long, rattling, deep inspiration, with a sound as from a metal tube, a livid countenance and . . . a difficult motion of the thorax. But was most remarkable, they spit large pieces of the lining of their trachea an inch and a half or two inches long and as thick as a shilling." ("Short's History of the Air." Lond. 1749, vol. ii., p. 307.) No one that reads this passage can admit that diphtheria is a new form of disease. It is significant that diphtheria was prevalent during the time of the cattle plague in this year, and the attention of the Medical Society was directed to it by Dr. Belcher, who, in his paper on "Diphtheria," alluded to "Iater's" pamphlet.

Observations made in Germany, in India and in this country during the great epidemics of cholera since 1832, show that, coincident with the epidemic cholera in man, the lower animals were affected by an epizootic disease of a similar character. This was extended to animals of every kind, but was more especially observed in the domesticated animals, such as dogs, cats, horses, and cattle; in a word, was of most frequent occurrence in the animals most exposed to the same contagion which produced the epidemic in man.

From these histories of the evident connection between epidemics and epizootics in former times it was not very difficult to foresee the probability of this being again shown by the occurrence of some epidemic on the cessation of the prevailing epizootic. Accordingly, in this essay, which was written early in May, and placed in the printer's hands in June last, although since unavoidably delayed till now, I ventured to predict that the "epidemic constitution," in which the cattle plague had originated and had developed itself, would now, as on former occasions, extend its influence from the lower animals to mankind, and signs of what was termed by the older physicians the "epidemic constitution, or morbid tendency of the season" (words which, I may remark, do not appear to me superseded by any of the more euphonious modern phrases by which a similar idea is still conveyed) were not wanting, even in Ireland, where the visitation of cattle plague was very slight. Some months before any case of cholera was observed in Dublin diphtheria had been unusually prevalent; cases of fever assumed a peculiarly asthenic or low type, the prevalence of puerperal fever led to the closing, for a time, of the

Lying-in Hospital. Such were the precursory symptoms of a "epidemic constitution," or "contamination of the atmosphere," before epidemic cholera made its appearance in Dublin on the 29th of July, 1866, having been imported from England. The outbreak of epidemic cholera in London in the commencement of July and the fearful mortality it occasioned for a time in East London, was, I think, but another illustration of the law that there is some connection, however occult it may be, between pestilences which attack the lower animals and those that invade the human race, and that whenever an epizootic rages we may anticipate that it will probably be followed by an epidemic. Not that it can be imagined that cholera was in any way occasioned by the preceding rinderpest, but simply that both were developed and spread by the "epidemic constitution of the atmosphere" which remained after the cattle plague having exhausted its virulence, was declining; and in which state of the air any zymotic poison would have developed and diffused itself. In this case the zymotic agent was cholera, then slowly advancing on its irresistible progress westwards, but which was probably brought into England by the "epidemic constitution" already spoken of sooner than it would otherwise have been.

In conclusion, the chief point I have endeavoured to prove in this essay is that there is a very close connection between epizootic and epidemic diseases, and that when either form of pestilence appears in any place, we may ere long expect the other to follow. Had this law been more generally acknowledged and acted upon by the adoption of suitable sanitary precautions and some efficient system of quarantine immediately after the first appearance of cattle plague in England, in June, 1865, it is, I think, possible that the mortality occasioned during the present autumn both here and in England might have been at least largely diminished.

THE FORCEPS IN CRANIOTOMY.

By JOHN F. MACEVERS, M.D.,
PHYSICIAN TO THE CORK FEVER HOSPITAL.

THE case of craniotomy published in a late number of the MEDICAL PRESS AND CIRCULAR, in which my name is mentioned by Dr. O'Flynn as having suggested the mode of delivery with ordinary forceps, induces me to make a few observations in connection with the subject. In 1856 I was called to a case of midwifery in which the head was impacted for twenty-four hours, forcible and almost constant pains having taken place during that period without any progress to the labour. The woman's strength failing, I proceeded to deliver with the forceps, and, having introduced the second blade of that instrument with some difficulty, I was unable to accomplish my object, although I used all justifiable force for the purpose. I then determined on perforation, and proceeded to perform that operation in the following manner, assisted by an intelligent medical student, Mr. Wm. Roche, now Dr. Roche, surgeon to H.M.S. *Black Prince*:—The forceps being still in the uterus, I allowed the blades a little freedom by unlocking the handles; the perforator was then introduced, guided by the fingers of the left hand, and the cranium entered without any difficulty. After a portion of the cranial contents had escaped, I locked the forceps and delivered with the greatest ease.

The mother recovered without a bad symptom, and has since borne children.

I thought until lately that this simple mode of delivery, after perforation, originated with myself, and I mentioned it to several practitioners who were of the same opinion, and were determined to give it a trial when opportunity offered. The publication of Dr. O'Flynn's case, however, directed my attention to the writings of obstetricians on the subject of craniotomy, and amongst them I find only two authors who allude to this mode of delivery after perforation,

Ashwell, Burns, Bedford, Churchill, Collins, Denman, Gooch, Murphy, Meadows, Meigs, Maunsell, McClintock and Hardy, Johnston and Sinclair, Ryan, Ramsbottom, Simpson, and several other writers whom I have consulted, are silent on this mode of delivery, whilst nearly all speak of the dangers attending the use of the crotchet and the craniotomy forceps, and recommend the forceps or vectis to be used *before* resorting to perforation.

Gooch, in speaking of the crotchet, says: "You must take great care that it does not slip during the process of extraction, for if it does it may produce a frightful laceration. It is a diabolical instrument, even in the hands of the best practitioners it is a dangerous one."

Meigs (a good American authority) says:—"I have had occasion to feel with many other practitioners how dangerous an instrument is the sharp crotchet."

In Simpson's works by Priestley and Storer, they say: "We have long been convinced that the great peril, not merely of injury but of death to the mother from this operation, arises, in a great measure, from the head being so altered in its presentation, and hence necessarily so increased in its diameters by the mode and place in which the crotchet is fixed, while the cranium is at last torn, as it were, through the pelvic passages by pure physical force alone."

As I said before, nearly all writers on midwifery advocate the use of the forceps before resorting to the *dernier resort* of perforation.

Burns says:—"Where the dimensions and circumstances of the case are barely such as to warrant a belief that the head must be opened, an attempt ought, nevertheless, be made to introduce and act with the vectis or forceps."

Davis says:—"I may be permitted to recommend, as an essential preliminary measure, a very cautious trial of the long forceps;" and that such has been the practice in this country is clearly proved by the numerous cases of craniotomy published by Johnston and Sinclair, as having occurred at the Rotunda Lying-in Hospital in Dublin, for in almost every case of perforation arising from disproportion or malformation recorded by these gentlemen, the forceps were introduced in the first instance, and delivery after perforation effected with the crotchet, and in many cases with considerable difficulty.

Dr. Sinclair, speaking of the practice at the Rotunda Hospital, says:—"We never perforated without first trying to extract the fœtus with the forceps."

Blundel and Rigby, amongst British practitioners, appear to have been the only authors who allude to this mode of delivery. The former, in his "Lectures on Craniotomy," published nearly twenty years ago in the *Lancet*, observes:—"If the contraction of the pelvis be slight and craniotomy be required, those who are in the habit of using the long forceps will probably have first made trial of this most powerful instrument before they have recourse to the destruction of the child; and if it so happen that the forceps are still applied at a time when craniotomy is proposed, it will be better still to leave the instrument on the cranium, as its operation may afterwards tend to facilitate both the operation itself and the subsequent extraction of the fœtus."

Rigby, in his excellent little book, observes:—"On several occasions, when the craniotomy forceps and crotchet have failed to move the head, the midwifery forceps have been applied, and the delivery easily and quickly accomplished." He says also—"By this means the head is equally grasped and compressed, the soft parts to a considerable extent are protected by the blades, and the whole mass brought down exactly in the position in which it presented."

It is also due to a countryman of ours—Dr. Powell, of Enniskean—(*Dublin Quarterly Journal*, Feb. 1864) to state that he advocates the use of forceps after perforation; and shows clearly the great advantages it possesses over the crotchet. The crotchet, as it has been admitted by the best authorities, will slip in the most experienced hands, and may do mischief to the soft parts of the

mother. The best craniotomy forceps, when well applied, will not slip, but it may forcibly tear away pieces of bone, which may do mischief also; whilst the ordinary forceps, grasping the entire head, will aid the tractive force of the operator more efficiently than any other instrument. Every practitioner who has used the forceps must acknowledge the facility with which he is enabled to alter the direction of his tractive force without the slightest risk to the mother; but not so with the crotchet, and not so with craniotomy forceps. In cases of craniotomy, where the forceps is capable of being previously introduced, it must be evident that the obstruction to delivery must be very slight, otherwise the forceps could not be introduced; therefore, in these cases, I would avoid the thorough breaking-up, and sometimes scooping out, of the brain, resorted to by some practitioners; delivery will best be effected with the forceps by giving exit to a moderate share of the cranial contents.

I maintain, then, that in all cases where the forceps has been introduced, and has failed to deliver, perforation having been subsequently determined on, the forceps should be allowed to remain on the head of the child whilst perforation is being performed, as delivery will then be most easily accomplished.

Dr. Griffith, of London, in a late number of the PRESS AND CIRCULAR, takes exception to this proceeding, on the ground that the presence of the forceps must necessarily interfere with the operation. Dr. O'Flynn's case, and mine given in this paper, clearly prove the contrary. In our cases the forceps offered no impediment to the perfectly safe use of the perforator; in fact, the operation can be performed with as little difficulty as if the forceps were not in the uterus. When the perforator is being introduced, of course cases will arise (happily not of frequent occurrence in this country) where, owing to extreme deformity of pelvis, as in the celebrated cases of Osborne and Meigs, the ordinary forceps will be of no avail; and then the formidable array of embryospastics, such as the osteotomist, the cephalotribe, &c., must be resorted to; but, as I have shown that in the great majority of cases requiring craniotomy, the use of the ordinary forceps in the first instance has been recommended by the best authorities, and from my own experience has been always resorted to, I again maintain that perforation can easily be accomplished whilst the forceps is on the head of the child, and delivery can then be best effected by the aid of this safe and simple instrument.

Hospital Reports.

ST. MARY'S HOSPITAL.

(Surgical Cases under the care of Mr. HAYNES WALTON.)

CASE 1.—SCIRRHUS.

THE Winter Session in the operative department in this institution was commenced on Wednesday, the 3rd of October, in the operating theatre, by Mr. Haynes Walton. The first operation was for the removal of a small scirrhous tumour from the mammary region of a female. The tumour was rapidly dissected out, and Mr. Walton made the following remarks:—

"This patient, Gentlemen, had hard cancer of the breast. It is just two years since she came under my care. She was then suffering much pain in the breast and the arm, and the cancer was growing. I removed the entire breast in this hospital. Things went on well, and the wound soon healed. My patient returned to her usual avocation with comfort and unimpaired health till some weeks ago, when pain in the region of the breast induced her to examine the part, and she discovered a little tumour which you have just seen me remove. This is a little cancerous mass. I have cut it in two in order that you may observe the raw potato-like look of it, and squeezed

from it that juice which is so characteristic of cancer." The specimen was passed round for the examination of the class. He continued:—"The tumour you see was developed just above the cicatrix of the last operation. Do not suppose, Gentlemen, that this operation was undertaken to cure cancer. That cannot be done under the present state of our knowledge. I undertake only to release the woman from pain and prolong life. I have explained this to her friends. She will ultimately die of cancer of some form or other, most probably from the development of it in some internal organ. If the first operation had not been performed, ulceration of the breast would soon have followed, and the poor woman would not probably have lived till now, and if she had lived, see what her sufferings must have been. What I have done to-day, is in accordance with the same principles under which the first operation was effected, to relieve suffering and still longer to prolong life. Several years ago I was called to see a lady with an ulcerated cancer of the breast; being worn out with pain, and being emaciated, she had taken to her bed and procured rest only by strong opiates. I removed the whole of the cancerous mass. The patient's health improved, and in six months her health was restored, and she had full enjoyment of life. Five years after that, the absorbent glands in the axilla became cancerous and very painful; I removed five of them, health was again restored, and lasted for four years, when the lady died after a short illness, supposed to be produced by the development of internal cancer."

CASE 2.—AMPUTATION OF FOOT.

The next case was that of amputation of the foot above the ankle. The patient, a young man, sprained his ankle, acute inflammation followed, abscesses succeeded. The tarsus and ankle-joint became carious, and for six years the sufferer had been from hospital to hospital. The condition of the parts was this, considerable swelling and induration of the ankle-joint and tarsus, so that all the natural form of this part of the foot was lost. Ulceration of the integument in several spots, and many sinuses which led to diseased bone. Mr. Walton remarked that in all cases of amputation of the extremities, the operation should be done as low down as possible, in consequence of the less injury inflicted the lower it was done, and the less risk to life. A patient had a better chance when toes were amputated than when a metatarsus; better when a metatarsus was removed than when the amputation was at the ankle-joint; better in the latter than amputation in the leg, and so on up to the trunk, and these were facts not to be lost sight of. In the present instance it was imperative to amputate in the leg. A dissection was made of the amputated part, which was exhibited, Mr. Walton at the same time offering some pathological observations.

CASE 3.—HYDROCELE.

His last operation was that of a hydrocele. We quote some of the words which fell from Mr. Walton as conveying all that need be expressed:—"The injection, Gentlemen, which I shall use for the radical cure is a solution of sulphate of zinc, of the strength of three grains to the ounce. Of course there are many astringents and stimulating drugs which would be quite as potent as the zinc, but I have no knowledge of them, and as the zinc answers every purpose I stick to it. It is rather an old-fashioned remedy. Several years ago the tincture of iodine supplanted the sulphate of zinc. It was then the fashion to use the tincture of iodine as a local application for scores of affections, and after that it was employed to inject sinuses and suppurating cavities, and the tunica vaginalis for hydrocele. Being a new remedy for this latter affection, it was very much puffed, and said to be the most infallible of all injections that had been used.

"It is true iodine does answer, but it is by no means infallible, and according to my experience, we get more failures with it than with the zinc, which nearly always

succeeds. The zinc injection, I must tell you, excites more vascular action than the iodine and gives more pain, but the greater certainty of cure, is more than a set-off in favour of the zinc.

"The manner in which the injection is used, is as follows:—After the hydrocele fluid is withdrawn, the injection should be thrown in with a syringe through a trochar, and kept in the tunica vaginalis till there is pain in the loins and groins, which usually comes on in four or five minutes. Then the fluid ought to be let out."

Mr. Walton directed the patient to have an opiate injection per rectum, if much pain should supervene. Also, that the scrotum should be well supported by a pillow or some cushion placed between the legs. He mentioned that "after this operation there was sometimes retention of urine, the catheter being required; therefore, this is a point not to be lost sight of."

GENERAL MILITARY HOSPITAL,

PHENIX PARK, DUBLIN.

COMPLICATED CASE OF PURPURA HÆMORRHAGICA.

(Under care of Dr. HOGAN, Staff Assistant-Surgeon.)

LANCE CORPORAL W. B., 60th Rifles, ætat 23, of scrofulous diathesis, and the subject of repeated attacks of chronic rheumatism, was admitted into the General Military Hospital, Dublin, on the 20th December, 1865, suffering from tertiary syphilis, with necrosis of the left portion of the frontal bone, which, to about the size of a shilling, was denuded of integument, the surrounding parts being exquisitely tender on pressure. He complained of occasional vertigo, and of severe pains in the joints at night, but never suffered from fits of any kind. He was given hydriodate of potash in grain doses in bark.

On the 20th of January, 1866, he was transferred to my care, being then exceedingly emaciated and anæmic, and presenting the necrosed osseous surface as above described. He had the appearance of a phthisical patient, having a flattened chest, with increased depth of the four superior intercostal spaces, high temperature of skin, and quick small pulse, 102 per minute, with cough and purulent nummular expectoration. The two inferior thirds of the thorax expanded and arched forwards on inspiration, while the upper third remained fixed. The sternum and sternal end of right clavicle were thickened from syphilitic periosteal deposit, and there was well-marked dulness over both pulmonary apices, while the stethoscope revealed cavernous respiration, bronchophony and gargouillement on both sides. He was put on a liberal diet with porter and wine, and was given a drachm of the syrup of the triple phosphates of iron, quinine, and strychnia, in half an ounce of oleum morrhue three times a day. As he complained of great thirst he was allowed oranges to suck.

On the 7th February, the patient became prostrated, though there was no symptom of hectic fever, and he suffered from slight œdema of both ankles. The heart was carefully examined, but except that it appeared more exposed to the anterior wall of chest, from the shrunken condition of the pulmonary tissues, it presented no abnormal character. His urine was found to be not albuminous. Both legs were lightly bandaged, and the œdema disappeared on the 15th. On the 17th of the same month he complained of insomnia, pains in the legs, great thirst, and exquisite sensitiveness of the skin (the slightest touch giving him pain). His tongue was furred, pulse 115, and purpuric spots the one-fifth of an inch in diameter, not affected by pressure, appeared on both legs, and three days subsequently over the trunk and arms, but upon these parts they were not so well marked as upon the lower extremities. He suffers from anorexia and nausea,

and has copious sanguineous expectoration. The pyrexial signs have subsided.

21st. Large purpuric patches over the scapulæ, sacrum, calves of legs, elbows, have formed by the coalescing of the spots. The knuckles of the left hand from a trivial injury, are ecchymosed and bleed profusely.

23rd. He has been unable to keep anything on his stomach for the last fourteen hours, but vomits copiously of a dark, greenish opaque fluid, speckled with jet black corpuscles. He suffers also from hæmatemesis. Ordered a sinapism to epigastrium and some powders composed of bismuth, opium, chalk, and soda.

24th. The vomiting and purging have ceased and the purpuric spots are disappearing, while the patches increase in size and in depth of colour. He is exceedingly weak and restless, and suffers from aphonia. To have brandy and egg-flip with the port wine.

26th. The black vomit and hæmatemesis with tormina and tympanitic abdomen have recurred. The patient complains of cold, and there is a great decrease in the temperature of the body, which presents a general bluish appearance. To take gr. x. tinct. ferri. perchloridi every fourth hour, and an opiate at bed-time; hot jars to the feet.

28th. Has slept well, and is better; the vomiting has ceased, and the diarrhoea has much diminished; does not complain of pain, and he has regained his voice.

March 1st. He had not slept during the night, but felt strong and sat up in bed in good spirits, being in a talkative mood. At seven A.M. he asked for a drink, and then fell off apparently asleep. On his demand being attended to by the orderly he was found to be dead.

Post-mortem appearances twenty-nine hours after death.—Rigor mortis well marked; the purpuric condition of skin is as before death; subcutaneous tissues are congested.

Nervous system.—The arachnoid is dotted over with purpuric spots, and is thickened and opaque in several places; subarachnoid spaces filled with serum; the pia mater is congested and ecchymotic in three different situations; brain substance is in an anæmic condition; the ventricles are distended with serum, while the choroid plexus are engorged.

Circulatory system.—Pericardium covered with spots; heart atrophied; valves stained by sanguineous imbibition; no sub-endocardial hæmorrhage.

Respiratory system.—Vocal chords thickened and roughened; both lungs infiltrated with tubercle; large vomica in right pulmonary apex; large quantity of uncoagulated blood in left pleural cavity; left pleura thickened, opaque, and adherent at apex.

Primæ Viæ.—Serous coat of stomach spotted with purpuric dots; mucous coat much corrugated, thickened, roughened, and ecchymotic, and stained black (no abrasion) near pylorus; small intestine spotted; ileum stained with deep-coloured purpuric patches and thinned; large intestine normal.

Liver is very much enlarged, and presents all the characteristics of amyloid degeneration, being abnormally heavy and solid, smooth and well-defined in outline, of a pale waxy colour, and capable of being readily cut into very fine translucent sections, which, when examined microscopically, presented a number of sago like transparencies, while the hepatic cells and vessels are ill-defined. It also gives the peculiar deep violet red colour when acted upon by Dr. Aitken's solution of iodine.

Spleen slightly enlarged, of a dark chocolate colour, much congested and softened.

Kidneys were normal in size, shape, and outline; the cortical positions are congested, while the pyramidal are anæmic. They give but a faint reaction when treated with the iodine solution.

Dr. Hogad regrets that, being ordered to Colchester Camp in medical charge of troops, he was unable to complete the examination of this interesting case with all the minuteness of detail which it deserved.

THE CHOLERA WARDS OF THE HOSPITALS OF LONDON.

UNIVERSITY COLLEGE HOSPITAL.

SINCE the epidemic began to occupy a larger area, and especially towards the northern districts, other hospitals have succeeded the London in becoming centres of help. At University College Hospital four large wards have been appropriated to cholera cases. Into these 84 patients have been admitted since the beginning of September, 60 being cases of cholera, and 24 diarrhoea. Up to the 12th, 30 deaths had occurred. Dr. Ringer and Dr. Fox have treated most of them. In some of the cases no drugs were administered, but this method does not seem to have found as much favour as we had anticipated. Yet it will have, we doubt not, a fair trial. Water, iced water, and iced saline water, have been allowed as drinks. The injections into the veins have been tried in two cases, but both ended fatally. The fluid employed was twelve grains of carbonate of soda to a pint of water at 104 Fahr. Kino, sinaba cednon, and other astringents have been employed, as well as sulphuric acid. In some cases starch enemata were prescribed.

MIDDLESEX HOSPITAL.

OUT of five cases which have been treated by Dr. Greenhow, with small doses of calomel, four have recovered. This is certainly a great success, and we understand that in the two previous epidemics, the same physician found this plan, if not equally useful, more uniformly successful, than any other. A case has been treated at this hospital by venous injections, but this also terminated fatally. It was under Dr. Murchison's care. The fluid employed was—

Sodii chlor. ℥iss.
Potass chlor. ℥ss.
Sodæ phosphatis gr. x.
Sodæ bicarb. gr. v. Aq. oij.

The temperature of the liquid was only about 100 Fahr. at the commencement of the operation and as this occupied more than half an hour, it would then have fallen some degrees. Thus fluids above and below, as well as at the same temperature as the blood, have been injected on different occasions. In the case named, the usual marked improvement followed the injection at first; but before the operation was over the patient had begun to relapse.

In reference to the time occupied, we may repeat what we stated a few weeks ago—viz., that at the London Hospital, where the injections have been most tried, experience seemed to show that those cases did best in which not more than a quarter of an hour was occupied in the operation.

We may further take the opportunity of adding that hitherto the injections seem only to have been tried in the very worst cases, so that the recoveries under this treatment, though not numerous may after all prove more encouraging than a hasty glance at mere numbers might indicate.

There are, too, a number of details respecting the operation itself which ought not to be omitted in any comparative estimate of its value.

DISTRICT CHOLERA HOSPITAL.

CASES have come under the care of both Dr. Woodman and Dr. Heckford, in which the rose rash of which so much has been said has been very well marked, and cases too in which no opium had been given, and in which therefore there could be no pretence for assigning its appearance to the influence of that drug. One case was treated with chloroform, another with quinine, a third with champhor. It is not improbable that in one of them, at least, calomel had been exhibited before the patient was brought to the hospital.

The rash is usually raised, and in patches, more or less

distinct. There is little or no itching or smarting. It appears from the sixth to the twelfth day, subsides mostly in about three days, and is followed by desquamation. The urine is albuminous during the continuance of the rash, and sometimes after desquamation. Under the microscope it is seen to be charged with tube casts and epithelial cells. These symptoms seem to corroborate the notion of some observers as to the analogy of cholera with the exanthemata, and when we add that angina has been observed to accompany the disease and glandular enlargements to follow, we may be prepared to give more attention to some of the pathological records that point in the same direction.

THE CHOLERA.

LONDON.

THE warnings which we last week placed on record were early repeated by the general press, and received the same confirmation from the official returns as on several previous occasions. The deaths in the London districts during the fortieth week of the year, which ended on Saturday, October 8, were 1,344, equal to 109 in excess of the estimated average (corrected for increase of population), which is 1,235. Of these deaths 182 were caused by cholera, and 69 by diarrhoea, as against 177 by cholera, and 67 by diarrhoea in the preceding week. It will be at once remarked that the increase is mainly in the more serious disease, and when we add that the disposition to spread has also become more manifest, so that the whole of the London districts now suffer from the epidemic to a greater extent than a few weeks ago, we have said sufficient to enforce the suggestions made in our recent numbers. With these facts before us we cannot avoid some regret that the Registrar-General has ceased to publish daily returns.

The public requires to be constantly warned of its danger, and local boards are too apt to fall back into the apathy from which fear has aroused them for a short time. The medical officers of health have long enough had to contend alone against the indifference of those boards, and nothing short of a panic has sufficed to enforce the advice of professed sanitarians. Before the excitement passes away is the only opportunity for health officers to gain a hearing. If daily returns seem too frequent, we think the Registrar might well afford us an epitome twice a week; or if this be not conceded, we trust at least that the newspapers will be supplied with a statement of the number of deaths occurring daily in each district.

The following shows the distribution of the disease during the week:—

	West.	N.W.	Central.	East.	South.
Cholera . .	16	37	31	50	48
Diarrhoea . .	8	8	18	17	18

Of other zymotic diseases there were 31 deaths from small-pox; 29 from measles; 57 from scarlatina; 13 from diphtheria; 23 from whooping cough, and 44 from typhus.

The annual rate of mortality fell 1 in London in the week; rose 2 in Edinburgh, and fell 6 in Dublin.

The exact figures were as follows in London and the twelve towns, several have been reported during the week:—In the month of September, 1865, the deaths from diarrhoea in Wigan were 9; from all causes, 67. In September, 1866, the total mortality was more than double—viz., 140; the deaths from diarrhoea numbered 23, from cholera and choleraic diarrhoea, 29, or a total of 52 from the two diseases, as against 9 in the same month of last

year. The last weekly return issued gave 10 deaths from cholera, 4 from choleraic diarrhœa, and 5 from diarrhœa, or a total of 19, being an increase of one-third over the previous week.

MANCHESTER.

Only 4 deaths from cholera were reported during the week in Manchester and Salford. In the previous week, as we have already recorded, there were 14.

DUBLIN.

In Dublin, happily, the returns show a decrease in the number of deaths, which were 81 as against 98 in the previous week; but the disease, nevertheless, exhibits a tendency to spread towards the southern suburbs. It remains to be seen whether this decline will be sustained. If so, Dublin will have experienced but a light visitation, the weekly deaths from cholera having been in the following order—41, 52, 55, 65, 98, and 81.

An influential committee has been formed, under the auspices of the Lord Mayor, to organize relief for families, and which, we trust, may be as servicable as the similar committee in London has been. It was stated by Dr. Burke at this meeting that the Dispensary Physicians had always rendered most valuable services; that more than 3,000 cases of diarrhœa had been treated by these gentlemen at all hours of the day and night, and that between 300 and 400 deaths from cholera had occurred. Dr. Mapother, the Medical Officer of Health, reports some distressing cases that had come under his personal notice.

LIVERPOOL.

From 116 deaths from cholera in the preceding week, we have to report a decline to 99, fully justifying the encouragement we offered in our last report. This decline has been gradual, as will be seen from the following figures for the last eight months—157, 146, 225, 145, 182, 159, 116, and 99. This decided decrease has admitted of the closing of the cholera sheds, and the dismissal of about half the medical staff and house-visitors. Whether the last step is not hasty may be doubted, considering that the mortality of Liverpool, apart from cholera, has long been excessive; and its death-rate is now to London as 41 to 23. How much wiser would it be to continue the utmost exertions until the mortality of the borough cease to be a danger to the country!

THE CONTINENT.

From a number of contradictory reports we may perhaps gather that the disease has not, on the whole, diminished, but rather progressed, although it has left some towns to attack others. From northern Italy the accounts are favourable. In Venice, out of 71 cases, 35 proved fatal. In Trieste about eight cases a day were occurring during the first week of the month. The total number of deaths from the beginning of the epidemic there to October 2nd was 621. On the same date Genoa had four cases, of which three proved fatal, but this was more a fatal day than usual. From Naples the accounts are still anything but reassuring. Four of five thousand persons have probably perished from the epidemic in Naples. The mortality has been at a terrible ratio, about 75 per cent. of the attacks. In the first week of October there were still from 60 to 90 cases a day, and from 60 to 70 deaths. Moreover, the suburbs hitherto exempt have been invaded. Even Castellamane and Sorrento, to which the citizens had fled to evade the plague, are now suffer-

ing severely. It is to be hoped that the lesson now being learned by the Neapolitans may not be so speedily forgotten as others of years past. The recent political events in Palermo have been followed by an outbreak of the disease. It first appeared among the troops, but there are reasons to fear that it may largely affect the whole city.

Reviews.

ON EPIDEMIC DIARRHŒA AND CHOLERA: their Nature and Treatment. By GEORGE JOHNSON, M.D. Lond., Physician to King's College Hospital. Pp. 32. London: Hardwicke.

ON THE NATURE OF CHOLERA, as a Guide to Treatment. By WILLIAM SEDGWICK, M.R.C.S. and L.S.A., Surgeon to the St. Marylebone Provident Dispensary. Second Issue, with a new Section on Treatment. Pp. 200. London: Walton and Maberly. 1866.

ON THE TREATMENT OF ASIATIC CHOLERA. By ARCHIBALD BILLING, M.D., A.M., F.R.S. New Edition, Revised. Pp. 14. London: Churchill and Sons. 1866.

A SIMPLE EXPLANATION OF CHOLERA: and a Rational Mode of Treating it. By YON, M.D. Pp. 16. London: Renshaw. 1866.

ON CHOLERA: its Nature and Treatment. Being the Debate in the Harveian Medical Society of London. Edited by Dr. C. DRYSDALE, Honorary Secretary of the Society. Pp. 34. London: Hardwicke. 1866.

WE have grouped these works together in order to economize space, and we may remark of them collectively that they present the most varied opinions as to the nature and the treatment of the disease which has again reached our country. Nothing, in fact, more clearly proves the mysterious character of the malady than the conflicting views entertained by those who have witnessed its ravages, and the unsatisfactory results of treatment are perhaps equally manifest from the variety of remedial plans recommended for adoption.

Dr. George Johnson is well known both to the medical and general public as the strenuous and persevering advocate of what is called the eliminative treatment. His present pamphlet consists of the reprint of a Review of his work entitled "Notes on Cholera," published in the *Saturday Review*, and of the reprint of an article of his own published in the pages of a contemporary medical journal. The review, as may be supposed, is eulogistic of the author's views, and is stated to be written by a physician of the greatest authority and eminence. Dr. Johnson's own paper is a brief recapitulation of the theory he entertains as to the nature of cholera, and as to the efficacy of his eliminative treatment, in which castor oil still holds a place, although not so prominently as heretofore in Dr. Johnson's writings; and it will perhaps surprise some practitioners to learn that he recommends *venesection* as beneficial, although only when there is rapid breathing, with a feeling of impending suffocation.

Mr. Sedgwick fixes upon the semilunar ganglia, the solar plexus, and the adjoining portions of the sympathetic nervous system as the probable seats of disease in the primary symptoms of cholera, and his chief reliance, in treating the malady, is upon *venesection*. Agreeing, as he does, in some measure, with Dr. George Johnson, in believing that there is great congestion of the venous system in cholera, he believes that relief will follow from this mode of depletion, and he combats the arguments of those who maintain that the debility of the patients contra-indicates the measure. He adduces a considerable amount of evidence in favour of the plan he recommends, most of the cases so treated having occurred in India, and he himself has tried the remedy, as he states, in India, with considerable success. Still, we

must observe that the evidence is not very strong as to the remedial powers of the lancet in cholera, and we doubt whether Mr. Sedgwick's arguments will induce many practitioners to resort to its use.

Dr. Billing is well entitled to be heard as to the treatment of cholera, for he has witnessed several epidemics of the disease, and his opinions are matured by reflection and experience. He regards cholera as a species of fever, the cold stage of which is the ordinary cholera, and the hot stage is the subsequent febrile reaction, known as consecutive fever. As he entertains this view, the treatment he recommends for cholera is that adapted for fever, and consists in the administration of saline aperients and tartar emetic, and he adduces a few cases in which this plan has been followed by success. We fear, however, that the recent experience at the London Hospital, of which Dr. Billing was formerly one of the physicians, has not proved the efficacy of this or any other particular method of treatment.

Yod, M.D. (which is of course a pseudonym), regards cholera as a blood poison and he conceives that the evacuations are designed by nature to eliminate the poison from the system. It is, therefore, the duty of the practitioner to assist nature in her work, and the best way of doing so is, according to the writer, to give plenty of water in order to wash away the morbid matter, and restore the fluid carried off in the evacuations.

The pamphlet on cholera which stands last on our list, is a reprint of a debate on the subject in the Harveian Society, and it has already appeared in our columns. It is a most able *résumé* of all that is known on the subject, and is edited by Dr. Drysdale, the indefatigable Honorary Secretary to the Society.

CHOLERA NON-CONTAGIOUS: and the Absurdity of Quarantine Regulations Demonstrated. By EDWIN HEARNE, M.D. Lond., &c. Second Edition. London: Simpkin and Co. Southampton: T. Gutch.

THE object of this pamphlet is expressed with sufficient precision in the title. At the present moment when the doctrine of contagion seems to have found fresh support in so many quarters, it requires a considerable amount of courage to come forward as the champion of the opposite view. With the decision of one fully convinced of the truth of his opinions, Dr. Hearne boldly calls quarantine absurd, and, in addition to his own experience at Southampton, cites that of numerous other equally able and independent observers in various localities. Those who were present at the debate which followed the paper on cholera read by Dr. Tilbury Fox at the Harveian Society last year, are well aware that many hesitate to ascribe to the disease any contagious property, and from what we gather from those who have had to treat it in the several London hospitals during the present epidemic, we think that the theory of contagion has not made so much progress amongst these gentlemen as it has in the press. Indeed, we know that several of our leading practical physicians repudiate the notion in private, although they do not feel inclined to enter the arena of controversy on the subject.

We, therefore, welcome the pamphlet under notice as affording a protest against a too hasty adoption of the notion that has recently been most in favour. It fairly warns contagionists against accepting as proofs what are only evidences of the possibility, or, if they will, the probability of the truth of their theory; while it directs attention to certain other evidences which would seem to point in the other direction. We are not anxious to reopen the whole question, although few can lay claim to a greater importance, nor, in the interest of humanity, should a re-examination of the facts be neglected.

Dr. Hearne has strong opinions, and expresses them in vigor-

ous language. We commend his work to his opponents. At the same time, we should be glad to see the facts offered by contagionists subjected to the sifting process by such a writer as Dr. Hearne. He might confer good service, for example, by a scrutiny of the report of the International Sanitary Commission. But for such an examination, the fluency of the advocate ought to be laid aside for the terseness of the judge. The author of "Cholera Non-Contagious" would probably feel more at ease as a partisan; even in the capacity he might usefully employ his undoubted talents.

CHOLERA: What it is, and how to Prevent it. By EDWIN LANKESTER, M.D., F.R.S. London: Routledge and Sons.

THIS is a popular sixpenny hand-book prepared by the energetic coroner, who is also medical officer of health for St. James's district, and editor or writer in several periodicals. As such its most important part relates to prevention. Dr. Lankester believes in contagion. He considers that cholera owes its origin and extension to a poison secreted in the alimentary canal, and declares that all who have anything to do with it "should act as though it were the most contagious of diseases." He would have every case of diarrhoea treated as cholera when the latter is epidemic. We are surprised to have to say that his chapter on disinfectants is very defective. The whole book bears marks of the extreme haste with which it has been written. Many sentences are involved and obscure, and some statements made us pause in reading. The author is not likely to gain in reputation by a volume so loosely put together. He confesses, indeed, that his object is not to instruct the medical student; and this is perhaps a fair preface to a description of the disease in these words:—"The havoc of the tornado in a tropical forest gives but a faint image of the effects of this poison when once it has gained access to the wonderful mechanism of the human frame." We agree with the author that the tornado gives but a faint image of cholera; but as a comfort he adds the following paragraph, whatever it may mean:—

"The intense interest excited in the mind of the scientific inquirer, is the guarantee that as long as this disease shall be a scourge to mankind, so long will there be intense, minute, and anxious research into the nature of that chain of causes which results in the wonderful and disastrous effects of this disease upon the human body."

This, which is a fair specimen, will be probably more appreciated by the public than the profession, and perhaps as the author advises a medical man to be sent for at once by any one suffering even from diarrhoea, we need not be too critical as to his rules for treatment. He recommends the patient to go to bed, and take a dose of opium. His dose is, "a third of a grain of opium after every liquid evacuation." He adds, "half the dose for an adult should be given to children under ten years of age, and from a drop to two drops of laudanum for children under five years of age." We should strongly condemn the public being advised to administer opiates to children in this manner. In fact, it might lead to making Dr. Lankester's personal acquaintance at an inquest in his office as coroner. Laudanum should not be given to infants without the sanction of a medical man.

CHOLERA: Its Cause, Pathology, and Cure. By J. PIDDUCK, M.D. London: Hardwicke.

THE author may at least lay claim to the praise due to brevity, for he disposes of the cause, pathology, and cure of cholera in a pamphlet of twelve pages. He says it must be primarily traced to a Divine visitation—the "mysterious poison must come directly from God." As to treatment, he is thoroughly practical. He considers "it is safer to do

nothing than to injudiciously interfere and stop the diarrhoea. He therefore condemns astringents and opiates, and asserts that rational treatment consists in—1, diluting the poison; 2, assisting the natural efforts to expel it; 3, subduing febrile symptoms; 4, allaying irritation. The evacuant recommended is a salt-emetic. This may be followed by a pill of a grain of calomel and three of rhubarb, and a dose of castor-oil. Against consecutive fever, salt, bicarb. soda and chlor. potass, combined as in Stevens's saline. Dr. Pidduck says that "the primary effect of the salt-emetic is to stop the serous evacuations," and relates two cases in support of his views. The pamphlet is so brief, though clearly enough expressed, that it will no doubt be read by those into whose hands it may fall.

THE HUMAN BLIGHT AND THE CATTLE BLIGHT. London: Longmans.

This is an anonymous pamphlet in which the author asserts that a *blight* of insects causes cattle plague and cholera. The insects destroy the mucous membrane of the alimentary canal. The antidote needed is something that will destroy the insects and their eggs. Tar-water has this power. The author says he is not a medical man. Had he been so, whatever his views, we hope he would have learned to offer arguments in place of mere assertions.

JOURNAL OF SOCIAL SCIENCE.

The last number contains some comments on the Sanitary Act, 1866, by Mr. W. H. Rumsey, written with especial reference to the administrative machinery constituted by former enactments, and suggestions for its improvement in a future consolidation of these statutes.

Among the lighter articles is a paper on ladies' dress, and as it is evidently from the pen of a well-known lady, we trust it may meet with the consideration due to it. Men have so long found the utter futility of resisting the fashion that it is time a female pen came to the rescue.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 17, 1866.

THE PROGRESS OF CHOLERA.

It would be most gratifying to us to be able to announce, as we hoped to do, that the insidious enemy which has been visiting our land had taken its departure from our shores, but we fear that it would be premature in us at present to presume to congratulate ourselves upon any such deliverance. It is true that in the eastern districts of the metropolis, where the disease has hitherto prevailed to a fearful extent, there is now a marked diminution in the number of cases, but unhappily many of the other districts of London are suffering from the invasion of the pestilence, while in the English provinces fresh outbreaks are almost daily recorded. Indeed so far from the returns exhibiting a tendency towards the disappearance of cholera, we actually find that the number of cases now reported in one week exceeds the number of those occurring in a corresponding week of the month of September, so that the disease may actually be said to be on the increase.

On analysing the returns, also, the results are by no means reassuring as to the subsidence of cholera, for we find that the increased mortality occurs in those districts which have hitherto escaped. We know that when the disease was at its height in the east of London, nearly all the other districts were unattacked, or at any rate the death-rate was insignificant, but now the deaths in the eastern and in other parts of London are equalised, and though not at present numerous, they sufficiently indicate the continuance of the existence of the cholera poison among our population, and forbid us to indulge in any very sanguine hopes that we have seen the last of the disease.

It would be quite idle to suppose that the approach of winter and the consequent prospect of cold weather will necessarily exterminate the seeds of the cholera miasm, for although it has happened in several previous epidemics that the chief outbreaks in this country have occurred in the summer or autumn, and have declined as the year advanced, yet even in England, and in London, the disease has frequently manifested itself in the depth of winter, even while the snow was lying on the ground, and in other countries, as in France, it has raged with deadly virulence throughout the winter, and even such cold climates as Russia have been no proof against its ravages. Nor can it be said that abundant rains will invariably cause the entire cessation of the epidemic, although this kind of agency really seems to exercise a certain controlling influence, for the experience of the August and September of the present year forbid us to place implicit reliance upon such a meteorological condition of the atmosphere as a sanitary safeguard. What the mortality of cholera in the season just passed might have been if the weather had been dry and sultry it is, of course, impossible to determine; but we know perfectly well that it has pursued its course in spite of the existence of rains more abundant and continuous than any known for a long period.

It is therefore, with some surprise, and, we may add, dissatisfaction, that we find the daily returns of cholera discontinued by the Registrar-General. If indeed we could convince ourselves that the late visitation had so aroused the energies of the local authorities as to induce them to take in all instances the necessary sanitary precautions, we might possibly cease to agitate the subject, and we might deprecate the continued publication of daily reports as calculated to inspire unnecessary alarm. But such sanitary activity by no means exists, and while the well-to-do classes have forsaken the capital and betaken themselves to the retirement or the amusements of the country, those who are left to watch over the health of the community are well satisfied to repose in the fancied security which is imparted by the silence of the authorities as to the existence of danger. Hence sanitary improvements, if begun at all, are discontinued or neglected, and if not yet commenced, there is very little probability of their being even proposed. The experience

lately gained as to the action of local boards is pretty much the same as it has ever been—namely, that when disease actually breaks out there is a show of zeal, and useful measures are adopted, but as long as the danger appears only in the distance, very few steps, or perhaps none, are taken to guard against it. It is only by a daily appeal to people's reason, or it may be, even to their fears, that sanitary reform has any chance of being effected, and we therefore regard the discontinuance of the daily reports of the progress of cholera as a most serious discouragement to the labours of those who are conscientiously devoting themselves to the hygienic improvement of our population.

Since the above was written, a paragraph has appeared in the papers, stating that the discontinuance of the daily reports has not been ordered by the Lords of the Council, and it would seem that the Registrar-General has himself taken the step. We may add that the clerks in the Registrar-General's office have received no increase of pay for the extra duties they have performed during the last two months, and this may be the reason why their labours have lately been abridged.

THE SUPPLEMENTAL CHARTER OF THE QUEEN'S UNIVERSITY.

THE events of last week, both at Senate and Convocation, are likely to exercise a most important influence on education in Ireland and on medical teaching even more than other branches. To recapitulate the facts.—The Queen's University has hitherto given degrees in medicine for £5 to any candidate *who had attended three months* in the Colleges of Belfast, Galway, or Cork—In spite of very great inducements in the shape of scholarships and prizes, the demand for these degrees was comparatively small and the University languished—On the recommendation of the late government, her Majesty executed a Supplemental Charter assimilating the institution to the London University, and admitting all comers to examination without the necessity of a residence at a Queen's College. This new Charter met with the most unflinching opposition from the friends and dependents of the local colleges and generally from the "hot" Protestant party, who viewed with displeasure the admission of the Catholic University to a participation in the University degrees.

Last week the Senate met for the second time to determine the acceptance or rejection of the New Charter, in the presumption, apparently, that they were competent to decline the express act of the Queen. The Old Charter and Queen's College interest was represented by Sir ROBERT PEEL and Lord Chancellor BLACKBURNE, and the New Charter and freedom of education by Ex-Chancellor BRADY, Sir DOMINIC CORRIGAN, and Mr. MONSELL. The details of the sitting did not meet the public ear, but rumour says that the warmth of discussion almost reached the last and most cogent personal appeal, and the debate terminated in a

division of eleven ayes—*i.e.*, for the New Charter—and nine noes. Three days subsequently the first Convocation of the Graduates met for the purpose of electing a member of the Senate from their number and discussing the New Charter. The Queen's College and Old Charter party was represented, as we understand, by no less than forty-five professors, valiant, of course, in defence of their hearths and homes, and almost an equal number of Protestant clergy, not, as may be imagined, favourable to the incursion of the Catholic University in their preserves. This party supported Mr. ROSS for the Senate, while the New Charter, rank and file, voted for Dr. MAPOTHER.

The conclusion was easily anticipated, the Old Queen's College party triumphant, their candidate in a large majority, and the New Charter scouted indignantly. The result of these meetings is, of course, at present a matter of conjecture.

We believe that the disclaimer of the Convocation will have little weight with the Government, and that the New Charter will be carried out in its entirety. It would, indeed, have been a matter for surprise if the Convocation, so largely composed of Professors voting for themselves, and clergymen for their religion, had arrived at any other determination. On the other hand, the present Government are not bound to the acts of their predecessors, and are naturally inclined more to the Conservatism of Belfast than the Liberalism of Dublin. Yet we hardly think they will recommend the reversal of her Majesty's Act. Lawyer's opinions, worth exactly the fee paid for them, have been obtained adverse to the validity of the New Charter, and at present the matter awaits the decision of the Lord Lieutenant.

THE M.D. (HONORIS CAUSA) OF THE QUEEN'S UNIVERSITY.

AT the Meeting of Convocation, which will be found fully reported in our columns to day, Dr. O'FLYNN asked the Vice-Chancellor whether a degree of Doctor of Medicine had been conferred on a gentleman who had never passed any examination, and had never gone through any medical course whatever? The Vice-Chancellor replied, that he could not answer the question, and that a notice of motion must be given previously to the question being brought forward. Fortunately for the profession, the press requires no notice of motion, and we take leave to amplify and repeat the question.

Is it true that the degree of Doctor of Medicine (Honoris Causa) was conferred at the last commencements of the University on Professor J. R. GREENE of Cork, and is it true that the medical qualifications of that gentleman are solely such as are derivable from a scanty experience of the practice of pharmacy? Furthermore, we beg to inquire whether the degree was conferred with any ulterior object, and whether it is the intention of Professor GREENE to compete for a

vacancy, for which a Doctorate of Medicine is an essential qualification? It is needless for us to say that we fully recognize the distinction which Professor GREENE has attained by his studies in Zoology and Comparative Anatomy, and notably by his "Manual of the Cœlenterata;" but we must decline the assumption that these attainments can entitle him to honours in medicine. We recommend very seriously to the Medical Council the consideration whether they can permit the establishment of this precedent—a most dangerous one for the profession.

We can hardly credit the current report that it is Professor GREENE's intention to offer himself as a candidate for the Professorship of Botany in the University of Dublin, inasmuch as by Act of Parliament the Professor holding that Chair must be Clinical Physician to Sir Patrick Dun's Hospital, and deliver Clinical Lectures to the students of the School of Physic.

Notes on Current Topics.

THE SOCIAL SCIENCE CONGRESS AND THE SICK POOR IN WORKHOUSES.

THE condition of the sick poor in the English, and especially the metropolitan workhouses, has formed the topic of discussion at the recent meeting of the Social Science Congress. In a paper on the subject by Mr. S. W. North, the writer exposed the defects of the existing system in the most forcible terms, and laid the blame principally upon the Poor-law Board, which had the power to ameliorate the condition of the sick poor, but had entirely neglected to do so. In fact, the paper might have been a reprint of the articles which we ourselves have written on the ill-treatment of the sick poor, so exactly do the sentiments and statements of the author coincide with our own. In the debate which followed the reading of the paper, the speakers, in the main, admitted the truth of the complaints so often made and reiterated against the working of the system, and they agreed that the medical officers of the workhouses ought to have a more honourable position than they at present occupy. But Sir Walter Stirling threw out a suggestion which we never heard made before—namely, that the medical officers should attend the sick poor in workhouses gratuitously, and that they should even pay for the honour of holding such appointments! Sir Walter must surely have intended to be facetious in this proposition, but for our own part, we think that if he intended it as a joke, it was a very heavy one.

THE REGISTRATION OF MEDICAL STUDENTS.

It may not be generally known that the Medical Council has passed a resolution to the effect that all medical students shall register their names, the medical school to which they have entered, their attendance on lectures, and the date and place where they passed their preliminary examination. This registration is ordered to take place at the office of the Medical Council, Soho-square, London, or at one of the other offices of the Council in Scotland, Ireland, or the English provinces, and this inscription is intended to supersede the necessity of registering

at any of the colleges or other corporate bodies. Nevertheless, the College of Surgeons of England, and the Society of Apothecaries of London, still require the students to register at the College and the Hall respectively, thus causing what appears to be an unnecessary waste of time in doing at three places what might and ought to be done only at one. The worst feature of the business is, that the Medical Council seems to have no power of enforcing its own regulations, and thus the Register, which should contain a list of all the Medical Students of Great Britain and Ireland, is quite imperfect. It must also be added that while the Registration at the College and Hall in London is efficiently performed, that at the office of the Medical Council is necessarily inefficient, not from the want of zeal or activity on the part of the subordinate officers, but from their inadequate payment and the onerous nature of their duties. The amiable and estimable Registrar has probably other matters to attend to than to give daily and hourly attendance at the office, and his duties devolve upon the two gentlemen who have long and ably discharged the routine functions of his post, but on whom the extra duties of the registration of students are somewhat unfairly super-imposed, especially as no increase of salary has been awarded to them.

EARTH-CLOSETS V. WATER-CLOSETS.

THE proposal recently made by Dr. Thos. Hawksley to substitute earth-closets for water-closets in such a city as London was sure to provoke both opposition and ridicule. Accordingly, we are not surprised at the amount of correspondence on the subject that has been admitted to the columns of the daily papers at this dull season of the year. The invention of the Rev. Mr. Moule, by which dry earth is substituted for water, has been found to serve admirably in country districts, and is likely to be sufficiently profitable to secure extensive application.

But the idea of adopting a similar method in large cities is at first quite startling. Dr. Hawksley proposes a relay of metal pails: the contractor to take away the full and leave empty ones every morning. We do not hesitate to call this system impracticable. Apart from the engineering difficulty of bringing into London 400 acres of land and taking it away into the country again, a difficulty of which, perhaps, too much has been made, we feel that the method could not be carried out in an inoffensive manner. It would be necessary, for instance, to provide other means for the disposal of the fluids. Now, with a large experience of London servants we venture to assert that they would never obey instructions on this point. Besides which, the amount of soil they would constantly contrive to spill would become a terrible nuisance. One of the greatest difficulties in large town-houses is to get servants to keep the dust-bin constantly emptied, and to persuade them not to make it the receptacle of animal and vegetable refuse. Now, under a system which would, in effect, be the storing of fæces in a dust-pail for twenty-four hours, we should look for a tenfold aggravation of the carelessness and filth of domestic servants. They would never understand the principles of disinfection, nor would they believe that the slops might not be added to the solids, nor that dry manure was less offensive than wet. We think, therefore, that our present arrangements are preferable to Dr. Hawksley's plan.

SOCIAL SCIENCE CONGRESS.

IN our last number, printed as it was during the sitting of the Congress, we could only report some of the most striking passages of the opening addresses. Of the numerous able papers read, and discussions thereby elicited, we can now only give abstracts of a few of the most important:—

Lord BROUGHAM, after the eulogies on deceased members, reported in our last, and other introductory observations, reminded the meeting that the report of the commission for inquiry into the great subject of capital punishment had been printed, that it is most important from the great body of information it contains, both on this and other countries, that it offered an almost solitary exception to the blank of the late session, for the material recommendation of the report against public executions has been adopted by Parliament after a somewhat warm opposition in the upper house. He referred to defects in the law of evidence which still remain not only without remedy, but without any real defence: the exclusion of parties in cases before the Divorce Court and other courts, who know most of the facts. This no longer exists in civil suits, but in criminal cases we still shut out one party while he hear the other. The consequences, he said, of excluding the accused party had often been shown, and petitions to Parliament strongly expressed them. A person is charged with an offence, when he could at once explain all the circumstances, and show his entire innocence, and that the whole prosecution is a malicious proceeding, but his mouth is shut while his accuser is heard. The French course of proceeding in this respect is to be carefully avoided; indeed, it was always proposed that with us the examination of the person accused, should only be taken upon his voluntarily tendering himself, and being willing to undergo the sifting of a cross-examination. Another deficiency of the late session was, the not passing an act to amend the optional clause in the County Courts Act. The importance of the jurisdiction of these courts has long been admitted. The number of suits they determine is prodigious. The optional clause requires the previous consent of both parties, and, as the one would refuse what the other proposed, merely because he proposed it, the clause has had very little effect, if any, in extending the jurisdiction to other cases in kind and in amount; whereas if the suitor could begin for a larger amount, and for other objects it is certain, that the great facilities afforded by the local courts would induce the defendant to acquiesce, and a very material increase is thus withheld from that most valuable jurisdiction by the delay to make this obvious improvement. But, though the last session has been lamentably unfruitful of measures, he observed, the Commons have issued important commissions for inquiry into the scandalous scenes of corruption which too many of the late elections have displayed. He said that no question could be raised, although we see it attempted, as to the gross criminality of the parties, both the candidates and their agents, and the voters; nor is there the least common sense in the allegation, that the voters cannot be made to regard selling a trust, which a vote is, for money, as criminal. They must be made to regard it as such by the infliction of severe punishment; the candidates and their agents must also be punished. It is certain that bribery can only be stopped by sending those who give and those who receive bribes to the treadmill like other offenders. He then referred to the late improvement in our county and borough gaols, and attributed the greater part, if not the whole, of the diminution of crime during the last half-year. He thought the result of this act should encourage the Legislature to pass other useful laws; and spoke of a plan suggested by the great Duke and himself for facilitating the private bill business in Parliament, which in its exhausting and harassing effect upon the members now interferes so much with public measures. His Lordship proceeded to remark that the friends of social science have reason to congratulate the public on the great achievement of the conductors of the Atlantic cable. They have finally succeeded, after the failure of last year, in this extraordinary and most important undertaking, and the Atlantic no longer offers an obstacle to direct and instantaneous communication with the Western world, and in a few hours accounts can come from New York to London and Paris. Then he spoke of the evils of intemperance, and remarked that one sees with astonishment and indignation,

in cases before magistrates, intoxication urged in extenuation of offences, whereas it is a gross aggravation. No magistrate is entitled to suffer one such word to be uttered before him on the part of the accused. Any magistrate is bound to stop the party or his advocate the instant he begins this, and to tell him—that if intoxicated he must suffer a punishment more severe. It is undeniable that a most wholesome effect would be produced by the general impression being made that drunkenness, though by law it may not be liable to punishment, except by small pecuniary penalty, yet makes offences to which it has given rise more severely punishable. He concluded his address by a reference to the progress of co-operation, which is shown by the great increase of business. The traders have joined in giving those under them the incalculable benefits of reduced hours of work; and in the great towns, as well as in London, the half-time rule seems established on Saturdays, to the great benefit of the men both physically and morally. Co-operation, he says, is due to the people—not to the Government or the Legislature. So are the institutions founded and conducted by private individuals though licensed by Government. He referred to the Refuge of Female Convicts, the Carlisle Refuge in Ireland, the proceedings under Lady G. Fullerton for the Roman Catholics, and for the Protestants under Miss Twining, both which are highly approved by that great philanthropist, our much respected colleague, Commissioner Hill. If, he says, in bringing his remarks to a close, so great have been the disappointments at home, have we anything to console us when we turn our eyes abroad? We cannot, he says, pronounce anything with certainty on the state of the Continent as to what may be the distribution of dominion or the continuance of peace. He glances at the principal European powers, and thinks there is no doubt that the cause of progress is in a hopeful condition—that there is a general tendency towards free institutions—that the Protestant interest has gained considerably. In France, he says, there is so strong an opposition to the Imperial Government, and so general a desire of material prosperity, that there seems good ground for a belief in greater freedom of discussion being given to public bodies, and even in some relaxation of the laws respecting the press also. Great sacrifices have been made for the termination of hostilities. The Emperor's conduct to prevent their continuance has been highly meritorious, and at length a general peace is concluded. Yes, peace is restored on the Continent, and all friends of social science must heartily rejoice.

Shortly after the conclusion of his Lordship's address the Sections commenced their meetings. The subject in Section C was "Repression of Crime." Mr. R. C. Hanbury, M.P., read an address. The particular question discussed was—"Is it desirable to carry out life sentences to the utmost, and, if so, in what cases and under what forms of discipline?"

Mr. M. D. HILL read a special paper on the subject, of which the following is the substance:—

"Capital punishment, though retained in our criminal code, will probably be reserved for culprits convicted of deliberate murder. If so, the convicts to whom imprisonment for life will be applicable may be ranged in two classes—1. Such as, by ferocity of disposition, or in gusts of uncontrolled passion, have inflicted death, or serious, permanent, and irremediable injury on the objects of their attack; and in this class will be included convicts guilty of murder in the highest degree, if reprieved by the Crown. 2. Convicts whom repeated convictions after punishment for felony—or grave misdemeanours like perjury, the obtaining money or goods on false pretences, or the wilful uttering of base coin—show to be incorrigible. The protection of the public demands that convicts condemned to imprisonment for life should be sent to a gaol specially erected to receive them, from which escape should be made absolutely impossible, and from which discharge should be made so difficult that it could rarely occur. Thus I contemplate that the vast majority of convicts sentenced to perpetual imprisonment will change their gaol only for their grave. Such an inexorable fate, when it became known, would have, I believe, all the deterrent effect which punishment is competent to produce; unless, indeed, the treatment of the prisoner were made such as to excite the envy of poor labourers at large. For myself I do not think this a very probable event, even if we were to recur, as we never shall do, to the false indulgence now happily eradicated from our prison discipline. Confinement

to one spot, with more or less of isolation, with severe restrictions upon correspondence, and exclusion from knowledge of what is passing in the world beyond the walls, would be, in all ranks of life, save to persons very exceptionally constituted, felt to be a hardship all but intolerable. But when to these privations you add abstinence from alcoholic beverages of every kind, and from tobacco, you present a state of things to the minds of those likely to yield to the temptations which consign men to prison nearly as repulsive as can well be imagined. Indeed, such a regimen, when combined with long hours of labour, plank beds, and no more time for sleep than nature requires, would form a system of treatment so depressing to the mind of the criminal that, if he were rendered hopeless of mitigating its severity by good conduct, appalling consequences might be expected. His life might be shortened by despair, even if he were not driven to suicide. We are thus forced upon a problem not easy to solve—viz., how to inspire the criminal with hope, without, by the relaxation of this object of harsh discipline, leading those who might be tempted to follow his example in crime to underrate the misery of his lot. When the prisoner knows that his confinement must come to an end, either because his term of imprisonment will expire or because he is in course of working himself out of prison by industry and good conduct, the danger of reducing him to despair is obviously lessened; and, with prisoners of ordinary temperament, unless the expected return to liberty is placed at too great a distance, such danger calls for no special attention. But in cases of imprisonment for life, in which the number of discharges is insignificant, the hope of return to society cannot have a practical operation. Our expedients for exciting hope are limited, therefore, to affording the criminal opportunities of bettering his condition in the gaol itself. And, for the reasons to which I have adverted, even that amelioration must be slow in progress, and must lead to nothing which persons at large would not consider a miserable state of life. As he is not to ascend to any great height, and yet, as it is important that his rise, though slow, should be, unless from his own fault, continuous (or, at least, stationary only for short intervals), it is evident that at the commencement of his incarceration, he must be placed in a very low condition indeed. The class of prisoners who have deprived a fellow-creature of life, or diminished its comfort and enjoyment by the infliction of grave personal injury, should, I think, for a period more or less considerable, be placed in irons, heavy at first, as heavy, indeed, as nature can support; yet to be promptly lightened by good conduct until, at last, they are reduced to one ring, and even that one may eventually be withdrawn. This infliction of irons to be superadded to all the visitations undergone by convicts in penal servitude, which visitations may be also multiplied and increased in severity in the earlier stages. To these earlier stages the prisoner is to be sent back in cases of misconduct, and then left to work himself up again. Although, as I have shown, when the prisoner is shut out from all but the mere possibility of regaining his liberty, the means of inspiring him with hope are reduced to narrow limits, yet it must not be forgotten that some facilities for appropriate treatment of prisoners for life arise out of the very absence of all necessity for so training the convict in prison as to endow him (when that is possible) with such a capacity for self-government as shall enable him to maintain a self-supporting position on his return to society. When such a return is to be provided for, it is found essential to success that it should be kept in view from a very early stage of the punishment. No fair opportunity must be lost of giving the convict some power over his own actions, beginning with very slight relaxations of control, but approaching by the time of his discharge to a state differing comparatively little from that which he will enjoy when he finds himself on the outside of the prison gates, with his ticket-of-leave in his hand. As regards prisoners for life, however, relaxations from strict and minute control need not begin until a later period, and should never extend so far as to place the criminal in a position similar to that which Sir Walter Crofton calls his "intermediate stage" in penal servitude. On the other hand, as it is not essential that he should form such habits of industry as will enable him to hold his place in the struggle undergone by a free labourer, indulgence may, after a term of years, be afforded by a diminution of his hours of toil. I scarcely need say that care must be taken to make all prisoners for life not only acquainted with the rules by which,

if they persevere in industry and good conduct, they will gradually mitigate for themselves the hardships of their lot, but they must also be enabled to see that such of their fellow-convicts as have earned the indulgences to which I have referred are in the full enjoyment of them. As to the second class of prisoners for life—viz., incorrigible offenders against the rights of property, they ought not, I think, to be subjected to the hardship and degradation of irons, but in all other respects I would recommend that the differences of treatment between them and the prisoners of the first class should be but slight.

Sir W. CROFTON, C.B., remarked that the system of sending convicts to Western Australia would soon be brought to an end; and therefore the question for discussion was opportune. Consideration would soon have to be given to the revision of the treatment of our life sentences. What stared us in the face now, was the fact that for the future we should have to detain our life-sentenced convicts at home, and it should be insisted, at any rate, that the liberation of such criminals should henceforth be the exception instead of the rule.

He referred to the opinions of Captain Knight, Miss Carpenter, Mr. Neate, M.P., and Colonel Henderson, on this subject, and stated the conclusions at which he (Sir W. Crofton) had arrived. They were as follows:—

First, that from information received from the Continent, and from experience obtained in Ireland, it appears to be quite possible to detain convicts under life sentences for indefinite periods, and as the time is now arrived when we can no longer send this class of persons to Western Australia, it is most opportune their special treatment should receive immediate consideration. Secondly, that in the opinion of those practically acquainted with the subject it is necessary that prisoners so sentenced should be detained in special prisons, because as long as they are in ordinary prisons they will consider themselves as certain to receive their liberty, whereas it is most important that the criminal should feel, and that the public should know, that henceforth liberty will no longer be the rule, but quite the exception, that such punishments should be inflicted as banishments for life, because with the hope of liberty thus cut off it would be, in the opinion of practical persons, extremely difficult, if not quite impossible, to preserve discipline in the ordinary convict prisons, because with so strong a stimulus as hope of liberty being cut off it will be necessary to preserve a distinct treatment. Thirdly, if possible, both for the effect upon the public mind and other reasons, it is desirable that punishments for life should be carried out in some island near our own coasts. Fourthly, there is no special reason to believe from the experience that has been afforded by recent improvements in prison discipline that a special system of treatment should be devised, which under firm but humane administration would, while preserving the motive power to exertion and hope of amelioration of condition under detention, be unable altogether to dispense with the stimulus so fatal to society, as holding out to such grave offenders any prospect of their liberation. He hoped some resolutions would be passed to this effect.

Mr. CHAMBERS, M.P. (Common Serjeant of London), said he had listened to the proposals that had been made with intense pain, and his objections to the entire suggestions were so numerous that he hardly knew where to begin. The plan which had been submitted proceeded upon tacit assumptions of various kinds that were not proved, and that might or might not be true. It could not be denied that the whole object of that plan had been to bring us up to a state in which we should inflict more cruel punishments than we already inflicted (no). He repeated the assertion. A life sentence which was to be carried out as a life sentence, and in which the element of hope, if not altogether eliminated, was so feeble that it would have no practical effect, was assuredly a more cruel one than any we had had hitherto in operation in this country (hear). He was greatly afraid from the tone of the public press, and from the tone so far of the present discussion, that we were accustoming ourselves—the most humane among us—to quiet anticipation of a state of things in England which we had read of in history and had mourned over. It might be that it was actually necessary to keep prisoners in gaol all their lives without hope of remission, but there was no ground really to assume that the state of crime in this country was an absolute disgrace to us in the civilized world. He did not believe that there was an atom of truth in the assumption.

The discussion was carried on by the following gentlemen:—Lord R. Montague, Major Cartwright, Sir E. Wilmot, Dr. Mary Walker (of New York); Rt. Hon. J. Napier, Lord Teignmouth, and others; and after a lengthened debate, two resolutions were unanimously adopted. The first, recognizing that the treatment of life-prisoners should be revised, and urging that steps be taken to insure liberation being the exception, and not as heretofore the rule; the second, declaring it to be absolutely necessary to institute a separate prison for life-sentenced convicts, where a special treatment could be carried out.

WHAT IS THE DUTY OF THE MOTHER COUNTRY AS REGARDS THE PROTECTION OF INFERIOR RACES IN HER COLONIES AND DEPENDENCIES?

The papers read were by Mr. R. N. Fowler, Mr. C. S. Roundell, and Mr. John Gorrie, the two latter having been prepared by request. Sir V. Surtees presided, in the absence of Mr. Dudley Field. Mr. Fowler's paper was on "The Treatment of Inferior Races by Great Britain" (referring to the gradual extinction taking place in the Hudson's Bay Territory of the Indian aborigines, the British possessions in South Africa, and the Maories in New Zealand). He concluded by saying that England had not shone in her treatment of subject races, and that the Emperor of the French, in his wise and just protection of the Arabs of Algeria, had set us an honourable example which it was to our disgrace we had not imitated. It was well worthy this Association's inquiry if something could not be done to secure the rights and privileges of the natives of our different colonies. Their lands should be respected, and, when required for colonization, acquired by purchase or on fair terms, proper officers should be appointed to look after their interests and to protect them in the enjoyment of their rights. Above all, every facility should be given to those devoted men who strove to bring them to the paths of Christianity and civilization. In reference to the Hudson's Bay Company's territories, it was suggested that the charter should be withdrawn, and the aborigines placed under the protection of Canada.

Mr. ROUNDELL read a very able paper. The portion of it directed to the condemnation of recent events in Jamaica, called forth applause; and his inquiry into the question how far the negro is capable of civilization was listened to with much interest.

THE PREVENTION OF INFANTICIDE.

The discussion was opened by Dr. Lankester, Coroner for the Central District of Middlesex, who stated that he would confine his remarks to the murder of children newly-born, though the murder of children who had lived for a few weeks or months, or even for a year, was not uncommon. In 1863 he had held 84 inquests on newly-born children; in 1864, 100; and in 1865, 114. That included all cases of death, whether caused by natural causes or otherwise. In 1863, however, 53 verdicts of wilful murder were returned in such cases; in 1864, 56 verdicts; and in 1865, 61 verdicts. Thus, in three years, in his district alone, 170 verdicts of wilful murder had been returned. He did not think that 70 was too high a number to fix as the yearly number of cases of wilful murders occurring in Central Middlesex which came under his cognizance. Then came the question whether that included all cases of wilful murder. When it was remembered that the cases that came before the Coroner's Court were only those that had been clumsily put away—thrown into some neighbouring street or pond—it had always appeared to him that a very large number of infants were successfully put away and concealed. It was not improbable that for every body discovered another was successfully concealed. Adopting that calculation he had endeavoured to show to what extent the crime of infanticide prevailed in this country. His figures had been questioned, and he himself abused for his calculations, and he had been quite disgusted with a paragraph which never ought to have appeared in a respectable paper, entitled "Coroner's Arithmetic" (hear, hear). His figures might, perhaps, be too high or too low, but his theories ought not to be laughed at upon that account (cheers). His calculation was that in England and Wales there could not be fewer than 1,000 cases of infanticide annually. He had no system of prevention to bring forward, but he might be allowed to suggest that the attention of moralists and philanthropists should be drawn to the fearful picture of immorality which that crime brought before them. Young women should be taught

the sinfulness of unchastity, and such a change in the law as would compel fathers more generally to support their illegitimate children, should take place. That would remove one great temptation to infanticide, and would help to save the lives of both mothers and children. And with regard to saving the life of the mother, he thought it could be shown that that was a most important point; for a very large proportion of mothers who had borne those murdered children had lost their lives in the attempt to conceal their shame and crime. He calculated that one mother in six of those who concealed the birth of their infants lost their lives in doing so. In the majority of cases these mothers were domestic servants, sleeping by themselves, and in almost all cases they had no one with them in the hour of nature's peril. Among the remedies proposed one was for the establishment of institutions where women who had been seduced might be taken care of and kept during their confinement. He believed that institutions of that character were capable of doing a certain amount of good, and that they were deserving of support. In conclusion, Dr. Lankester expressed his approval of the conclusions arrived at upon the subject by the Royal Commission on Capital Punishment.

A paper on the same subject by Mr. SAFFORD was next read. It contained a very elaborate statement of the law both in past ages and in the present time upon the subject, and proposed that charitable institutions to receive illegitimate children should be founded, and empowered to compel both parents to contribute to their support.

Mr. ASPLAND and Mr. BRACEBRIDGE addressed the section upon the subject of Dr. Lankester's paper, and in doing so referred in complimentary terms to the labours of its author.

Sir EARDLEY WILMOT agreed that Dr. Lankester deserved the highest credit for the time and attention which he had paid to that question. He did not, however, agree with all the conclusions arrived at by him, and especially with his estimate that for every child whose murder had been discovered, another had been successfully concealed. His own opinion was that they should consider whether the time had not arrived when, considering the state of society and of law reform, they should make the crime of seduction—for it was a most heinous crime—subject to legal procedure, and the offender liable to the penalties of misdemeanour (loud applause).

Dr. MARY WALKER, of New York, a female physician of eleven years' experience, thought that one great cause of infanticide was that virtuous women did not sympathize sufficiently with their fallen sisters. Instead of debarring women who had sinned from honourable society, the men who had caused them to sin should be shut out from the company of virtuous and respectable women (applause).

The Rev. HENRY SOLLY suggested that where a man and woman came together the act should be considered as equivalent to marriage, and if the man were married previously he should be prosecuted for bigamy. At present, in the eye of the law, it was the consummation of the marriage, and not the performance of a mere ceremony before the clergyman or registrar, that constituted marriage.

Miss Gough, the Rev. W. Kaye, and other persons continued the discussion.

Mr. T. CHAMBERS, M.P., thought that the proposal of Mr. Solly would cause the greatest incentive to sin that they could possibly conceive. No boy at home from Eton or Harrow but would be liable to become the victim of some wicked and designing woman (applause). His own opinion was that the woman should be taught that as society was at present constituted all the shame and suffering would have to be borne by herself. He advocated the adoption of more stringent measures in law for the punishment of infanticide.

Dr. LANKESTER, in replying on the discussion, said that he had traced the crime of infanticide to domestic servants. It was in those districts of London where the largest number of servants were kept that the greatest number of child murders were committed; and he thought that the cause was to a great extent the distance maintained in families between mistresses and servants. He appealed to the women of England to cleanse their own households of this great crime, and they could do so by maintaining that superintendence of one woman over another by which the crime could be most effectually prevented. It had been proved that when the condition of a woman was once known she never murdered her child.

THE POLLUTION OF RIVERS.

A special question for discussion in the Health Department was, "How can the pollution of rivers by the refuse and sewage of towns be best prevented?"

Dr. STEVENSON MACADAM, of Edinburgh, read a paper which he had prepared on the subject by request of the Council. He stated, that although the observations he would make would be of a general nature, the opinions he expressed were derived mainly from observation made on three Scotch rivers—the Leven, contaminated by public works; the Water of Leith, contaminated by public works at the upper parts, and by town sewage at the lower parts; and the North Esk, influenced by discharges from public works and by sewage alternately. The pollution was principally derived from mining pursuits, manufacturing operations, and house sewage; and the great question to be considered was how the pollution could be prevented. Irrespective of the question of the health of the neighbourhood, there was the appearance of the stream itself. A good deal was said on the previous day as to the influence of smoke on the atmosphere and on the animal spirits of people, and he believed the appearance of a stream had similar results. He did not see how mining operations could be withdrawn, but they were not of so much importance. With regard to manufacturing discharges, he would say generally, that all practical means for the arrestment of the pollution should be employed. It was a question how far some rivers should be given up for manufacturing interests, it always being a condition that the operations and discharges should not be prejudicial to the health of the neighbourhood. In regard to the utilization of sewage, Dr. Macadam contended that the most successful system was that of irrigation, and detailed the manner in which this had been employed at the Craigentenny meadows, near Edinburgh, where even in a monetary point of view, it had prospered. Whether, however, the system paid or not, irrigation ought to be compulsory in all inland towns. As to seaboard towns, the discharges ought at once to be drained into the sea. With respect to the disposal of the sewage, he believed that local authorities generally were anxious to promote the welfare of the people (hear, hear), but they required direction. They were frequently hindered in their good work by the constituency they represented, and they required to be nerved to action by the pressure of a superior authority. The sewage question would be best worked by a local authority controlled by a Royal Commission or Government Inspector. His decided opinion was that sanitary measures should be compulsory and not optional (applause). In discussing this question he had refrained from any remarks respecting the state of the Medlock, the Irk, and the Irwell, but these streams did not appear to him to be pure water (laughter and applause). He would leave the application of the question to Manchester to be dealt with by those who were more conversant with the district.

Papers on the same subject were read by Mr. John Newton, C.E., who strongly advocated the irrigation system; by Dr. Thomas Hawsley, who proposed to make it illegal to discharge any offensive matter into our sewers, and to substitute earth-closets for water-closets in all houses; and by Mr. S. Clement Trapp, C.E., who expressed himself decidedly opposed to water-closets, unless in connection with irrigation.

The discussion was commenced by Lord Robert Montague, who contended that the question under consideration lay at the root of the whole matter of sanitary reform. There was no Act of Parliament, no legislation which deserved the name of sanitary legislation unless it provided for the purification of rivers. We had as much a common right to pure water as we had to pure air, and he believed that impure water did much more injury to the constitution than impure air. In most mines not only was it easy, but it was a source of gain, to separate the polluting source of the water before it was turned into the river. In manufactures, it was equally easy to prevent a pollution of rivers. If this were not the case, the difficulty would have been rather a staggering one, as anything that would interfere with the vast productions of such a place as Manchester should be deeply considered before it was undertaken; but even in that case the lives of men were of more value than all the wealth of Manchester (hear, hear). But even in the most difficult manufactures, such as gas-works, bleach-works, and paper-works, it would be a source of gain and not of injury to the manufacturer to be compelled any longer to pollute rivers. Dr. Macadam had pro-

posed that some rivers should be given over to the manufacturer, but he could not conceive that such partial legislation would for a moment be listened to. As to the question of sewage, he believed that there was only one means of freeing rivers from that pollution. Various schemes had been tried. The sewage had been sent into the air, but that did not do; water had been tried, but it did not succeed; land must now be tried, and that he felt certain would do. (Applause). In regard to Mr. Hawsley's plan for earth-closets, he wanted to know where the earth would come from? (Hear, hear.) Mr. Bateman, the eminent engineer, had calculated that it would require to supply London with the necessary earth for these earth-closets every year 400 acres of ground six feet deep. Where was that amount of soil to be got? (Hear, hear.) He thought that was a "stumper" to the whole plan. His lordship concluded by moving that it be an instruction to the council, "That, while it is necessary to remove as speedily as possible excreta and refuse from houses, it is advisable to procure compulsory legislation against the pollution of rivers by refuse or the sewage of towns." (Applause.)

Mr. RAWLINSON remarked that, although it was well known that rivers were now polluted to a fearful extent, there were some things attributed to that pollution which it was just as well to clear away. All the ills that flesh is heir to were said to spring from this pollution, but, although a foul river was an intolerable nuisance, yet it must be remembered that it was an advance in civilization (hear, hear), and that we must start from the point that had been reached and advance farther. When the rivers were pure in this country there were no sanitary regulations in our towns, and the plague, sweating sickness, and black death prevailed. Sanitary improvement had swept away that type of disease. Now we had cholera, typhus, and other forms of fever, but it was unfair to contend that the pollution of rivers created these diseases. The discharge of effete matter into running water was a very great improvement on the ash-midden and the cesspool crowded in upon the cottage (hear). Manchester had been searched by men competent to arrive at a correct conclusion with the view of ascertaining whether the most severe types of disease affecting the health of the population could be attributed to foul rivers, and they were bound to come to a contrary conclusion. Although rivers were very foul, they did not work all those evils that were laid to their charge. In 1859, when the Thames was so foul that Parliament sat with closed windows, the Registrar-General knew that the rate of mortality was small (hear). He was happy to find that some of the manufacturers of Yorkshire were, without compulsion, doing many things to perfect their sanitary arrangements. The washings of wool, which used to pollute rivers in the most obnoxious form, could be so treated as to take out the soap soils and to make the water by no means injurious. When in Leeds lately he was surprised to find—and the Section, no doubt, would be surprised to hear—that the town was not only the great centre of the cloth trade, but that the tan trade was larger in Leeds than in any other town in the empire, no fewer than 2,700,000 hides being tanned in the course of the year. He was glad to say that some of the principal tanners in Leeds were beginning to utilize the pollution arising from the tanning process, and were finding it to succeed remarkably well. The Royal Commission to inquire into the pollution of rivers, of which he was a member, commenced their labours on the 15th of this month. He could only say that the subject would have his best and closest attention. The result of their report when laid before Parliament would come under the attention of such gentlemen as he saw before him—the members for Manchester and Carlisle; and he sincerely hoped that the question would receive some practical solution. They might rest perfectly satisfied that Parliament would not enact any compulsory measure which should destroy trade or which should be burdensome or injurious to the community, but that they would carry such a measure as should be for the benefit of the whole people, and, if possible, to the injury of none (loud applause).

Dr. ELLIOT, of Carlisle, seconded the resolution proposed by Lord Robert Montague, which, after some further discussion, was adopted.

DWELLINGS FOR THE WORKING CLASSES.

In Section A of the Department of Economy and Trade (presided over by Mr. E. Potter, M.P., and Sir James Kay Shuttleworth), a special question was raised as to what

measures, legislative and other, should be adopted in order to supply better dwellings for the working classes. On this subject various papers were read, including one by Mr. Barron Emmanuel, and one by Mr. T. Worthington. The former gentleman, in addressing himself to the practical part of the question, proposed to convert the existing railway arches into workmen's dwellings, whenever the process could be conveniently carried out, and he further suggested that in future railway Acts such a construction of viaducts should be necessitated as would admit of their being used for the like purpose. He was quite sure that such a provision as this would pay a large percentage to the railway companies who might think proper to embark in the investment. Mr. WORTHINGTON, in his paper, passed in review the various efforts which have been made, from time to time, by individuals and by societies for the erection of model dwellings or the renovation of existing property. In treating of those efforts, he alluded especially to what had been done in the metropolis, in Yorkshire, and in France; and the conclusion he arrived at was, that the proper course to be adopted was to incite the working men to combined efforts (under the Act of Parliament introduced last session by Mr. Torrens, M.P. for Finsbury), aided by loans from the Public Loan Commissioners, to erect dwellings for themselves.

In the course of the discussions which afterwards took place on these papers and those of Miss Octavia Hill and Mr. Thomas Beggs,

Mr. TORRENS, M.P., made some observations in explanation and support of his bill. He stated that it was not necessary for him to plead the cause of that bill as if it were a new bill; but he was there to defend the measure in its essential principles. In reference to the measure which had been brought forward by this association, he took the opportunity of stating that the promoters of his bill were not wedded to any particular forms or modes of carrying out the desired object. All they desired was that the Legislature should do the best they could under all the circumstances. If any man or any society had a better or more comprehensive scheme than his own, let it by all means be produced, and he would support it to the utmost of his power. The objection he took to the bill of the society was that it left the people, whom it was intended to serve, to voluntary speculation. He did not wish to disparage enterprise or benevolence, but he and his supporters contended that the proper system to be adopted was a compulsory, not a voluntary one. His bill would compel all local authorities to hold themselves responsible for the existence of fever nests, and for the omission to pull down decayed tenements and rebuild them, with the aid of such powers as the Legislature would be enabled to bestow.

Mr. E. CHADWICK and Sir CHRISTOPHER RAWLINSON addressed themselves more particularly to the commercial part of the question, the former contending that a great deal of the cost of modern dwellings owed itself to the fixed building regulations, and to the settled habits of architects in the formation of their designs. He was fully assured that by the adoption of an improved mode of construction, such buildings as those which had been erected by Alderman Waterlow would yield a profit amounting to 7 per cent. instead of 5 per cent.

CONVOCATION OF THE QUEEN'S UNIVERSITY.

A MEETING of Convocation of the Queen's University in Ireland was held on Friday last in Dublin Castle, to elect a member to the Senate, to discuss the Supplemental Charter and other subjects, and to declare their opinions thereon.

The following members of the Senate attended:—

Right Hon. Maziere Brady, Vice-Chancellor, who presided; Chief Justice Monahan, Chief Baron Pigot, Right Hon. Justice O'Hagan, Sir Robert Kane, President, Cork College; Rev. Dr. Henry, President, Belfast College; Edward Berwick, President, Galway College; Sir Dominic J. Corrigan, Bart., M.D.; Professor Sullivan, Catholic University.

There was a large attendance of professors and graduates, including—R. Adams, M.D.; Dr. Seeds, Professor Barr, Q.C.C.; Professor D'Arcy Thompson, Galway; Professor King, do.; Professor Rowney, do.; Dr. Burke,

Lord James Butler, Professor Stevelly, LL.D.; Professor Curtis, LL.D.; Professor M'Cosh, LL.D.; Professor Redfern, Queen's College, Galway; Professor Rushton, M.A.; Professor Clelland, M.D.; Professors Bensbach, M.D.; Brown, M.D.; Allman, LL.D.; Harkness, F.R.S.; Bayley, M.A.; Romer, M.A.; Meisner, Ph.D.; Wyville Thompson, LL.D.; James Thompson, C.E.; Ryall, LL.D.; Vice-President, Q.C.C.; Andrews, M.D., Vice-President, Q.C.B.; Mills, M.A.; James Nelson, M.A.; Dr. Edward Mapother, Daniel Ross, M.A.; John M'Lean, barrister; Professor Jack, M.A.; Rev. J. P. Reichell, D.D.; William Lupton, M.A. barrister; Andrew Cummins, M.A.; Professor MacDonald, LL.D.; Professor Moffatt, LL.D.; Professor Nesbitt, M.A.; Professor Campion, M.A.; Professor Barry, M.A.; J. Johnstone Stoney, M.A., F.R.S.

The Vice-Chancellor said that this was the first meeting of Convocation assembled under the provisions of the Queen's Charter to the University, granted in the twenty-eighth year of her reign. He would just very briefly, from that document, mention what the powers of the body he saw assembled around him were. That charter provided that the Convocation should consist of certain persons—the Chancellor, Vice-Chancellor, senators, registrar, graduates for the time being, and graduates of two years' standing. The Senate, under the provisions of the 23rd section of that charter, appointed that day for the meeting, and had obtained permission to assemble in that hall. The Convocation was now convened for the purpose, as far as the Legislature required them, of carrying out different matters they were empowered to deal with under that charter. The first and most important matter to be disposed of would be the filling up of the vacancy made in the number of the Senate by the decease of the late Lord Monteagle. Having said that the Convocation had power to elect a senator, he should mention, in the original charter that was the only power which Convocation was authorized to exercise without the special warrant of her Majesty under her hand. The other matters, and the most important ones, were not to be dealt with by the Convocation without her Majesty's special leave. This restriction was contained in the 23rd section of the charter—"That no meeting shall be held unless for the election of members of the Senate, unless under the sign manual of the Queen." His Excellency the Lord Lieutenant applied to her Majesty for permission to allow the Convocation to fulfil this other part of its functions, and accordingly her Majesty's letter had been sent, under which they were competent to deal with the matters which the charter empowered them to take into their consideration. In addition to the election of a senator, the Convocation, as ancillary to the election had certain powers which required no authority from her Majesty, that might be decided on that occasion. It was provided that Convocation should have the power to decide whether in such case the holder of an *ad eundem* or honorary degree should be entitled to vote or become a member of such Convocation. That power of discussion was conferred upon the Convocation, but it meant no more than discussing and declaring an opinion. They could decide no question that might arise, and determine no resolution upon any subject whatsoever. It was open to discuss any proposition to be made within the limits of discussion, and simply to pronounce an opinion. Beyond that the charter conferred no power. He believed he had now mentioned all the matters that might bear upon their assembling. There were other things and matters which would, no doubt, be discussed, but he hoped if any discussion would arise, it would be treated in a way that became an enlightened body, and that there would be no acrimonious feeling or language which might be calculated to give offence. There was one intention that should animate all, and that was not only for the benefit of the University, but for the general benefit of education in this country (applause).

Mr. Stoney read the Royal Warrant calling the Convocation, of which the following is an extract:—

"And, whereas, it has been represented to us that it is expedient to enable Convocation to discuss forthwith certain questions relating to the said University, and to disclose opinion of Convocation thereon, our will and pleasure therefore is, that after the 1st day of October, 1866, Convocation shall exercise all the power, and enjoy all the privileges on it by our aforesaid charter without further diminution or postponement; and we hereby accordingly signify by this, our warrant, that after the said 1st day of October meetings of the Convocation of the University may be convened and held for any purpose in our said charter in that behalf mentioned, whereof we herein thought fit to give you this notice, that due attendance be paid to our pleasure herein accordingly, and so we bid you hearty farewell."

ELECTION OF A MEMBER OF THE SENATE.

The Vice-Chancellor said he hoped harmony, good feeling, and good humour, would mark the next business, which was the election of a member of the Senate to fill the vacancy in that body created by the death of Lord Monteagle. First of all they should determine how the voting would be taken, though probably the meeting was large enough to hold it a sufficient representation of the Convocation, they would have to decide whether absent members would be given the opportunity of voting.

Dr. M'Cray, Belfast, said he was aware that several gentlemen came there to make long speeches (laughter). Some might be anxious to hear these speeches, but he and many others would prefer not (laughter). If possible he would like to have the voting first and the speeches afterwards, but as that could not be done he would move that each speaker be limited to five minutes (no, no, and hear, hear).

Dr. Whittaker, Belfast, seconded the resolution.

Dr. Davys proposed as an amendment that each speaker be limited to twelve minutes (laughter).

The Vice-Chancellor observed that if notice had not been given of the motion it could scarcely be entertained.

Dr. M'Cray said he thought Convocation had the power to regulate its order of business.

The Vice-Chancellor said he did not want to throw any obstacle in the way of deciding whether the speeches were to be limited to five minutes or twelve minutes, if gentlemen thought it worth while dividing upon it. He then put the resolution and declared the "noes" had it.

Dr. M'Cray—I ask a poll (oh, and laughter.)

The Vice-Chancellor—You will defeat your own object. It is a matter of taste with gentlemen how long they will occupy in addressing the meeting (hear, hear.)

Mr. Munroe, barrister-at-law, said he had great pleasure in moving that Mr. James Ross be selected as representative of Convocation on the Senate (hear, hear, and applause). He need not conceal from himself that the contest on this occasion would lie between Mr. Ross and Dr. Mapother, and in selecting a person to represent them on the Senate, he thought they should consider the academical standing of the respective candidates.

The Vice-Chancellor said he supposed he might presume it was not proposed the votes should be taken by proxy (hear, hear).

Mr. Munroe resumed—He said Mr. Ross had graduated in arts with the highest honours, and he went through a legal training in the University and took the diploma of law. He was selected to assist Dr. Hancock as secretary to the Endowed Schools Commission. Such was the distinction which he obtained in that capacity that he was selected to act as secretary to the Queen's Colleges Commission. He might now, without meaning any disrespect, ask who was Dr. Mapother, Mr. Ross's opponent? Dr. Mapother was a friend of his (Mr. Munroe's), and was, he believed, an honourable, intelligent, and straightforward gentleman (hear, hear)—but who was Dr. Mapother academically speaking? He was, no doubt, an able man in his profession, but he was almost unconnected with the University. He believed that Dr. Mapother had put forward his claims, not on academical grounds, but on the ground that there was not a sufficient medical representa-

tion on the Senate. He was sure that there was no gentlemen present who would wish that that was so, but if there were no higher interests at stake than that of their being a sufficient medical representation on the Senate, he would say, let Dr. Mapother be elected, but there were higher interests at stake (cries of "No, no"). He might be wrong, but the voting would show it. Medical men should not be allowed to deceive themselves. As long as they were represented by such men as Sir Dominic Corrigan and Dr. Adams, their interests were well represented; but the great question involved here was one which would come before them in another form, namely, whether they would approve or disapprove of the new charter. Mr. Munroe concluded by proposing that Mr. Ross be elected to the vacant place on the Senate.

Dr. Cummins seconded the motion, and in doing so advanced Mr. Ross's claims on the University academically, and otherwise, and said that he did not know a more liberal-minded gentleman. Dr. Mapother was, he believed, an estimable gentleman, and at a future day he hoped to see him in the Senate, but he now asked them to send a gentleman who was better qualified to represent them, and one who would be able to speak with an authority that Dr. Mapother could not assume in matters of education and the principles that rule and govern academic institutions (applause).

Dr. O'Flynn then proposed that Dr. E. D. Mapother be elected a member of the Senate of the Queen's University, in the room of the late Lord Monteagle (applause). He said that Dr. Mapother was a distinguished member of the medical profession, and a graduate of the Queen's University in Ireland, and had also been for years intimately connected with the education of the youth of Ireland (applause).

He did not wish to say anything against the claims put forward by Mr. Ross; but he believed that no more competent man could be selected than Dr. Mapother, who had by his scientific writings, established for himself, a reputation all over Europe (hear, hear). He had devoted much of his time in studying all the important scientific subjects of the day, and the result of his labours in that respect alone was a sufficient guarantee of his fitness to represent the graduates of that University (hear, hear.)

After some further observations, Dr. O'Flynn concluded by proposing Dr. E. D. Mapother as a fit and proper person to be elected a Senator of the Queen's University in Ireland.

Mr. Charles Duggan said he felt much pleasure in seconding the nomination of Dr. Mapother. Dr. Mapother's antecedents were not perhaps known in the books or public documents. His honours should be looked for in a different career. Not only was he recognised for his scientific attainments, giving him a world-wide reputation, but he had rendered distinguished services to medical and surgical science in Dublin. With his name was mixed up the question of the Supplemental Charter. With one or two exceptions, he (Mr. Duggan) was the oldest graduate present, and was connected with the national system of education for twelve years as inspector of national schools. He asked the graduates present to support Dr. Mapother and return him to the Senate, for in his hands the interests of mixed education would not suffer.

Mr. O'Donnell proposed that the voting should be adjourned for two months, in order that the vote of every graduate might be taken. For instance, there were many in India and China (laughter, and cries of "question").

A Graduate—Will the votes be confined exclusively to graduates of this University? (cries of divide, divide.)

The Vice-Chancellor—All members of Convocation have the right to vote.

A Graduate—We have sufficient confidence in each other to go to a division without wasting time by recording the names (no, and cries of divide).

It was then decided the members of Convocation should divide, the supporters of Mr. Ross to go to the right, and the supporters of Dr. Mapother to the left.

THE DIVISION.

Messrs. Munroe and Cummins were then appointed tellers for Mr. Ross, and Dr. O'Flynn and Mr. Duggan for Dr. Mapother.

The Vice-Chancellor—The tellers report to me that according to the result of the division the numbers are—

For Mr. Ross	127
„ Dr. Mapother	...	46	(loud cheering).

I therefore declare Mr. Ross to be elected a senator of the University for the three next ensuing years (prolonged applause).

Dr. Davis said it seemed to be the opinion of the vast majority of the graduates of the Queen's University that the professors should abstain from voting on such occasions as the present (cries of hear, and hisses).

The Vice-Chancellor said he could not put a motion to the meeting controlling the powers of any individual.

Dr. O'Flynn asked if a degree of doctor in medicine had been conferred on a gentleman who had never passed any examination and had never gone through any medical course whatever (hear, hear).

The Vice-Chancellor said he could not answer that question.

Dr. O'Flynn—May I ask, is it possible to bring the matter under the notice of the Convocation?

Vice-Chancellor—That is entirely in the discretion of the individual.

Dr. O'Flynn—How is to be done?

Vice-Chancellor—There must be a notice of motion.

THE SUPPLEMENTAL CHARTER.

Sir Robert Kane then rose and said; I believe that notice has been given of the following motion, which I am about to move: "Resolved: That in the opinion of Convocation the acceptance of the Supplemental Charter of 1866 is inexpedient."

Mr. Wilson, Clerk of Convocation, in reply to the Vice-Chancellor, stated that the notice of motion had been served on the 4th October on the Chancellor (Earl of Clarendon), the Vice-Chancellor, and the Secretary of the University.

Sir Robert Kane said that owing to the peculiar position in which the question lay with regard to the University it rendered it incumbent on him to declare his own opinion, and the course which had been taken upon the supplemental charter (hear, hear.) The supplemental charter had been brought forward by the late Government for the purpose of extending the benefits of University education generally to the members of the religious communion to which he had the honour to belong, and had been, he might venture to say, put forward as a measure of that liberal and progressive policy with which, although he had never taken a very prominent part in politics, he had the honour of being identified. He was compelled, however, although most unwillingly, to declare his painful and solemn conviction that the tendency would be to injure education (hear, and applause). He begged leave to explain why it was that he had formed those views. In the first instance, the manner in which that supplemental charter had been brought forward had, he believed, divested it of that authority (applause) which should accompany an act of the Crown and of a responsible Ministry, and bring to the country such a degree of moral weight as would secure its acceptance by all (applause). The supplemental charter proposed to assimilate the system of education to that of the London University. He believed that it would be injurious to education, and that it had been injurious in the case of the London University (hear, hear). Had it not been for the character of the country, and for the firmness of the Senate of the London University, the standard of qualification among the candidates for its degrees would have been considerably lowered, thereby entailing a very serious injury to the cause of education in England (applause). The favourable circumstances of the sister kingdom have enabled the authorities of the London University to with-

stand the immense pressure put on them, to lower the qualification and to maintain the standard. With regard to the relative merits of the College and of the London University system, with respect to the qualifications for degrees, it was only necessary to refer to the very last reports of the London University and see what had been effected by the admission of any candidate into them who presented themselves for degrees with only a limitation of some formal description, and compare that with what had been done under the requirements of that University system which required the system of college education. He found that all the matriculations in the London University—the total number of those who possessed qualifications reached an average of forty-six per cent. of those who applied; and if they compared that with the numbers which the Vice-Chancellor had read out in his admirable address at the meeting the previous day, it would be found that the proportion of admissions into the Queen's University were enormously greater (hear). In the London University there was a difference made in the returns, according to those students who came up from colleges that had been affiliated. Of those 34 per cent. were rejected, while the number of those rejected who came up without that assistance, of college training, amounted to 70 per cent (hear, hear). By the latest official returns of the London University, this profound distinction drawn between the system of indiscriminate admission, as was introduced by Mr. Fortescue in Parliament as the *beau ideal* of the system of the Dublin University, was easily seen. They had 70 per cent. of those who presented themselves for degrees found to be incompetent. Now, what were the results that were indicated at the last meeting of this University for the conferring of degrees? The Vice-Chancellor stated that for the degrees of Doctors of Medicine in this University after the examinations, the sincerity and truthfulness of which he need not observe, of the number of candidates who presented themselves, 82 per cent. obtained their degree. For the first examination in medicine 17 per cent. obtained their degree. Of Masters of Art all those who presented themselves were found suitably qualified, and in Bachelors of Art 90 per cent. were found fit (hear). On the other hand they had a contrast, in the London University, between those students who passed from college establishments, and the students who passed indiscriminately, according to an arrangement of the Government. Similarly he believed it would be found, with regard to the University in Dublin, that there existed, with respect to the admission and rejection for degrees, a profound distinction between the class of students who, residing scattered through the country, presented themselves for the examinations which were held in the University, as possessing qualifications for degrees, and those *bona fide* students, on the other hand, who resided either in Dublin or the College itself, and devoted themselves studiously and assiduously to their studies. Such were the relative positions, with regard to the qualifications, as to the degree of proficiency the students obtained under the one and the other. But the mere advantage of academic association had even a high bearing on the intellectual acquirements. In the system of indiscriminate admission there was a tendency to degenerate that instruction with mere grinding, rendering the training of the students altogether destitute of that discipline which was so valuable at another time of life, after studentship, and he believed he had one of the highest authorities on educational matters in support of that as to the moral and intellectual acquirements in preparing men for the world. The assimilation of that University with the London University in its present form he considered would be a direct injury to the cause of education, and would lead to the thorough and rapid degradation of that University, and to its rejection ultimately by the people of this country. And he believed that the acceptance of the charter by that Convocation, or by the authorities of the University, would be considered very unacceptable indeed (hear).

There was nothing more absolutely necessary than that the provisions of the charter should be so expressed, so that no second opinion could be formed on it. He believed that there could be no doubt as to the meaning of the charter. The late Chief Secretary had declared that the object of the Government was to assimilate this University to the London University, and he based his recommendations on that University acquiring the great privilege of returning a Member of Parliament. This was the very express ground that it was proposed to confer a representation on the London University. No one was more anxious than he to have the University properly represented, but he would be slow to purchase even that on such a great sacrifice as placing that University on the same footing as the London University (applause). Therefore the interpretation he had heard given in that room of the Supplemental Charter, that although formally bringing them to the condition of the London University, it would not be acted on in that spirit, but only so far as regarded the Catholic University and Magee College, Derry, and he would not hesitate to say that when that subject would be brought forward he would warmly advocate the admission of both (hear, hear). His grounds of objection he now repeated, first that the constitution of the London University, as it now stood, was in itself the centre of an education which it would be well for them to avoid; on the other hand, the second interpretation of the charter which attempted to throw open to Roman Catholics the means of obtaining an University degree by a side wind (hear, hear). On those grounds he opposed the passing of the supplemental charter. Sir Robert Kane concluded by moving the resolution, and resumed his seat amid applause.

Mr. Porter, M.A., in seconding the resolution, said—The Queen's University as at present was established with religious equality, and where there was religious equality there was equity. The best proof of this was the great success which had attended it. The question was whether it had so far been a success or a failure. It had been a decided success (hear, hear). He was not now going to trouble them with statistics with which they had sufficiently been dosed, but he would merely refer them to the fact. This country was comparatively small and comparatively poor, yet the Queen's University in Ireland and the united system of education had been an undeniable success, and that success instead of declining had been growing and developing to the present time (hear, hear.) The number of candidates presenting themselves for degrees, according to the returns, were annually increasing. If such were the case, if the system was improving and growing and approved of, why should it be suddenly struck down by a supplemental charter that has no evidence or occasion for intermeddling with it? (hear, hear.) They had enough of charters and enough of changes. If they had been let alone they would have still more fully developed the system. They had had two charters already and they were quite sufficient, and he was further of opinion that there was no occasion for further intermeddling. If the Queen's University became an institution solely for the purpose of conferring degrees upon all comers, he would fain hope that it would continue to be supported. He believed that the high standard of the Queen's University would be lowered, and that the standard of degrees would be lowered (hear, hear). Mr. Porter after some further observations, read a letter from Sir George Grey to the late Lord Lieutenant, on the subject of united education, and concluded by observing that the present system was the best in this country, and he trusted the Convocation would do everything in its power to maintain and uphold that system (applause).

Mr. Peter M'Cauley moved the following amendment to the motion of Sir R. Kane: "That we approve of that portion of the charter which recognises the affiliation of properly organized colleges, but object to the principle of admitting to degrees persons not educated in some such institution." The resolution rejecting the reception of the

supplemental charter had been proposed by Sir R. Kane, a gentleman who stated he was a member of the Catholic Church, but he (Mr. M'Cauley) could not help thinking he was an unworthy member of that church (loud cries of "Retract," and considerable interruption).

The Vice-Chancellor—I won't allow any personal remarks to be made of such a nature.

A Graduate (in an emphatic tone)—I do hope Mr. Vice-Chancellor, you will not allow such personal observations to be made.

Mr. M'Cauley again essayed to speak, and was met with loud cries of "Retract."

The Vice-Chancellor—I must ask you to retract ("Retract").

Mr. M'Cauley—Will you allow me to do so?

Several of the graduates in an imperative tone, demanded a retraction.

Mr. M'Cauley said, if they willed, he would withdraw the expression and say that Sir R. Kane was a worthy member of the Catholic religion, and let the statement go forth to the country that he was such. He professed to be disinterested in bringing forward the resolution, and while he was speaking in reference to the supplemental charter of 1864 he (Mr. M'Cauley) almost believed he was listening to some funeral dirge (oh!) He wanted to convey to the meeting that the supplemental charter of 1864 was subversive of the mixed system of education in Ireland. He (Mr. M'Cauley) contended it was not subversive of the mixed system of education. It was not his principle to confer degrees on all comers, but he contended that degrees should be conferred on all gentlemen who had passed a regular curriculum, and that having passed that curriculum they were entitled to degrees from the Queen's University. The friends of non-sectarian education had not had it all their own way, for from the establishment of the Queen's Colleges they had met with a manly and upright opposition from those who could not agree in the system of the Queen's Colleges. He would not say whether they were right or wrong, but they came forward as a class—as a majority of the population of Ireland, to say they could not in conscience support the Queen's University, but if allowed to be educated by themselves they would be satisfied to take a degree (laughter). He felt much pleasure in proposing the amendment.

Dr. Davys seconded the amendment. He considered it was only just to the rising generation of Ireland to grant the supplemental charter. It was a mistake to suppose that the growth of the University would be nipped by the granting of so small a concession (hear, hear).

"A SCENE."

Mr. R. O'Donnell, Barrister-at-Law, said he rose, as a Protestant, to support the motion of Sir R. Kane. He did so because he conceived the present movement to interfere with the Queen's Colleges was a movement of the clerical party of all sects and denominations (cries of question, and considerable interruption). Who, he asked, were urging on those changes in the system of education in Ireland (question)? Was it not the bigots of the Catholic University and the Magee College?

[Here a scene of considerable confusion and interruption ensued. Some members of the senate and several of the graduates rose, and a continuous cry of "retract" was kept up for several minutes.]

A Graduate—I demand that that gentleman will retract that observation, which is insulting (cries of retract).

Mr. O'Donnell—Was it not the bigots who destroyed the system in Prussia? I ask is it not the bigots here (great interruption and cries of "retract, retract").

The Vice-Chancellor asked to have order preserved. It was almost impossible to control such general observations which grated harshly on some gentlemen's ears and perhaps pleased others.

Mr. O'Donnell again essayed to speak, and read from a document in his hand some reference to education in

Prussia, amidst great interruption, several gentlemen shouting at the top of their voices, "retract."

Dr. O'Flynn—The gentleman is making uncalled for and insulting observations.

Mr. O'Donnell—The King of Prussia—(Cries of "retract").

The Vice-Chancellor—I cannot interfere with general observations.

Dr. O'Flynn and other gentlemen warmly protested against Mr. O'Donnell using such language.

Mr. O'Donnell having persisted in making his statement that it was the attempt of bigots to interfere with the system of education.

Several of the graduates, headed by Dr. O'Flynn and Dr. Mapother, rose in a body and hurriedly left the hall. After they had left,

Mr. O'Donnell continued to say that under influence of a bigoted Prussian King and bigoted clergy a sound system of education had been marred in Prussia.

Sir R. Kane said those observations were utterly irrelevant. It was plain from the gentleman's observations that he knew nothing whatever about education in Prussia. He seemed not to know what he was saying.

Mr. O'Donnell said that observation was insulting.

Mr. O'Donnell again essayed to address the assembly, but was assailed by cries of "divide, divide." He declared that this was stifling discussion, and that they were afraid of the truth. Mr. O'Donnell went on to read an extract which he held in his hand in reference to education in Prussia, in which it was stated that the highest point to be attained by education was submission to clerical influence. Hatred of science was carried to an extreme point, physics were expressly proscribed (cries of "divide, divide").

Several gentlemen here rose, and insisted upon Mr. O'Donnell resuming his seat.

The Vice-Chancellor said he could not stop discussion so long as there was nothing personal in it.

Mr. O'Donnell said the best proof that he could possibly give of the extent of evil which this system had done was the evil which had been done to Prussia. The greatest system of metaphysics had been excluded from the course of the Queen's University by one of their professors (cries of "divide, divide," and interruption). When the system of united education was first introduced into this country they had men the representatives of all churches coming with their scowling bigotry upon it (renewed cries of "divide"). The works of Mill and Huxley were excluded now by the professors (cries of "divide").

Mr. Mills protested against the time of the Convocation being further occupied by Mr. O'Donnell. There were six medical gentlemen who must return to Belfast that evening and they were anxious to give their vote upon the question (cries of "divide").

Mr. O'Donnell—Blame my interrupters for that (interruption).

The Vice-Chancellor said he could not stop any gentleman who was speaking on the subject so long as his expressions were within order.

Professor Barry—Am I to understand by that rule that it is quite in order to call the King of Prussia a bigot (laughter).

The Vice-Chancellor—I don't know anything about the King of Prussia. He is no member of Convocation here (laughter and applause).

Mr. Berwick—I do not think it is right to listen to a gentleman who has not opened his mouth for an instant without insulting one Church or other (turning to Mr. O'Donnell). If you had shame, sir, you would sit down.

Mr. O'Donnell—My interrupters are more ungentlemanly than I am (cries of "sit down," and great interruption).

Dr. M'Crea was understood to say that many of the graduates endorsed Mr. O'Donnell's opinions; but that that gentleman had expressed himself rather too warmly (cries of "divide").

Mr. O'Donnell said he thought it was quite possible he had expressed himself too warmly by the feeling he saw manifested. But his argument was this, that they should not admit into the constitution of this University any one religious party; he did not care what religion, because they were all the same in his opinion (laughter and hear).

Dr. Magrane said that he concurred with the substance of what Mr. O'Donnell had said, and opposed the charter on the same grounds.

The Vice-Chancellor stated that he would put the amendment first.

Mr. Robb asked the chairman could the amendment be passed, inasmuch as the alleged facts in it were not true.

The Vice-Chancellor said that in his speech Sir Robert Kane had alluded to the matters mentioned in the amendment, and were merely, he supposed, presumptive on the interpretation put on them by Sir R. Kane. He then put the amendment, to which only one "aye" responded, and on the original motion being put, it passed unanimously.

The Vice-Chancellor dropped a remark that the members of the Senate had agreed not to take part in the proceedings of that day.

Sir R. Kane said he should set himself right. It was said that it would have been better for the Senate not to interfere in the election of the Senator, but, that with regard to the proceedings upon the charter, every Senator was perfectly at liberty to take whatever course he pleased. He felt that from the part he had taken in the organization of the colleges, and with the most eminent members of the Old Church, that it would not be in accordance with his duty if he shrunk from the position the graduates of the University wished him to take.

Sir Dominic Corrigan then rose and said that he wished to make a remark. His recollection of what occurred at the meeting of the senate was that it was distinctly agreed and understood, though no resolution was arrived at, that no Senator was to take any part in the proceedings, but to attend and hear the opinions of the Convocation expressed, and he was never more surprised than when Sir Robert Kane introduced the subject that day.

The proceedings were then brought to a close.

MEDICAL POOR-LAW INSPECTORSHIP.

We find that in the list given in our last issue of supposed candidates for the office of Poor-law Inspector, the name of an important candidate was omitted—namely, Dr. Morgan D. O'Connell, F.R.C.S., of Kilmallock, in the county Limerick, medical officer of that union workhouse, and of the Kilmallock dispensary district.

If the selection be made, as we think in justice it ought to be made from the ranks of the poor-law medical officers, we think Dr. O'Connell possesses qualifications which cannot fail to point him out as an eligible candidate.

He has discharged the duties of dispensary medical officer in the Kilmallock District under the old and new systems for upwards of twenty-nine years, besides filling the office of workhouse medical officer since the commencement of the poor-law in 1839, and also of medical attendant to the Constabulary Force in that district for the same period.

Dr. O'Connell has written some valuable reports on cholera, famine fever, ophthalmia, and "over-crowding," in reference to his own union, which were always received with approval and thanks by the Chief of the poor-law department.

Previously to his holding dispensary or workhouse appointments, Dr. O'Connell served with distinction in the British Auxiliary Legion in Spain as staff-surgeon, for which service he received from General Sir de Lacy Evans the order of St. Ferdinand for gallant conduct in the field in attending on the wounded, and for meritorious conduct generally; and he has in his possession, from that distinguished officer, and from Dr. Callender, late inspector-general of hospitals in Spain, and several others, the highest testimonials as to his ability and zeal.

Notices to Correspondents.

THE increase of Correspondence with our Editors renders it impossible to communicate with correspondents by private note. In future, except in matters of a private nature, all letters will be replied to in this column.

Cymro.—There is no Professorship of the kind in London, and we believe the office has been abolished in Edinburgh and Dublin. Military Surgery is now systematically taught at the Army Medical School at Netley. As answers to the other questions, we reply collectively that our Journal is published simultaneously in London, Edinburgh, and Dublin, in each of which cities we have an Editorial Staff.

Galwegius.—The Session in Ireland commences on the 1st of November, but if you prefer idleness to study you can postpone your entrance till the 25th.

X.L.—First and third Monday in the month at four.

Studens.—Your leading article is declined. We cannot "go in" for wholesale diploma trading.

Lusus Nature.—The deformity is hardly rare enough to be worth exhibiting, several specimens exist in the Museum of the Royal College of Surgeons.

Sphygmograph.—The instrument is expensive. Both it and Dr. Foster's work can be had of Fannin and Co.

D. R.—Thanks for the information. We depend on our Subscribers for such details as are beyond our own reach.

Editor Richmond Medical Journal.—We shall have pleasure in assisting you. You will receive a private note.

Dr. Nicolls, Longford.—Letter and report next week.

Dr. Wilson.—The cost of the Medical Directory is 8s. 6d. to subscribers, or 10s. 6d. if paid after January 31.

Adolescens.—We cannot give the name of our correspondent.

Scriptor.—The article reads very like nonsense. The Poor-law Commissioners have no such power.

Letters and communications have been received from—Dr. Seaton Reid, Belfast; Dr. Ffolliott, Kilworth (enclosure); Dr. McGusty, Slane (enclosure); Dr. Hornblow, Shipstow-on-Stour; Dr. Foster, Birmingham; Dr. Ogle, London; C. R. C. Tichborne, Esq., Dublin; Dr. Seymour, Carlow, (enclosure); Dr. Russell, Fermoy (enclosure); Dr. Massy, Ravensdale (enclosure); Dr. Cleary, Collon; Dr. Woods, Parsonstown (enclosure); Dr. Leeper, Loughall (enclosure); Dr. Shanley, Strokestown (enclosure); the Medico-Chirurgical Society; Dr. Philips, Mr. R. K. Barker, Mr. Humphreys, Mr. W. Tobin, &c.

We are requested to state that the letter on "Field Hospitals of the Prussian Army," published in a late issue of the MEDICAL PRESS AND CIRCULAR was written by Dr. H. R. Swanzy, who attached his name in full to it.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

LONDON.—BIRTHS.

HILL—On October 4, at 60, George-street, Portman-square, the wife of F. A. Hill, M.R.C.S.E., of a daughter.
ADAMS—On the 6th October, at 1, Ottoman-villas, St. James's-road, Croydon the wife of R. Adams, M.D., of a son.
MOSLEY—On the 1st inst., at Upper Westbourne-terrace, Hyde-park, the wife of B. E. Mosley, M.R.C.S.E., of a son.
BARCLAY—On the 2nd inst., at Bruton-street, Berkeley-square, the wife of Dr. Barclay, of a son.
KEMPSTER—On the 9th inst., at Oak House, Battersea, the wife of W. H. Kempster, M.R.C.S.E., of a son.

MARRIAGES.

COOPER—DAILEY.—On September 29, at St. Matthias, Stoke, Newington, V. M. Cooper, M.R.C.S.E., of Bow, to Emma, third daughter of John Dailey, Esq., of Manchester.

DEATHS.

FREEMAN, J. H., M.R.C.S.E., at 361, Mile-end-road, on October 3, in his 54th year.
MURDOCH, WILLIAM, M.D., Paris (Medical Officer of Health to the Parish of St. Mary, Rotherhithe), on October 9, in his 61st year.

MARRIAGES—PROVINCIAL.

WORTHINGTON—JACKSON.—On the 3rd inst., at Pennybridge, J. V. Worthington, L.R.C.P., L.R.C.S.Ed., &c., of Garston, near Liverpool, to Annie, third daughter of Thomas Jackson, Esq., of Arrad, Lancashire.
ALLEN—WILDMAN.—On the 4th inst., at Holy Ascension Church, Settle, Dr. Bryan H. Allen, of Hastings, to Susanna, eldest daughter of the late John Wildman, Esq., of Settle, Yorkshire.—No cards.
HORNE—CLEVEE.—On Oct. 2, at Chelsey, Berks, E. Horne, M.R.C.S.E., to Maria, second daughter of H. Cleve, Esq., of Greenhill.
DALZEL—VIALL.—At St. John's, Notting-hill, Mr. W. F. B. Dalzel, M.D., Surgeon, Bengal Army, eldest son of Mr. W. J. Dalzel, Esq., late R.A., to Maria P., third daughter of the late Mr. T. Viall, of Calcutta, 10th inst.

DEATHS.

GORDON.—On September 27, at Primrose-hill, Hulme, Manchester, J. C. Gordon, M.R.C.S.E., in his 59th year.
POWER.—On Oct. 5, at Maidstone, James Joseph Power, L.R.C.P.Lond., aged 59.
PRING.—On September 23, F. B. Pring, M.R.C.S.E., of Grassington, Yorkshire, aged 54.
JAMES.—On the 8th ult., Wm. James, M.R.C.S.E., of Newport, Monmouthshire.
AYTON.—On the 30th ult., at Devizes, J. Ayton, M.D.
RADCLIFFE.—On the 1st inst., at Eastbourne, Sussex, Henry John Radcliffe, M.R.C.S.E., aged 57.
KING.—On the 4th inst., at Bishop's-terrace, Bridlington Quay, Id. Margaret, infant daughter of Dr. Kelburne King, of Hull.

IRELAND.—BIRTHS.

FAIR.—On the 5th October, at Arduarna, Oughterard, county Galway, the wife of Campbell Fair, M.R.C.S.E., of a son.
MOORE.—On October 8, at 97, Stephen's-green, Dublin, the wife of Charles Frederick Moore, M.D., F.R.C.S.L., of a daughter.

MARRIAGE.

RAYMOND—RICHARDSON.—October 1, in Dublin, Samuel Stephen Raymond, M.D., J.P., to Mary, widow of Alfred Goodlatte Richardson, Esq., J.P., of Rathbeg, King's County.

DEATH.

MADDEN.—October 10, at Sandycove, at a very advanced age, William Madden, sen., Esq. (of 9, Blackhall-street), Governor of Apothecaries' Hall.

SCOTLAND.—BIRTHS.

MEIKLE.—On September 29, at Loch Head, near Aberdeen, the wife of T. H. Meikle, M.D., of a daughter.

DEATHS.

MACCONECHY.—On October 3, at 20, at Eton-place, Hellhead, Glasgow, James Macconechy, M.D., aged 70.
WALKER.—On September 23, G. Walker, M.D., of Bonington-place, Edinburgh.
WYLLIE.—On the 2nd inst., D. R. Wyllie, L.F.P. & S.Glas., of Montrose-street, Glasgow.

BOOK RECEIVED.

Sanitary Reform. London: Trübner and Co.

Appointments.

LONDON.

HOWELLS, T., M.B., M.R.C.S.E., has been appointed House-Surgeon to the Westminster General Dispensary, Gerard-street, Soho.

PROVINCIAL.

AXFORD, W. H., M.B. Lond., has been appointed Medical Officer to the Bridgewater Infirmary.
COOKSON, A. N., M.R.C.S.E., has been appointed Assistant House-Surgeon to the Stockport Infirmary.
DONKIN, ARTHUR SCOTT, M.D. Edin., M.D. Durham (Dipl.), L.R.C.S. Edin., Lect. on Forensic Med. to the University of Durham Coll. of Med., Newcastle, has been appointed a Physician to the Sunderland Infirmary and Dispensary.
EDWARDS, H. N., M.R.C.S.E., has been appointed House-Surgeon to the Shrewsbury Dispensary, vice H. Fenton, M.R.C.S.E., resigned.
F. MANSER, M.R.C.S.E., has been appointed House-Surgeon to the Tunbridge Wells Infirmary, vice Mr. R. Davy, resigned.
MR. H. J. PRITCHARD has been appointed Assistant to the House-Surgeon of the Huddersfield and Upper Agbrigg Infirmary, vice Mr. Wm. C. Bland, resigned.

SCOTCH.

BROWN, D. DYER, M.A., M.D., has been appointed Assistant-Professor of Materia Medica in the University of Aberdeen.
INNES, J., L.F.P. & S. Glas., has been elected Surgeon to the Blockairn Iron Works, Glasgow, vice Hugh Rae, L.F.P. & S. Glas., deceased.
MCCARRON, J., L.F.P. & S. Glas., has been elected Vice-President of the Glasgow Faculty of Medicine for the ensuing year.
THOMSON, H., M.D., has been elected President of the Glasgow Faculty of Medicine for the ensuing year.
WOLSTON, W. T. P., M.B., late Resident Physician of the University Clinical Wards, Edinburgh Royal Infirmary, has been appointed Resident Medical Officer of the Royal Hospital for Sick Children, Edinburgh, vice Dr. G. Moffatt, now at the Sick Children's Hospital, Manchester.

Vacancies.

ENGLAND.

Darnley Union.—Workhouse; salary £50 per annum.
Skipton Union.—Kettlewell District; area 29,490; population 141,141; salary £8 per annum. Grassington District; area 24,442; population 2664; salary £12 per annum.
Dr. Barnes has, owing to his increasing Professional engagements, resigned the appointment of Medical Officer of Health for Shoreditch. The vacancy will take place at Christmas next, as Dr. Barnes did not think it right to retire during the prevalence of the cholera epidemic.
Brixton &c. Dispensary.—Resident Medical Officer.
Bridgewater Union Workhouse.—Medical Officer.
Islington Dispensary.—Surgeon, vice Mr. Summerhayes, resigned.
Middlesex Hospital.—Medical and Surgical Registrars.
Nottingham General Hospital.—Resident House-Surgeon.
Shepton Mallet Union (4th District).—Medical Officer.
St. Mary's Hospital, Manchester.—Assistant House-Surgeon.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

ON MELANOSIS OF THE LUNGS,
AND
OTHER LUNG DISEASES ARISING FROM
INHALATION OF DUST.By F. OPPERT, M.D.,
PHYSICIAN TO THE CITY DISPENSARY.

(Continued from page 364.)

360 Traube (*Deutsche Klinike*, 49, 50) throws the weight of an important case into the scale of those who considered the blackness of the lungs caused by coal. A man whose business was to pack charcoal in baskets, was under Traube's care, and had black expectoration. In this case Traube found the same charcoal particles whose appearance differed from pigment. And as the patient died of tuberculosis, the post-mortem was made and the lungs found black, and the charcoal particles in the alveoles of the lungs. This patient had a dusky-coloured skin during life; and in a very recent case the coal particles were even found by Traube in the tissue.

Forster (*Handb. d. Oprel. Path.*, 1863), and Friedreich (*Arch. Arch.*, 1864), hold as yet up the theory of no coal entering from without.

Langtung, from Austria, published a case, 1865, in *mid's Jahrb.*, whom he had considered, a few years before death, as suffering from Addison's disease; although a chemical examination proved the black matter to be coal, yet the author thought this was secreted from the blood.

I have had twice occasion to examine coal miners' lungs brought to me by Drs. Goodsir and Whitley, one specimen only five days after death. I found the black colour produced by a black granular mass, which could be divided by pressure into very minute granules, having sharp or blunt edges, but always very irregular. On this mass nitric or sulphuric acid acted as little as it did on pulverized coal. The only way to solve the part which was soluble was by boiling it for a continued time in a strong solution of caustic potash, but then part was left undissolved, which was quite different from coal. The tissue of the lungs contained the most of the black deposit, but it was not missed in any other part. This is one of the specimens.

The literature pretty well demonstrates that on the nature of the black deposit there have been different opinions. The earlier observers did not know much about the formation of pigment, which is better known through Virchow's researches and discoveries; they had no doubt that the black matter in the coal miners lungs was of extraneous origin and real coal. They often found the whole lungs of the miners intensely black, and were naturally led to think this owing to the inhalation of coal-dust. When it was found that coal-dust and black pigment could hardly be distinguished by chemical and microscopical examinations, many thought it more natural to consider the black deposit of internal origin, especially as in some cases the patient had had nothing to do with coal-mines. But in recent times it has been clearly proved that dust-particles, which can only have entered the lungs from without, such as silica or indigo, or tobacco, or iron ochre, are deposited in the tissue of the lungs not only in the bronchi, and we may prognose, on that account, the same to be the case with coal-dust.

There is another great difference between former times and now—viz., that the black lung disease in miners is much rarer now than it was. The mines, especially in Scotland, were badly or not at all ventilated thirty years ago, and it is very gratifying here to state, that it was chiefly owing to the exertions and complaints of the medical men whose works I mentioned above that this was changed, and an Act of Parliament passed by which certain regulations were enforced. I recently visited some mines—for instance, those near Nottingham, and found the disease in question hardly known.

As it is not yet proved that the blackness of a coal-miner's lung is caused by coal-dust exclusively, we may examine the opinions of those who think so, and of those who believe that it is caused more or less by pigment. It is stated by the first that coal-dust must accumulate in the lungs of the miners as the air is charged with coal particles, and they are obliged to breathe long and deep, that the sharp-edged particles must find their way into the tissue. The coal particles are found in the bronchial glands, being brought there by the lymphatic vessels in the same way as in the case of Dr. Hoppe and Pohl, in Greisswald, where a patient had his abscesses dressed with coal-powder, and this was afterwards found in the lymphatic vessels and glands. The expectoration of the miners out of work is often quite black, containing the same black matter as found in oil-soot.

On the other hand, it is stated that it is unlikely that coal particles get into the ends of the bronchial ramifications, as these are not continued in straight but in much broken lines, and as the ciliated epithelial cells of the lungs remove all the dust particles very quick, and all foreign bodies are driven from the lungs by coughing. I may as well add that the action of the elastic fibres of the smaller bronchi and air vesicles is very powerful, as demonstrated by asthma, where they are in morbid contraction. Further, it seems strange that coal particles are not found in the blood, whereas pigment circulates with it, so Frerichs for instance, found in ague (Frerichs on *melanæmia Zeitschr für Klin. Medicin.*, 1855, Baud vi. Heft. v., p. 321.) Tigris sul pigmento nella mibza, nel figalo e net sangue. *Gaz. Med. Tosc.*, 1855, No. 31, p. 2557.

There is further the specific gravity, which mostly has been found more in accordance with the supposition of an organic matter being present in the lungs. Brockmann invariably found that the black lungs did not sink. I found so in two specimens, Guillot found the lungs sinking in fluid, but the specimens he examined were tuberculous lungs. This certainly might be soon cleared up by medical men engaged in coal mines.

But there is a third thing probable, that the coal particles are found in miners' lungs, and the blackness yet in some manner owing to pigment. The presence of the coal dust is a reason of augmentation of the pigment, as it leads to congestion. In the spleen congestion leads to blood extravasation, and the blood is transformed into

melanotic matter. This then circulates in the blood passing to the liver, where Frerich observed it in the smaller capillaries microscopically, and even with the simple lens in the larger capillary vessels. This melanotic matter, if present in small amount in the blood, gives the skin of the patient an ashy hue, but if it accumulates in larger patches it is the cause of discolouring it to a remarkable extent. The same has been observed in coal-miners' disease.

In the lungs congestion always leads to pigment formation. It is not necessary that there should be extravasation as in the spleen, which has not the elasticity of the respiratory organs; in that case we might have hæmoptysis, or at least sputa tinged with blood, and this has not been observed in the cases above-mentioned (except Guillot's). But the pulmonary capillaries become loaded with blood, the hæmatin becomes intracapillary free and forms the black matter. It is even quite possible that the pigment when accumulating forms obstonitious as the accumulated bile pigment forms in rare cases in the kidneys.¹

Besides, it might be asked by those who think the blackness to a great degree owing to pigment, how the lungs of stone masons, quarry men, knife grinders, and others, show the same black colour if it is not pigment?

There are some cases mentioned in medical literature, such as Begbie's and Barthelmes's, where it is really difficult to prognose otherwise than that pigment caused the blackness, as the inhaled dust was mill-dust, which is not black. There have been others, such as Cruveilhier's, where the patient, a female, most likely had nothing to do with coal.

At any rate, how much we ever may be satisfied that coal-miners' lungs are coloured black by coal, we cannot deny that in other trades, where dust is inhaled and the lungs are affected and get black, this may possibly be caused by pigment.

Supposing we had to follow the course of single coal particles, I should think it to be as follows:—They first get into the larger bronchi, and later into the smaller. Here they find the epithelial cells, which they enter and fill, as proved by Traube (so far as regards charcoal particles), later yet they get into the thin walls of the air-vesicles, through the walls which are now at parts unprotected by epithelial cells, afterwards into the intervening tissue, and as fresh particles follow, they accumulate here, as Virchow found, whereas they are sooner eliminated from the other parts; at last they get into the elastic trabicular, which resist the most. That they lie in the tissue for years, which seemed to me before very unlikely, I have no doubt is a fact, when they find their way back in the same manner, and are expectorated long after the person has given up his occupation, they then colour the sputum black (as in the case of Leshman Hall).

The accumulation of the particles leads at last to the formation of cavities sometimes of enormous size; but in general this is rare. The specimens in the museums are the most exquisite. At the present time they must be even rarer, as the ventilation is better. Bronchitic tasis may be confounded with them, the more as the walls in both cases are covered with a black smooth membrane; this, therefore, must be carefully removed.

The progress of the morbid changes depends upon circumstances. Especially, I have to mention that there are different classes of mixtures, and that some are more endangered than others. There are those who blast the rock by mixing powder when new galleries are made. There are the bolers or hewers, who work with a pickaxe lying on the side or sitting doubled up. The third class

are the fillers or putters, who have easier work and move about especially where horses are used. The first are most in danger, the last the least.

Another difference exists as to the holidays. Even now the miners work in some Scotch mines ten days, and then have three holidays, and have to work for nine or ten hours a day. I was told in Basford, near Nottingham, that they have at present two or three holidays per week. In the Harg mines they worked till lately eight hours per day, or five days of the week, now they have mostly three free days.

The miners in metallurgic mines have not exactly to do with coals, but they nevertheless inhale soot from the oil lamps. Soot being smoother than coal particles may possibly rarer cause cavities. During the last ten years the disease has been observed in the mines between Glasgow and Edinburgh, in some of Belgium, near Bochum, in Westphalia (after a communication of Dr. Klostermen), in the brown coal-mines near Halle, in the Gruneberg mines (S. Casper, *Wochenschr.*, Bd. x., H. 2) in the Harg mountain, where there are only metallurgic mines.

Of other trades, the blacksmiths come next. I had several under my care—one, a foreman in an engine-factory, had a remarkable black expectoration for a time, which he got rid of by taking a holiday and using expectorants besides. Traube had a similar case in the Berlin Charité, a man Ferbitz, who, I think, died there. I had some others whose cases I did not take particular notice of at the time. Their lungs may be expected to be black should they spit black when not engaged in their business. I found in the Registrar-General's report, published in the London morning papers of June 6, 1866, the death mentioned of a blacksmith (forty-seven years) of melanosis of the lungs (six months).

In aged people the lungs have been found black after death (Guillot, Virchow); but I do not know a reliable case where these had black expectoration during life. In their case we may reasonably suppose that pigment is the cause of the blackness, when they had nothing to do with coal during life.

Chimney-sweepers, metal-workers, coal-burners, china-scourers, china-workers, millers, brass-founders, are occasionally mentioned as having black expectoration. I had a tincase-maker (23) lately at the City Dispensary, who spat black, and by inquiring I found that he worked near a charcoal fire, by which the irons they use were heated, and the workshop was full of dust. He had asthma, as by the physical examination I found present compound normal vesicular breathing everywhere; slight dry and moist râles in the lower lobes. Spirometric capacity, 2950 cub. cent. (height, 168 cent.; circumference 75; mobility, 4½); it should have been 3300 cub. cent.

A large class of sufferers from dust inhalations are knife-grinders, needle-pointers. In their case it has been proved that stone grist or silica enters the lungs. Marshal Hall had a great many cases in Sheffield. Dr. Greenhow found microscopically only a few siliceous particles in the tissue of a razor-grinder; but Dr. Peacock and others extracted a remarkable amount of silica from the lungs by incision and distillation. The change in the lung tissue had this similarity with coal-miners' lung, that there were dense bands pervading the tissue, the colour black, but not so intensive, but how it could be even so without the pigment augmented to an abnormal extent, I cannot see.

The danger to the lungs in different trades where dust is inhaled must be the greater the more the pulverized matter is like stone or silica; consequently those miners who blast suffer the most, because the pulverized rock enters their lungs, which already contain coal-dust in more or less masses.

Indigo dust has been found in the lungs of indigo workmen (Friedrich), and tobacco of tobacco manufacturers; but the most remarkable case is that observed by Professor Zeuker, of Erlangen, where iron ochre was found in the lungs of a young woman (31) who was engaged in paper colouring. He calls it siderosis. The whole lungs had colour like a red brick, and the iron ochre particles were

¹ Frerich's "Diseases of the Liver," p. 102. The bile pigment is pre-eminently distinct in the straight tubules of the pyramids, the calibre of which becomes blocked up with hard coal-like masses. It might be imagined that such a deposit would greatly interfere with the secreting function of the kidneys, and observation proves that it really does so. This coal-like, hard brittle mass, is like the material of black gall-stones, either dissolves in caustic potash slowly and incompletely, or is quite insoluble.

seen even by the simple lens. The epithelial cells were filled with such particles, and the intra-lobular tissue contained them in great number. The bronchial glands were coloured red as well (*Tagelb. d. Natur forscherverf.*, 1866). This case has been made by Zeuker the subject of a most elaborate paper, wherein the whole matter is treated with great clearness and thought.

The diseases caused by inhalation of Scheele's green by artificial flower-makers, which caused such painful sensation a few years ago, belong also to the class of inhalation diseases, as the noxious matter is first introduced into the lungs; but there is this difference, that the noxious matter being a strong poison it soon affects the whole constitution. I hope that this disease belongs to the past. Melanotic cancer has nothing to do with the subject which engages our attention, as it has nothing in common with it but the colour, which is caused by pigment, or more likely coal deposited into its tissue; otherwise it belongs to that large family of tumours, which are only the symptoms of a certain blood dyscrasia, leading invariably to a fatal end.

There has been a controversy as to the melanotic and tuberculous process excluding each other. Brockmann observed that miners, even of phthisical parents, suffered from miners' disease without tubercles, and when he found tubercles he considered them only as accidental. The fact is, that both diseases have their seat in the upper lobes of the lungs, and that they meet there sometimes. In some cases, as Guillot observed, especially in aged people, excessive pigment formation puts a stop to the progress of tuberculous disease by the pigment obliterating the small capillaries which tend the tubercles. Tuberculosis often favours the formation of pigment, as the lungs of consumptive patients are mostly found very black.

If a coal-miner, whose lungs are more or less pervaded by coal particles, is attacked by tuberculosis, I should think that he must sooner succumb to the new disease, which finds the lungs already weakened and in abnormal condition.

The most constant lung disease found in combination with coal-miners' black lungs is emphysema; in knife-grinders I suppose it is less frequent, and of the other diseases caused by dust inhalation are not a sufficient number of cases known. It is quite easy to understand that the bronchitis of which they suffer for years leads to emphysema.

Pneumonia (mostly interstitial) I suppose to be the more frequent the heavier the dust is which was inhaled. It is comparatively rare with coal-miners; I only know of one case communicated to me by Dr. Biefel, where the sputa (*casts*) proved the pneumonia during life. They had a black colour, were fibrinous, and had a phase in conformity with the bronchial ramifications.

Pleuritic exudation is not so rare in melanotic patients, and the black particles in the fluid, which formerly were considered to be pigment, we should now hold to be real coal.

At present this seems to me the right standing point—that we should not separate the different diseases caused by inhalation of dust particles. Recent observations have demonstrated that dust enters all parts of the lungs when inhaled for months and years, and that they are the cause of a disease which is very similar in its symptoms, although some difference exists, based upon the nature of the noxious matter. Melanosis caused by the inhalation of oil-soot may be the mildest form of the inhalation diseases, it may as a disease *per se* rarely now lead to death, but it does so certainly. Some inhalation diseases I may have overlooked, and not named; I am sure there will soon be some more mentioned in medical literature. Some I have mentioned will not be many more times observed. At least I trust that they will soon prohibit paper colouring by iron ochre in Germany.

SYMPTOMS OF MELANOSIS AND SIMILAR INHALATION DISEASES.

The symptoms of these diseases are trifling in the beginning, so that they mostly are overlooked by the patient.

Slight indigestion, uneasiness of the chest, may in most cases exist for many years before they complain; gradually, however, dyspnoea troubles them more, and in the later stages the dyspnoea is of very alarming nature. It is in general so constant, that you always hear mentioned the miners' asthma, the grinders' asthma, &c. A slight cough with some mucous expectoration is early present, but occasionally the colour of the sputum becomes black, and in the more serious cases it has that remarkable appearance of black ink, and is sometimes expectorated in considerable quantities when cavities are formed. Microscopically we find the coal particles which are inhaled, or whatever other dust may be the noxious matter. Blood has been exceedingly rarely observed, and elastic tissue only in cases where tuberculosis was present as well. The fibrinous ramificated sputa (bronchial casts) we might expect to find under favourable circumstances by close observation. Fever is in general not present—on the contrary, the pulse is usually slow and weak; it is on account of supervening inflammation that heat and frequency of the pulse show themselves.

A dusky hue of the skin has been frequently observed (recently by Traube), and mental depression, hypochondriac mood is rarely absent.

The physical examination has not found, as yet, the amount of attention it ought to have. Undoubtedly it is not in accordance with the importance of the disease. The percussion found is usually rather louder and more extended than in the normal condition; slight râles, dry and moist, are found at different places, but the breathing in general of the vesicular type.

All this is changed by complications with pleuritis, pneumonia, &c. If the ictus cordis is essentially diminished is not yet known. The spirometric experiment shows the capacity of the lungs reduced.

The prognosis depends partly on the nature of the inhaled noxious matter, partly on the circumstances of life in which the patient is.

As for diagnosis, I mention that the disease might be confounded with Addison's disease on account of the colour of the skin.

The treatment has to be divided into preventive and curative.

As for coal-miners, the principal thing is ventilation. This may be done by fans, funnels, as on board ship, by exhaust-pumps and bellows, and by fires. The last are the best, and I found them in the best ventilated mines; they are in Durham and Nottinghamshire, only there is a considerable difference in the results. In some mines, where the air was good in the mains, the remoter galleries participated less in the beneficial effect of ventilation, and the air contained less oxygen and more sulphuretted hydrogen. I am quite sure that in many places the fires are too small—for instance, in Derbyshire. It is also important that the double-doors and deal partitions should be placed judiciously. Workshops should as well be ventilated; knife-grinders should have ventilating fans. It is further important that the operatives in all these trades should have sufficient holidays. In some cases a mechanical contrivance may be invented to keep the dust from the lungs. The ordinary respirators may be of service in some cases.

If a patient applies for advice, and we find out the nature of his disease, we must counsel him to leave off his noxious occupation at once; by this he will be more benefited than by anything else. Although I have not had much occasion to try remedies, I should think that expectorants will do good mostly, and a tonic regimen will certainly do no harm. Complications of the lung diseases, with inflammation or congestion in the abdominal organs, have to be treated according to the present state of science.

Change of air and habits under circumstances of his whole life may sometimes save the patient.

In order to further our knowledge of the disease and the treatment thereof, it would be desirable to have numerous cases and histories from medical men attending coal-miners, needle-pointers, &c. A better light might be shed on much that is doubtful if they put down their

observations regularly, following up more important cases from the commencement to the end, not omitting the post-mortem. The physical examination of the lungs, that of the sputa and urine, ought not to be neglected, and all intercurrent diseases, especially pneumonia, taken note of. By this it might, for instance, at the post-mortem be accounted for why parts of the lungs show an abnormal specific gravity, the case-book relating several attacks of inflammation. It ought to be stated, also, if the liver and spleen have contained black deposit in excess, in accordance with the hypochondric propensities observed during life.

The tissue of the lungs might be more minutely examined by the microscope in order to find out if the melanotic matter is more present in the tissue or in the mucous membrane, and the solubility of this matter might be tested thoroughly by concentrated solutions of caustic potash. The examinations for iron by hydrochloric, and silica by hydrofluoric acid, &c., in an interesting specimen, would be gladly undertaken by competent authorities.

All other particulars, as ventilation, number of holidays, mode of life, ought to be specified in the cases.

In conclusion, I once more draw the attention of the reader to the state and condition of the British miner, who is instrumental in bringing to day the yearly amount of 68,000,000 tons of coals, which constitute a considerable part of the wealth of this kingdom, but who lives a life full of care and bare of joy, and born to a cruel fate, dies at last a cruel death. Not able, in most cases, to think for himself, drudging along his dreary path of existence, he wants commiserating friends to take up his cause. Wherever medical men are in a position to befriend him, to ameliorate his condition in general, I wish and hope they may do so by all means. And those who profess to take an interest in all matters of hygiene and public health, I wish may visit the mines and miners, to look after the ventilation of the first, and the mode of life of the latter, and consider in what better way they may be protected from disease.

REMARKS ON

CONGENITAL AND OTHER ABNORMALITIES IN THE SKELETON OF THE UPPER EXTREMITY.

By ALEXANDER MACALISTER, L.R.C.S.I., &c.

DEMONSTRATOR OF ANATOMY, ROYAL COLLEGE OF SURGEONS.

THE occasional varieties found in the component parts of the upper extremity in man are invested with a very great degree of interest when we take into consideration the many forms in which that appendage is developed in any of the vertebrate classes—mammals, birds, reptiles, or fish, as in accordance with the observation of Meckel, human anomalies always, or, at least generally, agree with the regular arrangement of parts in lower animals; and though the bony structures are less liable to exhibit these adventitious gradations of form than are the other and softer tissues, yet we do find in the human upper limb, and that not very seldom, departures from the usual dispositions of these parts. One of these, the supra-condyloid process of the humerus, has been carefully investigated and thoroughly described by Professor Struthers¹ of Aberdeen, and others, have been noticed by various anatomists, though few with such minuteness and accuracy. A good many of these abnormalities, unconnected with disease or accident, have come under my notice in the dissecting-room of the Royal College of Surgeons, and these I have made the basis of the following remarks, on the most interesting and important deviations in arrangement of the skeleton of the upper limbs.

Of the scapula, besides slighter variations in shape and size, in gibbosity or straightness of outline, I have found a few interesting peculiarities. An exaggeration of development in the tubercle of Retzius, I have twice seen occurring to an extent resembling the normal state in the elephant, or not unlike the prominent spur in many non-clavicular rodents. A spur often exists at the origin of the *teres major*, projecting outwards from the axillary costa.

The conversion of the supra-scapular notch into an osseous foramen is a variety commonly met with; obviously the result of the ossification of the ligament which normally bridges it over; to this the nerve and artery usually retain their normal relations. Humphreys¹ has recorded an instance in which this osseous foramen co-existed with a perfect notch, but does not relate the position of the vessels and nerve with regard to it. The complete obliteration of the notch I have seen exemplified in a small but strongly-marked scapula from the celebrated cave Uamh-Fraing, in the Island of Eigg. In several other instances of this kind, examined in a recent state, the supra-scapular ligament was either completely undeveloped or else arose from the middle of the superior costa, and was inserted into the root of the coracoid process. One of these instances, in which the notch was obliterated, had two separate fibrous bands, one over the other; beneath the lower passed the supra-scapular nerve, and under the upper ran the corresponding artery.

The presence of a detached piece of bone of a triangular quadrilateral or ovate outline, intercalated between the acromial end of the clavicle and the spine of the scapula, I have ascertained in a good many instances. In general this was symmetrically developed on both sides and in one shoulder joint, a subject of chronic rheumatic arthritis, this formed the roof of the glenoid cavity, and was eburnated on its under surface, to correspond with the polished porcellaneous deposit on the humeral head underneath. The occasional existence of this separate fragment was noticed by Sömmering² and Meckel.³ Its nature is easily understood, as it arises from a want of osseous union, sometimes between the terminal and basal ossific nuclei of the acromion, or more commonly between the basal nucleus and the spine, as in order of time the two acromial centres usually coalesce before they unite with the spine of the scapula. In the former case the intercalary segment is narrow, and somewhat quadrilateral, in the latter it is broad and triangular. Usually the normal acromio-clavicular articulation is perfect between the detached fragment and the clavicle, while the former is united to the scapular spine by a layer of cartilage, or according to Humphreys, by a fibrous tissue. Weber,⁴ however, has recorded that he saw one example in which the separated portion of the acromion articulated by a regular capsular ligament with the spine of the scapula, and thus led to a very marked increase in the freedom of motion in this situation. A rarer malformation consists in the arrest of development either in the centre of the supra-spinous or infra-spinous fossæ, more frequently the latter, causing an irregular small deficiency, closed by membrane, or else a permanently cartilaginous posterior border may remain, as we find in some ruminants and pachyderms. The former condition, as far as I can ascertain from examination, appears to arise from a central arrest of development in the course of ossification, although Humphreys⁵ has given it as his opinion that it is the result of an excessive degree of that modelling absorption, by which the centre of the blade is thinned as its edges thicken.

Complete deficiency of the scapula has been reported in some fœtuses without upper extremities, but even when the arms are wanting the scapula is often present, and

Otto has found the glenoid cavity in these cases to be replaced by a tubercle. An instance is reported by Höchstadter,¹ in which this bone was cleft.

Of irregularities in development of the clavicle I have seen few worthy of note. Varieties of curve, lateral want of symmetry, irregularities of length, &c., are extremely common. A facet for articulation with the cartilage of the first rib, near its sternal extremity, is not unfrequently seen, reminding us of the state of this bone in the megatherium, where it apparently was united to the cartilage of the first rib, and fell short of the sternum. In cases where this facet exists a regular synovial membrane is interposed, and a slight capsule frequently present. It is much more rare to find a facet on the under surface of the outer third, where it rests upon the coracoid process. This condition I have never seen, but it is described by Knox.² A spur occasionally exists in place of the usual slight conoid tubercle, but this is but an exaggeration of the normal appearance, and I have known an osseous epiphysary crust to exist on both the acromial as well as the sternal extremity of the bone. The existence of a medullary canal has been the subject of difference of opinion. Cloquet mentions the presence of such in extreme old age, while Todd describes a cylindrical canal as constantly to be seen. In general, I have found it impossible to demonstrate the existence of a definite canal with an endosteal lining, although there are always large and communicating interspaces in the central loose cancellous tissue of the bone. Once or twice, however, I have made out distinctly the existence of this space, as a distinct canal, in middle-aged subjects. Complete absence of the clavicles has been found in monsters, in whom the upper extremities were absent. Cases of this kind are recorded by Otto,³ and Henkel⁴ has seen this anomaly even when the upper extremities were developed. A curious variety has been recorded by Martin,⁵ in which the acromial extremity of this bone was deficient, and a thin expanded process of the acromion scapular took its place. Prochaska⁶ has mentioned a somewhat similar case, in which the place of the absent portion of bone was supplied by a ligament; and Otto⁷ has related some instances in which the sternal extremity was suppressed. On the subject of this bone we have an admirable memoir by Professor Struthers, to which I would refer for further information concerning it.

Of the long bones of the limb there are few varieties on record, and still fewer have come within the range of my observation. The supra-condyloid process and ligament so carefully described by Prof. Struthers (*loc. cit. antea*), I have seen about four times, always symmetrical in cases where the two arms were submitted to my examination. I have seen it several times in detached bones, and varying considerably in length; its co-existence with a high bifurcation of the brachial artery has been already noticed, and every information respecting it is to be obtained from the author above quoted.

A perforation between the coronoid and the olecranal fossæ of the humerus, as in some of the quadrumania and carnivora, I have also seen, and this Meckel describes as more frequent in Papuans and Negroes than in Europeans. My friend Dr. Gavin of Boston, U.S., has informed me that he has seen it existing in a large number of the humeri of North American Indians, dug up in an ancient camp on Long Island, a fact likewise noticed and described by Dr. Jackson of Boston. Otto has recorded a case of absence of the bicipital groove. Rokitansky⁸ mentions

the complete deficiency of this bone. A case of this kind is mentioned likewise by Dumeril,¹ in which the hand articulated directly with the scapula. In another example, when the forearm was absent, this bone became thin at its lower end and ended in two processes.² Flachsland³ reports another instance of malformation, in which the hand was directly articulated to the lower end of the humerus, the forearm bones being abortive, and a similar case is referred to by Palletta.⁴ In some cases of congenital luxations the capitulum is described as being either deficient or rudimentary.

Of the radius cases have been described of complete or partial deficiency. When the former state occurs Weidemann⁵ remarks that the thumb and its carpal and metacarpal bones are also wanting. Cruveilhier has related an example of deficiency of the lower half of the bone. Mr. Adams, in Todd's Cyclopædia, has described and figured an instance of congenital luxation of the elbow, in which the tubercle of this bone rests in the lesser sigmoid cavity of the ulna, and the neck is prolonged backwards twice its natural length; in fact, to the level of the summit of the olecranon.

Complete deficiency of the ulna is likewise recorded,⁶ but more interesting anomalies are mentioned in relation to it. Chenval⁷ has described the existence of a bony nodule in the tendon of the triceps situated above the point of the olecranon. This is similar to the arrangement in *Pipa Americana*, where such a tubercle normally exists; a similar instance is referred to by Rosenmüller,⁸ and, if we take the patella as the homotype of the olecranon, this may remind us of the second patella in the ostrich. A corresponding sesamoid development has been described by Sömmering⁹ as existing above the coronoid process of this bone.

The carpal bones I have found to be the seat of many varieties in number, size, and articulations. I have at present an interesting group of nine bones removed from a large hand in the dissecting-room during the past session; of these the scaphoid exhibits the signs of chronic arthritic disease, and has an extremely small radial facet, a sharp rough tubercle, and a deep hollow for the magnum with acute margins. The lunar bone has but a shallow concavity for the magnum, a rough facet for the cuneiform, and an eburnated surface for the unciform; it also is modified slightly by chronic rheumatic arthritis; the pisiform is quite typical; the cuneiform is large and irregular, having its normal three facets; the trapezium is very large, with a prominent spur for the external lateral ligament, and a prominent and broad facet for the second metacarpal bone. The os magnum, very wide from before backwards, has on its lower end but two facets nearly equal in size, one for the second, the other for the third metacarpal; the head is smaller proportionally than natural, and is to a considerable extent eburnated. The trapezoid is perfectly normal, and the unciform exhibits a very small porcellanous surface where it rests on the lunar bone; the supplementary bone is of a triangular shape, and is placed on the back and upper part of the head of the magnum between it and the scaphoid; it has one small and three large surfaces, one somewhat quadrilateral, which articulates with the radius entering into the wrist-joint, another rough and cancellous, which was joined to

the lunar, a third for the scaphoid, and a fourth very small for the os magnum.

Examples of this additional bone have been recorded by Otto and Sandifort. Meckel has described a ninth bone between the cuneiform and the os magnum.¹ Dr. Smith,² in his work on "Fractures and Dislocations," records an example in which the lunar bone was divided into two parts.

Among animals we find in the carpus of the orang outang an intermediate bone described by Vrolik³ as placed between the scaphoid, lunar, magnum, trapezium and trapezoid; this ossicle, however, does not correspond to the example given above, but is evidently of a different type. It is remarked by Vrolik that it is undeveloped in the carpus of the chimpanzee, but well marked in that of the orang. An instance of diminution of number in these bones is recorded by Jourdain⁴ in a carpus of a negro in the museum of the Jardin des Plantes, with seven bones, the lunar and cuneiform being fused in both hands, and a similar instance is described by Heusinger.⁵ Cruveilhier gives a case in which the trapezium was confounded with the trapezoid and scaphoid. The variations in the number of articular facets are not uncommon. The lunar and unciform, which generally meet, may not unfrequently be separated, and I have seen five articular facets on the trapezoid bone; in fact, minute differences in configuration may be detected in at least one out of every three series of carpal bones. In other animals they are also liable to vary. Otto quotes an instance in which the carpus of a horse consisted of ten instead of six bones, and others would doubtless be found, if sought for carefully. Deficiency of the trapezium and scaphoid has been described in some instances of abortive radius, and the pisiform has, I believe, been absent in some few instances.

In cases of the not uncommon anomaly of six fingers a supernumerary metacarpal may exist.⁶ I have seen this in the hand of a living man of about forty years of age, where it existed on the ulnar side of both hands, and was probably articulated to the unciform bone, but was much shorter than any of the normal metacarpals. Occasionally the metacarpal of the thumb has been absent, and more rarely that of the middle finger.

Variations of the phalanges have been described by deficiency, or perhaps coalescence, the second and third being fused together, more particularly in the little finger. I have seen this more commonly in the toes, but have not met with an example in the hand. A still rarer case is recorded by Columbus,⁷ where a supernumerary phalanx existed in the fingers—rare, because except in cetacea and birds the number of phalanges rarely exceeds three; in the former group, however, they sometimes amount to five, six, or seven, and in the latter vary from one to five.

ON OZONE

IN ITS RELATIONS TO ANIMAL CHARCOAL.

By T. W. TOBIN.

(Concluded from page 361.)

THE accepted theory of ozone among chemists is as of an active state of oxygen, and like the elementary principles of electricity, it is never generated otherwise than accompanied by a corresponding or induced quantity of another opposing element, *antozone*; although opposite and unlike in their nature, evincing properties positive and negative, yet having a strong mutual affinity for each other, they combine and become neutral when opportunity offers;

and, in fine, bearing out their semblance to electric phenomena still more intimately, they may be again isolated, as just shown, by—1st, chemical decomposition; 2nd, structural arrangement, as in magneto-electricity; and 3rd, by re-combination and disturbance of form, as in frictional electricity. The Franklinian theory as to the actual presence or absence of a single principle, or the more recently accepted notion of the compound constitution of a subtle fluid here also equally applies; and the question arises, do there exist two distinctive elements—ozone, antozone? Or are their effects attributable to the intensity and relaxation of a simple primary principle? By evaporation certain liquids may be ozonized, and the law applies equally to many others beside water, and ether. In the last experiment we generated an amount of the active element—ozone—and may reasonably anticipate a corresponding absence of this, or an induced proportion of its coeval principle; let, therefore, the same experiment be repeated in the following manner:—Place in a boiling flask an ounce of distilled water, as before; some test-paper must then be prepared as follows a sheet of ordinary writing paper is to be saturated with the alcoholic test-liquid of gum guaiacum and quickly dried over the flame of a spirit lamp, the colour of the paper should assume a light green tint. A strip of this paper is to be inserted into the neck of the flask, and the whole placed on a sand bath and moderately heated up to the boiling point, ebullition may be continued, care being taken not to wet the test-paper. The contents of the vessel will be in the following condition, as the test-paper will show: the vapour is absent of ozone, or, in other words, the presence of antozone is indicated by becoming discoloured or deprived of the amount of oxygen it previously held in combination; the water on cooling as before would indicate the presence of ozone, but they have been but mechanically separated, and by quickly shaking the contents the opposing principles will combine, and testing the same when cool a very dissimilar effect will be apparent from that previously described, little or no ozone being present. In condensing the vapour gives up the antozone and neutralises the excess of ozone in the liquid from which it was derived; in the presence of the atmosphere it however behaves otherwise, ozonizing the oxygen therein in condensing, it yields a large amount of nascent oxygen, evident to the test-paper described.

The fact may be still further verified. Four ounces of distilled water, unboiled as before, is to be prepared by adding one drachm of the test fluid, the gum of which will be precipitated and render the solution of an opalescent tinge; two similar quantities of this compound solution are to be placed in two similar test tubes, to about a quarter fill the same, one is to be corked, allowing a small vent aperture for expansion; the other, as previous, should have a strip of green test paper inserted at its mouth and otherwise left free for evaporation; both are now to be placed in a sand bath and gently heated; they will gradually, but decidedly, be observed to change from white to blue, of deeper intensity as they reach a certain temperature, about the boiling point, they may then be stopped. The colour is indicative of an excess of ozone in both. The test paper shows an absence of ozone in the vapour of one, but in the other instance both vapour and liquid are confined; and if each bear opposite properties, by commingling them, a neutral result must inevitably ensue. Such we find to be the case; but in order that the experiment may be satisfactory, the stoppered tube should be allowed to cool, or be artificially cooled by a stream of water, and in that state shaken to condense the vapour in the liquid. Comparing this with the other, although not devoid of colour, it will be little indicative of free oxygen, the quantity lost by evaporation through the vent aperture or otherwise. But further to prove that the gum is not structurally altered, it may be deprived of all the oxygen it contains by a deoxidizing agent, sulphuretted hydrogen. As an incidental observation, it may be noted how large a quantity of sulphuretted hydrogen is required to deprive the gum of its oxygen when oxydized by ozone.

Water, then, in itself, may give rise to ozone, and inductively to antozone; why it is that certain liquids evaporating should become ozonized—why they should suffer partial decomposition, for it is only those substances which contain oxygen—in combination with another opposite element, that are capable of so doing, cannot be said with any amount of certainty. Oxygen is materially heavier, denser, than hydrogen, in the ratio of 8 to 1. When in combination the action of heat in a lesser form, such as to raise it to 212°, is as of a partial disturbance of its constitution; the effect of this is, that the hydrogen probably absorbs and becomes satisfied with heat in one-eighth the time necessary for accomplishing the same effect on the oxygen, it becomes, during the full accomplishment of this process on the oxygen, partially volatilized. Hence in the vapour is found the hydrogen or antozone principle, in the water the ozone. Under microscopic examination the decomposition of water by voltaic electricity presents an appearance confirmatory of this theory, the gasses being freed much in the same manner as here described.

It may be observed, if heat be continued beyond the boiling point in the last experiment, much of the ozone will be expelled again; so it is when, by constant evaporation, a liquid becomes saturated with ozone, much is again discharged into the atmosphere.

In this wonderful generative agent—viz., evaporation is the vast supply of ozone maintained in nature. In the evaporation consequent upon rainfall, that constantly saturates the face of the earth, and from the condensation of the vapour generated therefrom, is animal and vegetable organism nourished and sustained. Organized substances in generation and decay in health and disease require ozone for their development—in the one case, for the cellular secretions and constructing the animal tissue; in the other, for the full and speedy oxidization of the germ of decomposition. The combinations, moreover, ozone effects with healthy organism in the part of food is striking, and worthy of observation. The gluten of wheat, milk, potato, and many other essential articles of nutrition are abundantly impregnated with free ozone, as may be detected by tincture of gum guaiacum (Braude). Truly, we may observe, that this is another instance of an all-wise Providence for the sustenance of our being. What is more bountifully supplied us than water? What a more faithful minister to our wants? But in it we also possess a tender guardian, gently abstracting from its bosom the very essence of life; and still more gently, day by day, feeding the tender plant, and satisfying the thirsty forest with their daily wants—breathing to us the very spirit of life—and even then its mission is not expended; it is finally ordained to enshrine, as in a pall, the deadly putrefaction, fatal and yet co-existent with such grandeur.

The active energy of ozone in the atmosphere may be directly observed in many ways in its prejudicial behaviour to artificial and manufactured products. Metallic substances, iron more especially, quickly becomes oxidized if alternately exposed to water and the atmosphere, owing to the generation of ozone. Water boiled in iron vessels is known speedily to destroy such by continued rusting; the decay of stonework and timber may be equally attributable to the same cause. In the natural purification of water, evaporation and the generation of ozone thereby is prominently manifest; the soil through which the water percolates consisting of an absorbent material and possessing no actual ozonizing properties, simply brings the liquid into more intimate contact with the air and promotes evaporation. On this principle the old systems of artificial filtration through gravel and sand, and other finely divided substances, owe their virtue. From the foregoing remarks it is evident, also, that by boiling water containing organic impurity much becomes oxidized by ozone; but neither instance will bear comparison with the effects produced by animal charcoal.

Animal charcoal, or bone black, consists of carbon and phosphate of lime principally, but also in conjunction with

many minor substances, of which carbonate of lime is the most prominent. To be of good quality it should present a dullish cast, and not suffer any loss from organic matter by exposure to a red heat in a closed retort. On ignition a purely white residue should remain; if clayey matter or metallic oxides be present they will be conspicuous on the surface after ignition, and the charcoal has in all probability been previously employed for filtering purposes. The proportion of actual carbon present in the average quality of animal charcoal is about 20 per cent. (Stenhouse), the remaining per centage consisting chiefly of phosphates of lime and magnesia. Newly burned charcoal is remarkable for its great absorbent power, both for gases and liquids. If a test glass be filled with water, a large quantity of fresh burned charcoal may be cautiously added to its contents without overflowing it.

In a freshly prepared condition animal charcoal is but a feeble ozonizer, not even bearing comparison with many other less important substances; but the curious and remarkable property of its ozonizing power is its increase of capacity by constant use. This may be achieved by being in contact for years with water containing large quantities of soluble organic matter. The material after such treatment presents a different appearance to new charcoal, being of a dead gray cast, much lighter in colour than when new, and it is entirely free from any surface powder that always attends new charcoal, and renders the liquid black on washing.

When investigating this property it occurred to me that the same power existed equally in both old and new charcoal, but from the circumstance of new charcoal being invariably covered with a thin fine powder, the pores on its surface were impaired; or that from this or other cause it was prevented from absorbing the test-liquid into its cells, and consequently calling a less area of surface into operation as an ozonizing agent. To ascertain the correctness of this view I submitted equal quantities of new and old charcoal (by old I mean such as has been used for several years as a filtering medium) to distilled water and spirits of wine alternately for over a fortnight, taking precaution finally to thoroughly wash both samples in water. They were then dried at ordinary temperature and tested for their ozonizing capacity. The new I found to bear but very poor comparison with the old for ozonizing power.

The next point of interest to ascertain was, as to which of the constituent elements composing the charcoal the property owed its origin first, neither phosphate of lime, carbonate of lime, nor carbon, whether in the form of wood charcoal, graphite or other slate, is capable of ozonizing to any extent whatever, wood charcoal, however, taking slight exception to the rule. In substance, therefore, the constituents are inert. Samples of good ozonizing animal charcoal, such as just described as old, were treated as follows:—1st, to incuigation to expel the carbonaceous and volatile matter, leaving the phosphate of lime and earthy salts; 2nd, by digestion with hydrochloric acid to abstract the calcigenous phosphates and carbonates; and finally, another sample was pulverized as finely as possible in a pestle and mortar. On testing each residue the results showed their capacity, when compared with the original intact substance, was considerably impaired for ozone. Any material alteration, moreover, in form or substance, causes a proportionate lessening of its power, and even the accumulation of suspended organic matter arrested in the process of filtration, or of gum and resin on the surface, eventually determines a cessation of this property.

But the affinity to which this is attributable: it consists of that of the second order necessary for chemical combination as first set forth, and the condition governing its action is, that the substance possess a surface mechanically fitted for the reception and retention of oxygen. The oxygen thus situated seems to evince all the energy of combination, but lacking that force necessary for the constitution of a new form. The action of this induced

oxygen lies only in proximity to the surface of the charcoal, or other ozonible substance to which it owes its origin; for the purpose of calling its energy into play, actual contact is indispensable. This is illustrated very strikingly in the ensuing curious experiment.¹ If coarsely powdered animal charcoal be intimately mixed with small portions of phosphorous, the great oxidizing power of the charcoal quickly determines the combustion of the phosphorous; again, should an accidental scrap of iron find its way into charcoal used as a filtering medium, an occurrence not uncommon, the metal becomes soon covered with a thick coating of oxide which eventually cements charcoal and iron into a conglomerate mass.

Oxide of iron in itself is an ozonizing substance; thus it is, that iron being a less oxidizable metal than zinc, becomes converted into dust on exposure to the atmosphere in a considerably shorter period of time than the latter metal, simply from the fact that the oxide regenerates ozone, and hence, continuously supplies the combining oxygen to the compound. Most acids are ozonizing bodies, that is, possess the power of generating ozone; thus by this means they determine the oxidation of the base with which they combine. Zinc and iron are slowly oxidizable in water, if devoid of acid; but in the presence of sulphuric or nitric acid, owing to the ozonizing effect of such on the oxygen of the water speedily determines the oxidation of the metal and forms a secondary compound salt.

Substances capable of ozonizing, as a rule, may be artificially produced by certain substances containing oxygen as an element, and capable of having such expelled by heat or other agency, without otherwise altering or destroying their structural arrangement. In organic and other natural products this property is also often met with to a considerable degree.

Animal charcoal is of the class of substances in question, by depriving the organic substance in the process of burning of its combined oxygen, it becomes thus permanently ozonizable. This process of burning in practice is rarely if ever achieved in the first instance. Sugar refiners and others using this charcoal find that after the second or third burning the substance is considerably improved in its filtering power for this reason. In the use of animal charcoal for filtering impure water great caution is requisite in its proper selection and adaptation. If badly-burned charcoal be chosen it will probably give rise to a numerous series of failures. A species of putrefaction of the uncharred organic remains is almost certain to set up in the locality of the defective parts, and soon, by spreading, contaminate the whole of the charcoal, together with any substance in contact with it. We find instances occur that water, after having been in contact with this substance, becomes actually less pure from the introduction of this extraneous matter. Such qualities of charcoal are actually useless for all practical application, and on the evidence of the tests before mentioned should be scrupulously rejected.

The treatment of animal charcoal by reburning, solely for this reason, is beneficial; for all others it is depreciatory to its virtue. The ozonizing capacity has been shown previously to exist in the combined substance, that each elementary constituent was incapable of exercising this property, and hence we may reason, in proportion, that the balanced constituents are varied from their natural combination, so would the ozonizing power be impoverished. Washing with dilute muriatic acid and reburning have been much used in the revivification of expended charcoal. The preference is now given almost entirely in favour of the latter, but in practice they are both after a certain time incapable of effecting their purpose, and the charcoal becomes useless. In theory the failure is attributable to similar though opposite causes. By the treatment with the muriatic acid, the organic matter that may be present on the surface of the charcoal is loosened, and the phosphate of lime and earthy salts by being super-

ficially destroyed leaves a partially renewed surface of the charcoal for ozonic action. The carbon, however, is left in excess. In reburning the organic matter is charred, and part of the carbon of it, together with that of the charcoal, is volatilized. A new surface is here again exposed, but the phosphates and earthy salts are in excess, and the residual charcoal from the organic matter is introduced as a foreign element on the surface of the renewed charcoal, hence in course of time the excesses of these extraneously introduced substances determines the cessation of the normal virtue of the charcoal. Much waste and a great amount of labour is therefore expended in these fruitless restorations of old charcoal and freeing it from impurities.

By certain of the experiments herein enumerated animal charcoal has been shown by constant use to become improved. After a continued action on soluble organic matter for years the ozonizing power has been stated to have been increased. How great, then, the fallacy of submitting such to renewal, if by that process the standard of its ozonizing capacity be reduced to its original condition, or still worse, lessened, as above shown.

The defect of used charcoal has been sought for in the wrong direction. If the impurity consists of calcinable matter, such as suspended clayey substance, chalk, &c., burning is ineffective; if, on the other hand, from organic substance, other known chemical means for its extraction should have been resorted to, and thus the acquired impurity abstracted, leaving the charcoal improved by the process of its action, and literally imperishable.

Hospital Reports.

MIDDLESEX HOSPITAL.

WE have already noticed five cases that came under the care of Dr. Greenhow, and one under that of Dr. Murchison. Since the commencement of the epidemic only twelve other cases have been admitted, the majority in a state of collapse; six of the cases have died, and one remains under treatment; three of the patients were in the eighth month of pregnancy, but neither miscarried; one died; at the post-mortem, the fœtus was healthy.

UNIVERSITY COLLEGE HOSPITAL.

SINCE our last report seven new cases have been admitted to the cholera wards, making a total of 91. The more recent cases seem to have been of a milder type. The *Simaba Cedron*, named last week as a drug employed, has been repeated, but does not seem to have given much satisfaction. Dr. Fox has found the Botany Bay kino effectual in restraining diarrhoea. This drug, also called Australian red gum, is given in doses of twenty grains, with mucilage. It will probably come into vogue as an astringent. We may therefore say that it is the product of the *Eucalyptus Resinifera*, and is described in the recent work on materia medica of Dr. Scoresby-Jackson. The resident medical officer of this hospital (Dr. Richards) has made an appeal on behalf of the orphans of the district, to which we are glad to see the committee at the Mansion House subscribing. It is well to be prepared by such prompt action; but we think, so far as our own observation goes, that the neighbourhood of this hospital is not so likely to become a centre of infection as some others, and indeed Dr. Richards does not describe a worse condition than we are accustomed daily to see.

At GUY'S HOSPITAL several severe cases have lately been admitted, and in one or two instances death has been very rapid.

At the BELLEISLE HOSPITAL SHIP only one death has occurred since our last returns, though we hear that diarrhoea is on the increase on the river. The excellent

¹Transactions of the Royal Institution, vol. i.

arrangements of the Seamen's Hospital Society will, however, probably prove sufficient to hold it in check.

At the BETHNAL-GREEN TEMPORARY HOSPITAL 335 cases were admitted between August 20 and October 14. Of these no less than 223 were decided cases of cholera. About the usual rate of mortality has marked the disease in this institution. Dr. Sutton, who has charge of the hospital, has observed a rather larger proportion than is common of cases that have passed sanguineous motions. One such patient is now convalescent, so that the symptom must not be regarded as invariably the precursor of a fatal issue.

Proceedings of Societies.

MEDICAL SOCIETY OF LONDON.

MONDAY, OCT. 15TH, 1866.

Dr. J. C. HARE, President.

THE PRESIDENT, on taking the chair, referred to the past session of the Society as one of the most useful and interesting that had been known. Papers in every department of Medicine and Surgery had been read and discussed. The ensuing session promised to be as fruitful of good works, for already they had papers in hand of great interest, and promises of others not less valuable. He then referred to the labours of medical practitioners with respect to the treatment and prevention of cholera, and felt proud in the fact that a predecessor of his in that chair, the late Dr. Snow, had done so much for elucidating the difficult question of the predisposing cause of that formidable disease. Dr. Hare then drew a parallel between the epidemics of old times and those of recent occurrence, and showed by statistics that the diseases of modern times, which were of an epidemic character, were infinitely less fatal with respect to numbers than those of the sixteenth and seventeenth centuries.

CANCER OF THE PETROUS PORTION OF THE TEMPORAL BONE.

Mr. HINTON exhibited the petrous portion of the temporal bone of a woman who had died with cancer of the breast. The case was only interesting as affording a pathological specimen of the extent to which cancer could affect an osseous structure.

THE LATE DR. SNOW.

On the motion of Mr. P. Marshall, seconded by Mr. de Méric and supported by Dr. Camps and Mr. J. F. Clarke, a resolution was unanimously carried, authorising the President and Council, in the name of the Society, to support the application of Dr. Snow's sisters for a pension from the Civil List.

Dr. ANDREW CLARK read a paper

ON THE TREATMENT OF UNABSORBED PNEUMONIC DEPOSITS.

He began by defining the conditions of which he spoke, and showed that, though not uncommon, they were often overlooked. He then proceeded to discuss the signs and symptoms by which the presence of these deposits was to be recognised, and the difficulties incident to a correct diagnosis. The destiny of the deposits was next passed in review: he said they were absorbed; or they became contracted, hard, and tantamount to lumps of yellow tubercle; or they broke up into cavities, the case being then clinically undistinguishable from ordinary phthisis; or they issued in rare cases in the development of cancerous disease. Dr. Clark next told the history of thirteen cases which had been purposely left without treatment, in order to illustrate the natural history of the deposits, and show the relative proportions in which they became absorbed, indurated, or broken up into cavities. In these thirteen cases the deposits disappeared within five months in four; remained little altered at the end of two years in six; and went on to softening and fatal destruction of

lung within little more than a year in three. The author then considered the conditions which hastened or hindered recovery, and pointed out their bearing upon treatment. He next discussed whether, above this natural treatment, art possessed other resources by which the number of recoveries might be increased and that of untoward issues diminished; and he said that he was able by his experiments to answer the question in the affirmative. His experiments were conducted exclusively on men, and all were placed as nearly as possible under the same hygienic rules. The objects of these rules were to raise the general health to its highest point, to promote the thorough moulting of the textures, and to foster the physiological conditions favourable to active absorption and excretion. The patients were ordered to sponge every evening with tepid water; to take daily three substantial meals, in which meat, bread, milk, and eggs formed the leading constituents; to consume in the course of the day, from three to four pints of fluid, of which one should be malt; to have plenty of outdoor exercise, fresh air, and recreation; to exercise the lungs frequently by means of deep inspirations; to clothe warmly; to avoid hot crowded rooms, damp places, draughts of cold air, and worry of every kind. With these directions, common to all, the cases were treated on three different plans—the mercurial, the acid tonic, and the alkaline tonic. The mercurial plan consisted of counter-irritation and bringing the patient slowly under the influence of mercury by means of grey powder and ipecacuan; the acid tonic plan in giving quinine, or quinine and iron, with acids; the alkaline tonic plan, first, in the administration of bark, iodide of potassium, bicarbonate of potassium, and ammonia till the urine became alkaline, when this mixture was replaced by five-drop doses of the arseniate of soda; and second, in the inhalation twice a day of sprays of weak solutions of bicarbonate, chlorate, or nitrate of potash. When there was irritability of stomach, bromide of potassium replaced the iodide; and when there was anæmia calumba or quassia was substituted for bark, and five to ten grains of citrate of iron added to each dose. The author then contrasted the statistical results of the thirteen cases left to themselves with sixteen cases treated on the mercurial plan, seventeen on the tonic, and nineteen on the alkaline, and drew from them the following among other conclusions:—That art might be made of real service to nature in the recovery of these cases; that the mercurial plan was by far the worst, and the alkaline plan decidedly the best, method of treating them. The author explained the reserve with which we should adopt rules of treatment based upon mere statistical returns, and pointed out how important an element in the confirmation of their accuracy was the moral conviction of the practitioner begotten by multitudes of impressions, and growing up through multitudes of corrections and limitations. He concluded by saying that, as art had proved to be of real help to nature in the removal of pneumonic deposits, it was our duty, so long as the extent to which that help might go remained uncertain, to endeavour to determine it by therapeutical experiment.

In the discussion which ensued, Dr. Palfrey, Dr. Camps, Dr. Symes Thompson, Dr. Sansom, Dr. Broadbent, Mr. Hinton, Dr. Routh, Mr. Barnes, and Dr. Hare took part.

PATHOLOGICAL SOCIETY OF LONDON.

TUESDAY, OCT. 16TH, 1866.

Dr. PEACOCK, President.

THE new session of the above Society was opened this evening. The President, in his opening address, referred with great satisfaction to the flourishing state of the Society: in reputation, in numbers, in scientific activity, and in funds, it has hitherto had a career of progressive prosperity; and Dr. Peacock's period of office has been one of unbroken success. The new volume of Transactions is the largest and the richest volume yet published, and may challenge comparison with any other similar record in existence.

Dr. T. K. SMITH, of New York, exhibited many fine Photographs of Gunshot Fractures from the late American war.

THE PRESIDENT exhibited a specimen of Perforation of the Appendix Vermiformis in a child who died of peritonitis, with fecal abscess. There was nothing in the appendix itself to account for the abscess, but in the cæcum was a small

piece of woody matter (probably an almond-shell) and a female tricocephalus.

The PRESIDENT also showed a specimen of Disease of the Mitral Valve from a female who died soon after parturition. The heart was of large size; there was recent peritonitis; and the chordæ tendinæ of the mitral valve were torn through, so that the anterior flap passed freely into the auricle, and the opening of the valve was larger than usual. The left ventricle was large, as is common in cases of enlargement of the mitral orifice.

Mr. BRUCE brought forward a series of Gunshot Fractures, collected from the military hospitals at Dresden, to illustrate the kinds of fracture produced by the bullets used by various armies. The specimens comprised several examples of fracture, which were interesting in themselves, besides illustrating the effects of the various kinds of projectile.

Mr. DE MORGAN communicated the sequel of a case in which he had removed a recurrent Encephaloid Tumour from the orbit, the patient having remained in perfect health for about a year and a quarter, when symptoms of recurrence of the disease in the lower part of the spine took place, and he died in a few weeks. There were no cerebral symptoms, except loss of power of vision in one part of the sound eye. After death a tumour was found springing from the divided optic nerve, passing backwards, and involving the chiasma and a portion of the opposite optic nerve. The condition of the orbit operated on was peculiar, as many of the natural foramina were obliterated. There were several cancerous tumours in the spinal column, one of which ensheathed the spinal cord close to its extremity, whilst others surrounded the nerves of the cauda equina, but did not spring from the nerves. Mr. De Morgan remarked upon the support this case gives to a view which he holds upon the spread of cancer—viz., that it spreads by the mere dissemination of the cancer-matter, not by any cancerous tendency in the constitution. Had the tumour here been thoroughly removed at an earlier period the recurrence of the disease might, perhaps, have been obviated.

Mr. J. Z. LAURENCE brought forward a tumour of a malignant nature from the choroid. The eye had been lost from an old injury, and was removed as useless, with no idea that any tumour existed. The specimen was referred to Dr. W. Fox and Mr. Hulke.

Mr. LAURENCE also showed another Eyeball which he had removed as being disorganized.

Mr. MOORE exhibited a Cancerous Gland, which had been injected with acetic acid after the manner recommended by Dr. Broadbent. Mr. Moore stated that he had adopted this plan in several tumours, which have now disappeared. In the present case a cancerous tumour of the lip had been allowed to proceed to a great extent before removal. Then the disease recurred in a gland below the jaw. This was injected with acetic acid (one part to three parts of water); but much swelling followed, and the injection seemed to have failed. The parts were freely removed. The swelling was found to be due to the growth of a second gland, which had not been touched by the injection. Their condition was strikingly different. The injected gland was pulpy and withered, and showed hardly a trace of cancer-cells; while in the gland which had not been injected the cancer-cells were very numerous and well characterized.

Mr. POWER spoke of the great benefit derived from the treatment of cancer by Dr. Broadbent's method.

Dr. BROADBENT also stated that his further experience continued to be very favourable to the method which he had recommended. The tumour disappears without any process of sloughing. If sloughing be very undesirable, it is better to use a weaker acid.

Dr. MURCHISON brought forward a case of Addison's Disease from a patient of Dr. Bantock, the symptoms of which he related. They were of the usual kind, except that there was pus in the urine. On post-mortem examination there was found a deposit of tubercle beneath the lining membrane of the ureter, and the kidney was slightly dilated. No other tubercle was found, but the viscera were not minutely examined. The condition of the supra-renal capsules was that usual in Addison's disease.

Dr. MURCHISON also showed a specimen from a patient who had a large tumour in the abdomen, which was believed to be ovarian. The patient became much worn, a great secretion of pus appeared in the motions, and the tumour became resonant. After death the tumour (which was really connected with the ovary) was found to have burst freely

into the rectum. The kidneys were in a fatty condition and enlarged, and the spleen was of a well-marked waxy or amyloid degenerative character. Dr. Murchison referred to the interesting fact that two organs should display these two different kinds of degeneration.

Mr. ERNEST HART exhibited a Fibro-plastic (Melanotic) Tumour of the Eyeball, which he had removed from a middle-aged man, who had lost his sight in consequence of a chance blow on the eye from the parasol of a lady desiring to stop the omnibus of which he was conductor. After a rheumatic attack the eyeball suppurated, and it became a great disfigurement to him. The anterior part of the eyeball was removed, and an artificial eye was fitted. Then a black growth sprang from the stump, not accompanied by pain. The remains of the globe were removed, and the tumour was found to be of a fibro-plastic nature. The histological characters of the tumour were shown and described.

Dr. WILSON FOX brought forward some of the less usual lesions found in cholera patients—viz., punctiform extravasations of blood under the mucous membrane of the intestines (and some in the stomach), when the stools contained blood; large masses of extravasation in the colon; diphtheritic sloughing of the mucous membrane of the intestine; ulceration of the mucous membrane without hæmorrhage; tubercular ulceration, with tubercle in the surrounding glands, in a cholera patient who died in pregnancy, some of which were found to be cicatrising, and without any contraction of the intestine; enlargement of solitary glands in the stomach and intestines; and other preparations showing the microscopic characters of the disease.

CHOLERA.

A STILL further increase in the number of deaths from cholera is once more the burden of our report. In the forty-first week of the year ending Saturday, the 13th inst., 207 deaths from cholera, and 47 from diarrhœa, making a total of 254 from the two forms, were registered in the metropolitan districts. This, then, is the third week in which the epidemic has seemed to gain ground. Nothing could more aptly enforce the warnings that we have all along been giving.

The total mortality of the week was 1353, an excess over the estimated average, corrected for increase of population, of 131. The deaths were distributed in the districts as follows:—38 in the West; 41 in the North; 44 in the Central; 82 in the East; and 49 in the South districts. If we take the population into account, the mortality is lowest in the South and North, and highest in the Central and East districts. There are not wanting some encouraging facts in reference to the epidemic. It is true that for six weeks the deaths have been successively 289, 292, 248, 244, 251, and 254. But in the epidemic of 1854 the corresponding weeks were far more fatal. The actual numbers were 2326, 1781, 1474, 919, 509, and 351. In the epidemic of 1854, the deaths during this period thus reached the number of 7360, while in the present year they have only been 1578. Had we suffered in proportion to our larger population as severely as in 1854, there would have been 8929 deaths. The gain is clearly 7351 lives, and if we may attribute this gain to our sanitary measures, it is a triumph worth recording, as a stimulus to fresh effort and a promise that we shall yet be able to render the dreaded pest comparatively innocuous. Nevertheless, we cannot disguise from ourselves that the subsidence has been so gradual this year that it would appear as if a less violent outbreak than that of 1854, so far as intensity is concerned, was likely to prove a more enduring one. Though it cannot be maintained that the disease is less intense in individual cases, yet it has affected a smaller number of persons. Taking every point into consideration, we maintain that there is even now grave cause for uneasiness, and while all our health officers are energetically at work, we fear our sanitary authorities are relapsing into their wonted carelessness. For this reason

we are glad that the Registrar-General has resumed the publication of the daily returns, on the discontinuance of which we commented last week. It is well for the public not to be suffered to lose sight of the fact that the epidemic still levies its daily contributions in the districts of London. On Sunday and Monday, the 14th and 15th, there were 42 deaths from cholera, and 9 from diarrhœa. On Tuesday the numbers were 30, and 7 on Wednesday.

The annual rate of mortality has been 23 per 1000 in London, 24 in Edinburgh, 38 in Dublin. The mean temperature of the air for the week was 52·4 Fahr., which is 0·8 above the average for the same week in fifty years, as determined by Mr. Glashier. The range during the week was 30·4 degrees; the highest having been 66, and the lowest 35·6. For five days the wind blew from the N.E. and E.N.E. One day from the S.W.

THE RIVER.

The Seaman's Hospital Society continues its invaluable labours. Two cases have been sent to Guy's Hospital by the visitors. Cases of diarrhœa continue to occur on vessels lying in the Pool, particularly in the south side of the river, in the neighbourhood of Dockhead, Bermondsey, and Horsley-down stairs. A dépôt for dustbin refuse exists near the former locality, and this is shipped off leisurely in barges, sending forth steaming odours far and wide. Another nuisance of this kind exists on the north side of the Thames, about midway between the Tunnel Pier and the entrance to the London Docks. It is greatly to be regretted that no action is taken in these matters by the authorities of those parishes in which these foci of disease exist. Another week will probably elapse before this refuse is cleared away. Means should be provided for its more direct removal out of districts so densely populated as those on the banks of the river. The *Belleisle* Hospital still continues ready for active service, and the *Dreadnought* authorities have resolved that her working staff shall remain intact until the epidemic has actually passed away.

EDINBURGH.

A few isolated cases of cholera have occurred here in the course of the summer and autumn, and about three weeks ago a group of four fatal cases were reported from an outlying quarter of the town. During the last fortnight the attacks have been more frequent, and have occurred almost exclusively in the crowded districts of the old town; and last week, for the first time, the cholera hospital, long held in readiness, had to be opened. In the last week ten cases were reported and six deaths, following upon thirteen cases in the previous week and seven deaths. In some instances the type of the disease has been very severe, the illness lasting only two or three hours. In the course of the week the hospital has been visited by Bishop Morrell, Mr. Montgomery, and other clergymen of the Scottish Episcopal Church, while the Rev. Messrs. Rigg and Corbett have attended upon the Roman Catholic patients. Six or eight fatal cases have occurred during the week in Leith, and cases are also reported from Musselburgh and other adjacent places.

NORTH-EAST SEAPORTS.

Several cases continue to occur at these places, most of them very severe and of short duration. At North and South Shields choleraic diarrhœa continues epidemic. On Monday, the 15th, the weather, which had been dull and foggy, became clear, keen, and bracing.

THE CONTINENT.

Southern Italy is still the chief sufferer. At Palermo there is an increase, and although a somewhat less number is reported from Naples, the disease has appeared in Catania, Massa, and other elevated localities.

Reviews.

CONTRIBUTIONS TO MEDICINE AND MIDWIFERY.
By THOMAS EDWARD BEATTY, M.D., M.R.I.A., &c.,
President of the King and Queen's College of Physicians
in Ireland, &c. &c. Dublin: Fannin and Co. Pp. 651.
8vo. 1866.

WE have read this book through with pleasure; and we confidently affirm that since the publication of the late Professor Montgomery's well-known work "On the Symptoms and Signs of Pregnancy," scarcely any treatise has appeared on subjects of this kind which at all can compare with these "Contributions" of Dr. Beatty. It has every element in its favour; the result of a long professional experience, the curious interest attached to several of the subjects of discussion, the good plain English in which it is written, and the admirable "get-up" of the volume, as a specimen of Dublin typography, will, to all human certainty, obtain and secure for it the position of a standard professional work.

Not the least part of the interest attached to this volume arises from the fact that it consists of papers on a diversity of subjects connected with medicine, some written by the President's father, the late Dr. John Beatty, but for the most part contributed by the President himself at various times during his professional career to our medical periodicals, and to the "Cyclopædia of Practical Medicine."

In the preface Dr. Beatty says of his "Contributions:—"

"Some of these treat of subjects with which I confess I would wish to have my name associated—those, for instance, on the Forceps, Ergot of Rye, Chloroform, Cancer of the Uterus, and Abdominal Aneurism. With the forceps I have an hereditary connexion, for it will be perceived by the reader who honours these pages with a perusal that I have introduced an account of the part taken by my father, the late Dr. John Beatty, in restoring this valuable instrument to its proper position in this country."

The limited space at our disposal prevents our supplying anything like an analytical review of Dr. Beatty's work, and we must only content ourselves with giving the reader a general idea of the nature of its contents, leaving him to peruse the whole, or any particular paper, at his leisure. Chapter I. contains the "Observations on the Use of Instruments in cases of difficult and protracted labour," read by the late Dr. John Beatty before the Association of the College of Physicians in 1829. Chapter II. contains two other papers, one entitled "Observations on a Species of Premature Labour, to which Pregnant Women are not unfrequently liable," by the late Dr. Joseph Clarke, and the other "A Letter from Dr. Beatty" (read 1821), respecting Dr. Clarke's observations. Chapter III. contains a series of statistics from the reports of the South-Eastern Lying-in Hospital. Chapter IV. gives cases illustrative of the use of the forceps in obstetric practice. Chapter V. treats of the means of preventing uterine hæmorrhage after delivery, and on the influence of ergot of rye on the fœtus in utero. Chapter VI. discusses the use of chloroform in midwifery, in conjunction with ergot of rye and *per se*. Chapter VII. deals with purulent effusions into the joints, &c., in puerperal women. Chapter VIII. details a case of pregnancy, complicated with a tumour occupying nearly the entire pelvis. Chapter IX. treats of "a Rare and hitherto Unnoticed Form of Death in Cancer of the Uterus." Chapters X. and XI. respectively treat of retroflexion of the uterus and calculus in the female bladder, and Chapter XII. is devoted to the important question of Frottement in Peritonitis. Chapter XIII. gives a rare case, only one other case being known, of inversion of the urinary bladder through the urethra, with large prolapsus of the rectum in a female child; and Chapter XIV. gives Dr. Beatty's well-known essay on the "Diagnosis of Abdominal Aneurism," first published in 1830, and referred to by Dr.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 24, 1866.

THE PROGRESS OF CHOLERA.

WHATEVER may have been the reasons which induced the Registrar-General to discontinue the publication of the daily returns of the cases of cholera, we find, with satisfaction, that those returns have been resumed, and the results, while they show that the epidemic is not raging violently in Great Britain at the present moment, fully justify the remarks we made last week as to the necessity of furnishing ample particulars as to the number of cases and the localities where they occur. That the disease has not yet disappeared is sufficiently evident from the fact that the last weekly return indicated a mortality of 254 (207 from cholera and 47 from diarrhoea) by the existing epidemic in the metropolis, while in the previous week the mortality was 251, thus showing a small increase. Of the cases recorded during the past week, 38 occurred in the west districts, 41 in the north, 44 in the central, 82 in the east, and 49 in the south districts; thus again confirming our remarks as to the more general diffusion of the choleraic poison among the different districts, and its partial disappearance from the east district, which was, in the first instance, more especially and extensively attacked.

Although it cannot yet be alleged that we have got rid of our unwelcome visitor, still considerable consolation may be derived from the reflection that the general health of the population is good, and the mortality very little in excess of the estimate. It would appear, therefore, that if cholera could be exterminated, the mortality of the present season would be actually below the average.

It is also a subject of some gratification to compare the mortality from cholera in the present year with that which was recorded in former visitations. The deaths in London since the first week in September, 1866, have been 1578; but in the corresponding six weeks of the year 1854, the deaths from cholera and diarrhoea were 7360. The weekly number of deaths for the last six weeks in London from epidemic cholera and diarrhoea has been respectively, 289, 292, 248, 244, 251, 254; while in the corresponding weeks of 1854 the numbers were, 2326, 1781, 1474, 919, 509, and 351. The Report of the Registrar-General says that "at the cholera rates of 1854 the deaths in the last six weeks (of 1866) corrected for increase of population, would have been 8929; the deaths have been 1578. Here are 7351 lives saved."

The Report goes on to state that these results are encouraging, but it recommends that incessant attention should still be given to the disinfection of sewage of towns on the Thames and the Lea, above the intake of

Stokes, who states that to Dr. Beatty is due "our knowledge of the diagnosis of this affection." But it is not only to the general physician and to the obstetrician that Dr. Beatty's work will prove interesting. At one time he was Professor of Medical Jurisprudence in the Royal College of Surgeons of Ireland, and, accordingly, the medical jurist, especially the curious and antiquarian medical jurist, will here find valuable papers on his special science, originally contributed to the "Cyclopædia of Practical Medicine," and now revised in accordance with changes in the law. We find a chapter on rape, one on impotence, one on doubtful sex, and one on persons found drowned.

All these are worth not mere perusal, but *study*, and remembering that Dr. Beatty was formerly President of the Royal College of Surgeons, we are not surprised to find among the "contributions" in this book, an Essay on Operation for the cure of Dysmenorrhœa, and on Plastic Operations on the Female Genito-Urinary Organs. Two addresses delivered at different times before the Dublin Obstetrical Society, and an address delivered at the opening of the Winter Session at the City of Dublin Hospital, in 1865, complete this volume, which has also a good index and table of contents.

From the preface we learn that Professor Macnamara, so well known as the Editor of the Sixth Edition of "Neligan's Medicines," has superintended the passage of the work through the press; of him the writer of the book observes—"He has devoted an amount of care and labour upon this volume, without which it would have been impossible for me to have completed the task." Are we asked to give special prominence to what we consider the best parts of Dr. Beatty's work? If so, we may draw the attention of the obstetrician to Chapters I. and II., containing Dr. John Beatty's papers; and to Chapter IV., containing cases illustrative of the use of the forceps. To those who specially study diseases of women, Chapter IX.—"On a Rare and hitherto Unnoticed Form of Death in Cancer of the Uterus"—cannot fail to prove instructive, illustrated as it is by a first-class coloured engraving.

The physician proper (if we may coin a title) should read Chapter XIV., "On Aneurism of the Abdominal Aorta." Apart from the originality of Dr. Beatty's remarks, the thrilling interest attached to this narrative of an amount of human suffering and patience which has seldom been equalled, cannot fail to strike a cord in every heart. The attention of the medical jurist may be advantageously given to the contents of Chapters XV. on impotence; XVI. on rape; XVII. on doubtful sex, and XVIII. on persons found drowned. It is but common justice to say that in these chapters there is much learning and no pedantry.

From what we have already written, it is needless to observe that we heartily commend Dr. Beatty's work to the profession; and while we wish him long life, we cannot but think that long after he has been gathered to his fathers, his "Contributions to Medicine and Midwifery" will be consulted by the practical physician and the obstetrician, and will be quoted by the advocate and the medical jurist.

TO CONTRIBUTORS.

COMPLAINTS occasionally reach us from contributors that corrections made by them in proofs have not been duly inserted in their papers. This is owing to the fact that the contributors in question do not return their proofs until the sheets have been printed. Corrected proofs should reach the printer by Saturday evening, or by Monday morning at latest. Last week some proofs did not reach us until Tuesday night.

the London Water Companies, and it suggests that the engineers should devise some plan for the effectual filtration of the London waters.

We believe that it is not at all unreasonable to suppose that the epidemic of the present year has been in great measure kept in check by the vigilant exertions of the Medical Officers in each district, and the report of the Registrar-General affirms as the result of experience that the destruction of the cholera poison is scarcely ever effected in bad districts unless when it is carried out under the eyes of medical visitors, while in the absence of such supervision the premonitory diarrhœa is too often neglected, and the danger of the whole metropolis is thus indefinitely protracted.

The fact is that, even at the risk of raising a parrot-cry, we must diligently recommend the continuance of the adoption of preventive measures as the best remedial agents yet known for the extirpation of cholera. Shallow thinkers and superficial writers have thought proper to reproach the Medical Profession because it cannot proclaim an infallible cure for all known diseases, entirely overlooking the fact that it is the province of quackery, not of legitimate medicine, to boast of the efficacy of specifics. For some maladies to which the human frame is subject science has not yet discovered an unfailing remedy, and cholera may, for the present at least, be admitted to be among the number. But neither has Medicine discovered a remedy for small-pox, although the ravages of that disease have been most materially diminished, and its mortality immeasurably reduced, by the practice of vaccination. So, it is fair to suppose that the mortality of cholera may be, and has been controlled and diminished by careful attention to those sanitary laws which the experience of the past and present epidemics has served to establish; and although the services rendered by Medicine may be often powerless in the presence of fully-developed attacks of the malady, yet its province in removing the germs of disease or in combating the early symptoms is even more beneficially manifested than it would be in wielding the armamentarium of the *Materia Medica* in the case of patients struck down by imbibing a pernicious dose of the mysterious and fatal poison. Whatever the poison of cholera may be, it is certainly robbed of its malignity by dilution, or perhaps neutralized altogether by segregation of patients, and the processes of disinfection, and these and other measures can be carried out only by the labours of the members of the Medical Profession, to whom the community must look up as their best friends and advisers in the hour of danger.

CLASS EXAMINATIONS AT THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

WE beg to direct attention to an important announcement concerning the Irish College of Physicians, which will be found in our advertising columns. It refers to the system of holding professional examinations by

classes, in contrast to the time-honoured plan of holding a special examination for each student.

It is scarcely necessary for us to urge on students, and on those who have the guidance of their professional training, the great advantages and the practical importance of taking examinations by halves; or, in other words, of so dividing the periods of study allotted to various subjects, that, when finally qualified, the young practitioner may be well informed on all branches of his profession.

As a general rule, this is impossible if there be but one final examination, at which everything must be answered, and for which a most exhausting and exciting preparation is demanded. Hence the current of medical opinion has now fairly set in in the direction of what may be called in university phraseology, applied to medicine, "the great go, and the little go."

To some extent allied to this is the system of periodic Class Examinations, now held at intervals both at the College of Physicians and at the College of Surgeons in Ireland.

These being held at stated intervals, and being occasions on which any number of qualified students may come up for examination together, we have no doubt of their ultimate success as an institution.

Meanwhile we may urge on students that they derive other advantages from this system, of which such as are able ought to avail themselves without delay. It gives them an immediate object to read for, and so induces, what is much wanted, a *system* of reading; and it anticipates the two years' idleness which heretofore has been the rule with those who relied on hard work during the last nine months of their course, as a sufficient preparation for one severe examination, and for the anxious duties of medical practice.

MATERIA MEDICA MUSEUM IN THE MEDICAL SCHOOL OF TRINITY COLLEGE, DUBLIN.

WE have much pleasure in calling the attention of the profession, and of intending students of the School of Physic in Ireland, to the excellent and complete museum which has been put up in the Trinity College Medical School during the past summer.

The collection is not only extensive, but, what is of more value, it is well selected, and admirably and tastefully arranged. The Board of Trinity College having placed a sufficient sum of money at the disposal of Dr. Aquilla Smith, King's Professor of *Materia Medica* and Pharmacy, that gentleman purchased specimens of the best kind, and himself arranged the entire—in fact, *made* the museum—which is in every way creditable to him, to the liberality of the Board, and to the good order and usefulness of the School of Physic.

Notes on Current Topics.

THE QUEEN ON THE PUBLIC HEALTH.

IT is not often that the doings of royalty come within the province of the medical journalist, so that we seize the opportunity of directing attention to her Majesty's late public act at Aberdeen. It is fitting that a first appearance before her people in a public capacity, since the great sorrow that has caused her Majesty's retirement, should be one calculated

to give all the influence and support of royalty to the progress of sanitary works.

On Tuesday, the 16th, the new Waterworks of Aberdeen were publicly opened by the Queen in person. These works convey to the city the third supply of water that has become necessary during the present century. In 1806 the supply was 60,000 gals.; it has been since increased to 1,000,000. The works opened by her Majesty can bring 6,000,000 gallons daily, by means of gravitation, from the river Dee.

The plans of this stupendous undertaking were by Mr. James Simpson, C.E., of London, and the works have been executed by Mr. E. Gibb, under the superintendence of Mr. R. Anderson, C.E.

The description of the opening ceremony, the Queen's weather, which shone again upon her Majesty, and the enthusiastic reception offered by her loyal people, are none of them suitable topics for our columns. But we may place upon record the words in which the Queen replied to the address presented to her. Speaking in public for the first time in her official capacity since the death of the Prince Consort, her Majesty said:—

"I thank you for your dutiful address, and am very sensible of this fresh mark of the loyal attachment of my neighbours, the people of Aberdeen. I have felt that at a time when the attention of the country has been so anxiously directed to the state of the public health, it was right that I should make an exertion to testify my sense of the importance of a work so well calculated as this to promote the health and comfort of your ancient city."

Let the words be echoed through the length and breadth of the land.

HOW CHOLERA COMES ON BOARD OUR MERCHANT VESSELS.

At a meeting of the Sanitary Committee of the Corporation of Dublin, on the 9th inst., a report was submitted on the case of the ship *Olive*, which had sailed from Liverpool on the Friday previous, and the captain and mate of which had died of cholera in the Mater Misericordiae Hospital shortly after her arrival. The water of the ship had been analyzed by Professor Cameron, and resembled common ditch-water. It abounded in animal and vegetable life, many of the animal forms being visible to the naked eye. Both the victims had drunk freely of this water. It may, therefore, be worth while to record its qualities with more precision:—

"Cyclops quadricornis could easily be seen darting about with great velocity in search of their prey, the smaller animals contained in the impure water. One imperial pint of this water was found to contain 1.25 grains of organic matter, or at the rate of ten grains per gallon. By way of contrast, I may mention that the Thames water at London Bridge contains less than three grains of organic matter per gallon. Ships are the great carriers of the virus of the epidemic diseases of foreign origin. These maladies invariably make their first appearance at seaport towns. It would, therefore, be a matter of great importance to induce or compel the owners of vessels to pay more attention to the quality of the water supplied to their ships. It is a disgrace to some person that the water stored in the *Olive* should be of such quality, since the vessel came straight from Liverpool to Dublin."

THE PRIVY COUNCIL'S INQUIRY INTO THE EPIDEMIC.

It was announced some weeks ago that a sum of money would be granted to Mr. Simon, to enable him to institute a full scientific investigation into the recent outbreak of cholera in the metropolis, and the names of some very

competent men were freely mentioned as likely to take part in the inquiry. A little later we heard that so munificent a sum as £500 would be allotted towards the expense of a thorough scrutiny into the origin of an epidemic which has slain so many thousands of human beings. Of course these were of much less value than cattle—hence the thousands lavished on the cattle plague inquiry, and the trifle offered to the doctors to investigate cholera. But will even this be done? The last we hear of the matter is that Mr. J. N. Radcliffe has been instructed to prepare a report on the subject. Mr. Radcliffe will, we doubt not, discharge this duty with the ability and care he has before exhibited in similar labours, but were we not promised a commission? Mr. Radcliffe would be an excellent member of a commission but others ought to be associated with him. Surely a few hundreds could be spared for such a purpose.

POOR-LAW GUARDIANS AND THEIR MEDICAL OFFICERS.

THE practical result of the humane exertions made by many of the Poor-law Medical Officers of Workhouses to improve the condition of the sick poor has been the proposal of measures which will necessitate the resignation of many of those gentlemen. It will be recollected that among the deficiencies complained of in the present management of the sick poor in the workhouses was the want of Resident Medical Officers to attend day and night upon the patients, and none have passed the necessity of supplying this want more than the Poor-law Medical Officers themselves. The Guardians, therefore, while pretending to accede to the general feeling on this subject have in certain instances hit upon an ingenious plan to benefit the sick poor, and at the same time to procure the removal of the present Poor-law Medical Officers who have themselves been appointed Resident Medical Officers. The consequence is that the surgeons so appointed must relinquish their private practice and reside in the workhouse, or they must resign their Poor-law appointments. The scheme is most amusing for its simplicity, and we have been informed that Dr. Rogers, of the Strand Union, is one of the first victims on whom its efficacy is to be tried. The question has been actually proposed to the Guardians, but has not yet been carried.

THE THAMES PURIFICATION ACT, 1866.

THIS Act, passed in the late Session, has just been printed and provides for the purification of the river Thames by the diversion therefrom of the sewage of Oxford, Reading, Kingston, Richmond, Twickenham, Isleworth, and Brentford, and for the collection and utilization of the sewage, and for other purposes. The preamble recites that, under existing arrangements, the sewage of towns situate on the river Thames above the metropolis is carried into the river, and thereby the waters of the river are polluted and the health and comfort of the inhabitants of the valley of the river below those towns and of the metropolis are affected. Furthermore, it declares that it would be of great local and public advantage if sewage were diverted from the river, and that it is expedient that several corporations and other governing bodies of the several towns upon and in the neighbourhood of the river should be empowered to enter into contracts and agreements for the disposal of the sewage of the towns. That the sewage, if diverted from the river and collected, might be utilized and purified

cation might be utilized for the fertilization of land by irrigation or otherwise. That the persons in the Act named, and others, are willing to undertake at their own expense the diversion from the river of the sewage of the towns mentioned on being incorporated and enabled to collect the sewage and utilize it, and for that purpose to construct conduits, reservoirs, and works. The position of the conduit, pipe, or main which is intended to convey the water under and across the Thames at Richmond is to be defined upon a plan to be approved by the Conservators of the river before the works are commenced, and the works in the river and adjoining are to be done and performed to the satisfaction of the engineer of the Conservators, and the conduit, pipe, or main is to be laid at such a depth in the bed of the river as will allow of the ground or soil over the conduit or main to be dredged to the depth of 16 feet under high water, Trinity standard, and the traffic on the river is not to be interrupted more than may be absolutely necessary for the performance of the works. Special clauses have been framed for the protection of the Great Western and London and South-Western Railways. There are likewise provisions in the Act for the protection of waterworks. The conduit, reservoirs, and the works authorised by the Act are to be constructed and kept so as not to be or to create a nuisance, or to be injurious to health. Nothing in the Act is to exonerate the parties carrying it out from an indictment, action, or other proceeding for a nuisance, or for damages caused from the operation or want of repair of any of their works.

LET US PROGRESS.

CERTAINLY. Why should we yield to absurd prejudices about modesty and all that sort of thing? Or why submit to extinct conventionalities of dress, unworthy of the character of a "go-a-head," free, and independent people? How much more edifying than the everlasting crinolines and long clothes was the smart figure of Dr. Mary Walker, at the Social Science Congress, in bloomer costume, with black unmentionables, fitting tight at the ankle, and a medal for American war service, decorating the exuberant rotundity of her manly breast. And how preferable to the obsolete prudery of the daughter of that slow old coach, John Bull, the out-spoken sentiments of Dr. Mary, who suggested that there need be no such thing as infanticide if people were not so ridiculous as to regard the loss of female virtue as a social stain. Down with all husbands! Are we not women and brothers? Let's liquor up!!!

POOLE DEFENCE FUND.

THE monthly meeting of the Committee was held on Saturday week—the chair being occupied by Dr. Johnston, of the Cork Military Prison, in the unavoidable absence of both President and Vice-President.

After the transaction of much routine business, the "Poole Defence Fund" was entered on, and considerable gratification expressed at the manly response made by the profession to the *principle* involved in the appeal.

It was arranged (by desire) that the subscription list be not yet closed, and a hope expressed that those gentlemen, whose names are recorded as promised contributors, would send in their subscriptions to the Honorary Secretaries with as little delay as convenient.

CARBOLIC ACID AND STREET DISINFECTION.

WE see that the Corporation is now using carbolic acid in the streets of Dublin. We hope that this, in conjunction with the other means adopted—viz., better supervision of nuisances, &c., will prove successful in eradicating the epidemic. So much has been written within the last four or five months by Mr. Tichborne, in the pages of this journal, upon the use of carbolic acid as an antiseptic, that it would be superfluous to enter into its properties here. It should be borne in mind, however, that it is not a deodorizer, but an antiseptic in the strictest sense of the term, and in this respect it is said to be the most powerful one known.

Correspondence.

A NEW APPARATUS FOR FRACTURES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly allot me a small space in the columns of your periodical to bring before the notice of my professional brethren a new description of apparatus to obviate bandaging in fractures of the humerus, and (for I see no reason why the same principle should not be equally serviceable) in fractures of some of the other long bones. I recommend this cylindrical splint with great confidence, possessing, as it really does, the following advantages over the present fashioned splints and bandages, in the application and re-application of which oftentimes much pain is given, and, as too frequently happens, the fractured ends of the bone are disturbed, and sometimes again displaced, and occasionally union completely prevented by this unnecessary interference. Firstly, it is more easily applied; secondly, it gives no pain, as bandages frequently do, from contraction, when wetted, or when, after setting, the arm swells; thirdly, it is a great saving of time to the surgeon; fourthly, it retains the fractured extremities of the bone in the closest apposition; and, fifthly, when once properly applied, it requires no further attention on the part of the surgeon, except regulation of the pressure by means of the thumb-screws, until complete consolidation is effected. Of course I am now speaking of simple fractures, but even in cases of compound fracture (in which perhaps the cylinder would be alone required), I cannot see that there would be any necessity for removing the apparatus, the only thing needed then being an oval or circular opening made in it, corresponding to the site of the wound, which could then be watched and dressed without at all disturbing the injured bone.

Having used this apparatus in only one case, in which it more than realised my expectation, I present it to my readers for what it is worth. It is of such simple construction, so easily applied, and affords a saving of so much time to the surgeon, in addition to its other merits, that I think it well worthy a further trial, and I shall be glad to learn from any one adopting it the result of their experience.

William Horton, of Shirley Heath, aged 67, a man of weak intellect and of feeble constitution, slipped down on some loose stones on the 5th day of August last, and sustained an oblique fracture through the lower third of the shaft of the left humerus. I applied this apparatus in the manner stated below, and although the arm, forearm, and hand were much swollen, and in considerable pain, as soon as the splint was applied and the pressure properly regulated by the thumb-screws immediate relief was given, and the pain decreased as the swelling subsided, the splint being proportionately tightened.

From its first application on the 5th of August till the

10th of September the splint was never removed, or, consequently, the fractured bone disturbed, and upon examining the arm this day (thirty-six days after the accident), I found

the union perfectly consolidated. My patient also expressed himself as feeling able to move and use that hand and arm almost as well as the other. The splint I use is figured below.

It is made of two pieces of thin copper metal japanned, and measuring, longitudinally, eight inches. Each piece is moulded upon a wooden roller, three and a half inches in diameter, into a half cylinder, leaving a flank three-fourths of an inch wide on each side, and into one of these pieces three brass thumb-screws are fixed into each flank, and holes made in the counter-flank to receive the screws, so that when fixed together they form a complete cylinder three and a half inches in diameter. Over each screw, and between the plates, are several thick india-rubber rings to equalise the pressure, and the way I adjust it is this:—Having reduced the fracture, I, firstly, apply two thin and unusually wide common hinge-splints, well padded with sheet cotton wool, the one extending from the great tuberosity to the external condyle, the other from the margin of the axilla to the internal condyle. I then apply separately each half of the cylinder upon the wooden splints, and bring them together by turning the thumb-screws. The arm will then be found to be almost surrounded by splint, and the fractured bone immovable. Care should be taken that the wooden hinge splints extends an inch, or nearly so, both above and below the cylinder. The forearm and hand must be well supported in a sling, and directions given the patient to slacken the screws should the arm swell and become painful. In conclusion, I would direct attention to one of the most important advantages of my improvement, which is, that, when properly applied, there can be no pressure on the blood vessels in and about the triangular space at the bend of the arm.—Believe me, Sir, yours faithfully,

EDWARD SUTTON PAGE, L.F.P.S.Glasg., Lic. in Mid.
Solihull, Warwickshire, Oct. 10, 1866.

EDUCATED WIDWIVES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I send you my report of the Hospitals of the Longford Union for the last year. You will see in the latter part of it that I have directed the attention of the guardians to the necessity of having intelligent educated midwives in the different dispensary districts. I was induced to do so in consequence of having heard of two women dying undelivered in this neighbourhood a few days previous, owing to the ignorant old women in attendance as midwives not having given warning in time to have medical assistance; in fact, the great majority of those acting as midwives in this and the neighbouring counties are so thoroughly ignorant that they are quite incapable of distinguishing between natural and complicated labour—hence the great loss of women and children in childbed. Since the date of my report there have been two more women lost in childbed. After they had been ill some days doctors were called in, but the poor creatures were

so worn out by long suffering and hæmorrhage, that they died soon after delivery.

Alas! this is no new or transitory occurrence. Such cases as I have now mentioned have been occurring since I got charge of the hospitals of this union, over twenty-five years. In two or three of my annual reports (which appeared in the *MEDICAL PRESS*) I urged the guardians and others having influence over the poor to try and induce poor women to come into hospital, where they would have the advantage of the constant attention of a competent nurse, and timely surgical assistance, if necessary. During the last year all the lying-in women confined in hospital made good and rapid recoveries, and there was but one stillborn child.

It may be asked, where are educated midwives to be had? From all parts of the country, if they will be received as pupils in the metropolitan hospitals on moderate terms. Though the law of the land authorises Grand Juries to present for the expenses of educating midwives, it is very rarely done, except, in the thrifty North of Ireland, where their intelligence and humanity equal their industry and frugality; there they generously provide competent midwives for the poor. As it is not probable that the humanity of the North will extend westward and southward with the rapidity of the cholera or rinderpest, it would be well if the governors and committees of the Rotunda, the Coombe, Steevens', and other hospitals having lying-in wards would make some reduction in the scale of pupilage fees in favour of intelligent well-conducted poor women, recommended by medical men, clergymen, and magistrates, as proper trustworthy persons, not likely to abuse the advantages conferred on them.

I have no doubt but that splendid institution, the Rotunda Hospital, the first and best of the kind in Europe, will, in the spirit of its founder, the great and immortal Moss, be the first to open its portals to disseminate through the country the incalculable blessing of well-educated and enlightened midwives.

God grant that this may meet the eye of some benevolent medical man, a governor of some lying-in hospital, or a member of the Queen's Institute for Providing Employment for Educated Women. Now that it has become fashionable for ladies to attend the male wards of surgical hospitals, perhaps some of them would extend their kind hands to their poor sisters through the country, when enduring that severest of trials, the pangs of labour.

An appeal from the Queen's Institute would be likely to be attended with success.—I am, dear Sir, your very obedient,

S. NICOLLS, M.D.

Longford, 14th October, 1866.

"MEDICAL REPORT.

"MY LORDS AND GENTLEMEN,—I beg to submit to you my report for the year ended 29th ult., which, I am glad, shows this establishment is in a satisfactory condition.

" FEVER HOSPITAL.

" Remained, 0; admitted—interns, 10, externs, 41; 51—of whom 43 recovered, 6 died, and 2 remained. Of the deaths, one was a girl, aged 10 years, who, when recovering from fever, was attacked with pneumonia, of which she died; one was a girl, aged 18 years, she was recovering from fever when diarrhœa set in, of which she died; one was a woman, aged 33, a wandering mendicant, brought in speechless and unconscious; she died thirty-six hours after her admission. There were also three men of very intemperate habits; one was suffering from hectic and diarrhœa, the result of a chronic abscess; one was a rambling tinker, speechless and unconscious when admitted; another a pensioner, in delirium tremens, of which he died; so that, in reality, there were but two deaths from fever, and those were unconscious and speechless, and died shortly after their admission. I continue the non-alcoholic treatment, which for the last eighteen years I have found most successful.

" INFIRMARY.

" Remained, 60; admitted—interns, 491, externs, 272; 823—recovered, 737; died, 45; remaining, 41; 823. Of the deaths, 13 were children not exceeding three years, and 8 between three years and sixty years, 24 were sixty years and upwards. Of the cases treated in the infirmary many were serious surgical and midwifery, which all made good recoveries. I beg again most respectfully to direct your attention to the great necessity of having duly-educated midwives in the different dispensary districts. I frequently hear of women and children being lost through the ignorance of the ordinary midwives.—I am, my Lords and Gentlemen, your most obedient,

" S. NICOLLS, M.D., Medical Officer.

" To the Chairman and Guardians of the Longford Union.

" October 10, 1886."

OZONE AS A SANITARY AGENT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your journal of May 2nd, 1886, you make allusion to some of Dr. Richardson's recent discoveries in the following words: "An ozonized ether when injected into an apartment in the form of spray, renders the atmosphere pure, and the presence of the ozone can be demonstrated by Schönbein's test papers."

Will you kindly allow me, through the medium of your widely circulated journal, the opportunity of claiming priority over Dr. Richardson, not only in the above-named simple and efficient method of rendering the atmosphere of an apartment pure, but also in the more general application of ozonized ether to sanitary purposes.

I rest my claim to priority on the following extract from a paper written by me on the physiological effects of ozone, which Dr. Neild, Professor of Forensic Medicine, at the Melbourne University, did me the honour to read before the Medical Society of Victoria at their November meeting. This paper was published in December, 1865, in the *Australian Medical Journal*, a copy of which I forwarded to Dr. Richardson within a few days of its issue. The following is the extract:—

"By the September mail I sent a short paper to the *Lancet*, on the application of ozone to sanitary purposes, in which I recommended the use of ozone, artificially generated by ether, for the purpose of giving to hospitals, factories, &c., the normal amount of atmospheric ozone, about one ten thousandth part. I believe its use might be made the means of preventing pyæmia, hospital gangrene, and other consequences of impure air. I think it would be specially serviceable in lying-in establishments. Sheets, bedding, clothing, lint, carded cotton, bandages, paper, and many other substances may be ozonized, and thus rendered active disinfectants by sprinkling a few drops of ozonized ether over them.

"Before I ozonize a patient's room, I always ascertain the necessity for doing so by the use of the permanganate of potash test, first recommended, I believe, by Dr. Angus Smith. By this means the relative purity of the atmosphere can be readily obtained. The use of one of Rimmel's rafraichisseurs I have found to answer the purpose very well,

when I have been anxious to rapidly diffuse ozonized ether through the atmosphere of a room."

The paper I refer to as having been sent to the *Lancet* by the September mail, though acknowledged on the 25th of November, was not published till the 3rd of February.—I am, Sir, your obedient servant,

JOHN DAF, M.D.

Geelong, Victoria, July, 1886.

ON THE PROPHYLAXIS OF ASIATIC CHOLERA BY MEANS OF DILUTE SULPHURIC ACID.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am kindly favoured with copy from the *Philadelphia Reporter* of remarks on my introduction of dilute sulphuric acid as a prophylactic in cholera. After I had placed the inmates of the Belfast District Asylum, numbering at the time, I believe, nearly four hundred souls, under the sulphuric acid regimen, no further cases of the malady ensued. All the current cases of diarrhœa did well. None of them passed into algid cholera. My intention now is to show, and, so far as the above remarkable circumstance can be taken in proof, to prove that Asiatic cholera, in the vast majority of instances, or possibly in all instances, may be arrested during the period of incubation, and before diarrhœa even has set in, by the exhibition, once or twice daily, of a drachm or half a drachm of the dilute sulphuric acid in a draught of plain or peppermint water. If the proposition which I here set forth be correct, or even proximately correct—namely, the Asiatic cholera may be invariably arrested while as yet in the hatching or incubation period, its importance is momentous in the extreme. I myself am assured that, coupled with ordinary sanitary observances, dilute sulphuric acid has this power. Few out of India can have had a larger experience of Asiatic cholera than I have had. I consider that I am in a position, if any one be so, to urge this matter upon the attention of the profession. And I entreat, most earnestly, every one, who may be afforded an opportunity, to put the matter to the test. The exhibition of the dilute acid is attended with no risk or inconveniences whatever. It is calculated to inspire the utmost confidence. And I firmly believe, in virtue of the unity of life and organisation, that, literally and truly, it places in our hands the power of rescuing millions.—Yours, &c.,

HENRY MACCORMAC, M.D.

THE CONTAGIOUSNESS OF CHOLERA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—The following facts, in my mind, are quite conclusive on the question of the infectiousness or contagiousness of cholera:—

I was called out at nine o'clock A.M. on Sunday, 7th Oct., to visit a young woman in my district who was attacked with cholera at 6:30 A.M. I found her with all the symptoms well developed, and immediately gave her medicine which I carry about me in cholera epidemics. Her infant, aged about seven months, was in the same bed with her, and was, as I was afterwards informed, suckled by her as long as she had milk in her breasts. Before I left the house the family directed my attention to her little boy, aged two years and ten months, who had diarrhœa for some days. He appeared to be very unwell, and was getting that peculiar expression of countenance designated "Facies Cholericæ." I ordered him to be wrapped in warm blankets, put to bed, and to have a little brandy occasionally, and mother and son to take the medicines prescribed as directed. At my second visit (one o'clock P.M.) I found them both much worse, and far advanced in the stage of collapse. They both died at 3:30 P.M., in two hours after my second visit.

The infant, who sucked this young woman, and was in the same bed with her during her illness, has been and is at the present time in good health.

As this case needs no comment, I will leave it to my medical brethren to draw their own conclusions, and remain, dear Sir, yours,

GEORGE BRASSINGTON, L.K.Q.C.P. & F.R.C.S.I.,
Medical Officer, Rathmines.

18th October, 1866.

THE ELEMENTS OF MUTTON SUET.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read with much surprise a statement in the second part of Dr. Ogle's Lecture, contained in your number of October 17, to the effect that Chevreul, a French chemist, has recently found the existence of no less than *twenty-nine distinct elements in mutton suet*. In the ninth edition of Fownes's "Manual," published in 1863, p. 115, a list of sixty-four elements is given. Will Dr. Ogle kindly inform us which of these sixty-four constitute the twenty-nine occurring in suet? The discovery is so remarkable that it is more probably due to Dr. Ogle than to Chevreul.—Faithfully yours,

A CHEMICAL STUDENT.

SUCTION OPERATIONS FOR CATARACT.

TO THE EDITOR OF THE BRITISH MEDICAL JOURNAL.

SIR,—The letters of Messrs. H. Greenway and W. P. Swain, in the last number of the *Journal*, headed "Recent Improvements in Surgery," remind me that "suction-instruments" (of a kind) for the "removal of cataracts" have been for generations in use, though not, perhaps, in Great Britain, nor in Europe.

The Cingalese (native) surgeons have been in the habit, from time immemorial, of employing suction by the mouth in the removal of cataracts, hard and soft.

The mode of operating—as described to me some twenty years since by a native practitioner then residing near Colombo—is this:—The patient being placed in the semi-recumbent posture on a couch or sofa, the surgeon, standing at the head, rests, simply, the cutting part of the knife—which is of a rude triangular shape, becoming broader and broader as it reaches what may be called the apex of the instrument—on the cornea, and (strange though it seems) directly in front of the pupil. The mere weight of the knife opens the anterior chamber; when, on the escape of the aqueous fluid, the operator applies his mouth over the eye and sucks up the cataract.

I may add that medical practitioners (Cingalese) called now and then at the Colombo General Dispensary, to witness my own operations for cataract—performed, as they were, in the ordinary way—with the view only of comparing with them their own modes of manipulation and extraction of the opaque lens—or, what is the same thing, their own not recent but old-fashioned practice.

Apropos to this matter, permit me to quote these words from the admirable address delivered, a few weeks since, at Edinburgh, before the Medico-Psychological Association, by Dr. W. A. F. Browne:—"The study of the literature of medicine has become absolutely imperative, were it for nothing else than to prevent re-discoveries, and the prosecution of inquiries long since exhausted."—I am, &c.,

JAS. GEO. DAVEY, M.D.

Northwoods, near Bristol, Oct. 8th, 1866.

Medical Obituary Notices.

THE LATE WM. MADDEN, Esq., M.D., GOVERNOR OF THE APOTHECARIES' HALL OF IRELAND.

WE last week briefly announced the sudden decease, at the advanced age of 81 years, of the above estimable gentleman, at the time of his death probably the oldest medical practitioner in Dublin. Dr. Madden was, we believe, the last survivor of those medical students who attended the lectures of the late Sir Philip Crampton in the school established by him at the rear of his house in Dawson-street. He obtained the licence of the Apothecaries' Hall in 1812, and was subsequently for upwards of forty-seven years a member of the Court of Examiners of that body, having on five or six different occasions been elected to the office of governor, to which he was for the last time chosen on the 1st of August in the present year. By his professional brethren and the public he was highly respected, and during a great portion of his life he enjoyed an extensive practice.

Dr. Madden was remarkable for energy and activity in every department of life. He was for fifty-two years a member of the congregation now meeting for worship in the Presbyterian Church on Ormond-quay, and was foremost in every good work undertaken in connection therewith. In his charities he was liberal and unostentatious; many a family in deep distress has had a comfortable meal sent home to them, and never known the source whence their wants were supplied. His funeral was largely attended, and on the route from his residence in Blackhall-street to Mount Jerome Cemetery it stopped at the church just mentioned, where an address was delivered by the Rev. Mr. Black to a large assemblage, composed of members of several denominations of Christians. On this occasion the pulpit, galleries, &c., were draped in black, and the orphan children, so long the objects of the tender care of him whose removal they now bewailed, were clad in deep mourning. Well did the minister choose for the theme of the address above referred to, and from which some of the foregoing particulars are taken, the words: "Blessed are the dead which die in the Lord, for they rest from their labours and their works do follow them."

DEATH OF DR. GLASCOTT RICHARD SYMES.

IT is our sad duty to record the death of Dr. Glascott Richard Symes, which took place at his residence in Dublin on Wednesday, October 10, of rheumatic fever, at the early age of twenty-nine. In him the Irish School of Surgery has lost one of the most promising and talented of her younger sons; the kindness and generosity of his disposition endeared him to all who came in contact with him, while his high intellectual attainments, coupled with untiring zeal and love for the real work of his profession, soon marked him for a prominent position in its ranks.

Educated in Trinity College, Dublin, he laid a solid foundation for his future success, having obtained a Moderatorship in Experimental Physics. As a student in medicine, he was distinguished for great ability and unwearied application, which won from him the gold medal of the Pathological Society, for an elaborate and practical essay on the diseases of the breast. Shortly after he obtained his qualification, Dr. Symes was appointed Resident Surgeon to the Adelaide Hospital. On the establishment of the Medical School at Dr. Steevens' Hospital, where he had received his practical education, he was nominated Curator of the Museum and Anatomical Demonstrator, which office he discharged with the highest efficiency, until the post of Resident Surgeon falling vacant, he was promoted thereto, and subse-

UNIVERSITY OF ABERDEEN.—Drs. David Fiddes, Wm. Henderson, and Wm. Keith have been elected Examiners for Graduation in Medicine for 1866-7; and Dr. David D. Brown has been appointed Assistant to the Professor of Materia Medica and Medical Jurisprudence.

quently was elected Assistant-Surgeon to the hospital and Lecturer on Practical Anatomy in its Medical School. As a teacher Dr. Symes was respected and beloved by his pupils to whom he communicated his ideas in a clear forcible and pleasing style. As an hospital surgeon he entered on his work with all the ardour and enthusiasm of a fresh and vigorous mind engaged in the pursuit of a profession to which he was devotedly attached. His contributions to the literature of surgery, consisting chiefly of clinical reports, proved him to be a bold and intrepid, yet a thoughtful surgeon. As a reviewer, he was keenly critical and searching, but the natural gentleness and amiability of his disposition rendered his criticism free from any approach to harshness or invective. Dr. Symes was the inventor of a simple but ingenious instrument for opening tonsillitic abscess, and a splint of much value in the treatment of complicated fractures of the leg. He has left a wife and three children to mourn his irreparable loss—a loss which will be participated by his sorrowing friends, his pupils, and his colleagues.

MEAT PRESERVATION.

A NEW process of salting has lately been introduced by a Mr. Williams, long resident in South America, which promises admirable results. Instead of the clumsy old method of cutting the flesh into slices, he drives brine with great force through the circulatory system, forcing out the blood before it. In ten minutes an ox can be thus salted, the brine so thoroughly penetrating every capillary of the carcass that "a few seconds suffice for the brine to infuse the whole body; when by cutting the ear or hoof of the animal a stream of a clear pure brine untainted by a single particle of blood will naturally be seen to flow." So says her Majesty's Consul, Mr. Ford, in his report to Lord Clarendon. The advantage of this process is that none of the nourishing qualities of the meat are carried away by the salt. Large quantities of this beef have been introduced into Liverpool, and met with an instant sale.

But there can be little doubt that even the best salted meat will receive no universal welcome from Britons. We are not living in a permanent state of siege, and therefore will not put up with siege provisions. It is therefore with lively interest that we are informed that prime South American beef and mutton is now brought uncooked in joints, as cut from the animal. How this can be accomplished, considering that it has to traverse 6000 miles of ocean, or to cross the line, seems a puzzle. The dinner in the City the other day, at which the guests were regaled upon the first meat so imported into this country, afforded a satisfactory proof that the problem of preservation is now in the way of being solved. The dishes were excellent, and if there was any perceptible flavour which puzzled the critical taste, it was ascribable to the fact that the tins in which the meat was packed were lined with pine wood, which imparted a slightly resinous taste to it. Poplar wood, we are informed, which is quite tasteless, will in future be substituted. The method by which the meat is preserved in its fresh state is simply the abstraction of the oxygen from the tin case in which it is hermetically sealed. This is done in a very ingenious manner. The oxygen is driven out by water, which is poured into the tin from below, and pushes the air before it through an aperture at the top. At the moment it is all expelled the water is drawn off again, and a non-oxidizable gas, the nature of which is a secret, follows and fills the canister, which is then soldered down. As long as the canister remains intact, the meat remains perfectly fresh, and, what is of great consequence, it remains so for a longer time after it has been opened than fresh beef will keep in this country. The meat can be dressed in any manner, exactly as we dress home-grown beef and mutton. The value of this principle of arresting putrefaction has long been recognised and indeed put in practice. We bring salmon and lobsters from Norway packed in ice, and the preserved cooked meats supplied to the navy are defended against decomposition by the withdrawal of oxygen from the packing-cases; but Messrs. Sloper and Paris, who have patented the South American process, are

the first to show the practicability of moving the undressed carcass from one side of the globe to the other without in the least deteriorating its quality. If we can do this with beef and mutton, we can do it with every other kind of flesh. Wallachia and Moldavia, where flocks and herds roam in vast quantities, may be drawn upon for our home supply; in short, wherever there is abundance of animal life and water carriage is at hand, there we may look for our supplies. England has long ceased to depend upon our own fields for grain crops, and she must go afield for her meat supply. What butcher would have believed a dozen years ago that Holland would send us joints of beef and mutton to market? But they may be seen at Newgate Market any morning, and when the temperature is moderately low they bear the voyage very well; the prices ranging from 5d. to 7d. per pound.

Notices to Correspondents.

A Chemical Student.—The letter is inserted.

The Pharmaceutical Society of Great Britain.—The list is inserted.

Mr. Maxwell.—If possible in our next.

Communications received:—Obituaries of Drs. Snow and Barlow. We hope to publish them in our next.

Dr. Scott, Aghnacloy.—We regret that we do not represent your opinions on the question. We are anxious to give a full hearing to every side, and our columns are open to you.

Medical News.

THE QUEEN'S UNIVERSITY IN IRELAND.—At the annual public meeting of the Queen's University in Ireland to confer degrees, the following degrees, diplomas, and certificates were conferred:—

The Degree of M.D.

Third Class—George Gray, Belfast.

Unclassed—John Albert Anderson, Belfast; Henry Schofield Baldwin, Galway and Belfast; Thomas Carmichael, Belfast; Thompson R. Clarke, Galway; Thomas St. John Clerke, Cork; William Collins, Cork; James Conolly, B.A., Galway; John Kelly Conway, Galway; John Snow Allen Cunningham, Galway; George McBride Davis, Belfast; James Reid Dickson, Belfast; George J. Gibson, Cork; Anthony Gorham, Galway; Joseph Reay Greene, Honoris Causa; Alexander Heron, B.A., Belfast; John F. Hodges, M.D., Honoris Causa; David Johnston, Belfast; Robert Peel McAlevy, Belfast; Frederick McClement, Belfast; John McCaulay, Belfast; Newenham Maher, Galway; Hickman Morgan, Cork; Andrew Mullan, M.A., Belfast and Cork; Edwin Field Nelson, Belfast; John O'Connor, Cork; William Arthur O'Connor, Cork; Daniel O'Connor, Cork; Samuel Parke, Belfast; Robert Vincent Power, B.A., Cork; James Hutton Ritchie, Belfast; John Ralph Ross, B.A., Galway and Belfast; James Edwd. Saunderson, B.A., Galway; William Sharpe, Belfast and Galway; William Stephens, Galway; William Thornley Stoker, Galway; Edmund Townsend, B.A., Cork; William Henry Warren, Galway; George Vesey Wood, Galway, Cork, and Belfast; William Wylie, Belfast; Alexander Young, Belfast.

For the Degree of M.Ch.

Thompson R. Clarke, Galway; William Collins, Cork; George J. Gibson, Cork; George McBride Davis, Belfast; Barry Delaney, M.D., Cork; Alex. Filson, B.A., M.D., Belfast; G. Gray, Belfast; John Kennedy, M.D., Belfast; Henry Lupton, M.D., Galway; John Wilson McCloy, M.D., Belfast; Edward Louis McSheehy, M.D., Cork; Pierce Mansfield, B.A., M.D., Cork; John W. Mulligan, M.D., Belfast; John O'Connor, Cork; Wm. Arthur O'Connor, Cork; James J. Louis Rattan, M.D., Cork; James Hutton Ritchie, Belfast; James Edward Saunderson, M.D., Galway; Edmund Townsend, B.A., Cork; George Vesey Wood, M.D., Galway, Cork, and Belfast.

First University Examination in Medicine.

Second Class—Thomas W. Charles, Belfast.

Third Class—William F. Newsam, Cork; Gordon Price, Belfast; William Price, Belfast; William H. Saunderson, M.A., Galway.

Unclassed—Isaac Henry Anderson, Belfast; Mark Edward Anthony, Cork; John Barry, Cork.

Unclassed—William Fuller Bennett, Cork; John Stewart Boyd, Belfast and Galway; Thomas Carmichael, Cork; James Chatterton, Cork; Robert Delacour Corbett, Cork; William Scott Core, Belfast; Timothy Crowley, Cork; John Snow Allen Cunningham, Galway; Francis A. Davy, Galway; Eugene Victor De Meric, Galway; William Dobbin, Belfast; John Donovan, Cork; Humphrey John Donovan, B.A., Cork; John Dundee, Belfast; Alexander William Duke, Galway; James Dundee, Belfast; James William Fisher, Cork; Edmund Maur Fitzgerald, Cork; John Francis Fitzpatrick, Cork; Robert Gage Fleming, Belfast; Michael Uppington Greany, Cork; Eugene Hamilton, Cork; George Percival Hadley, Belfast; Charles Sidney Heap, Cork; Alexander Heron, Belfast; Matthew Horgan, Cork; Robert Hunter, Belfast; John Jennings, Cork; Leslie Jones, Cork; Hugh Joseph Kean, Cork; Christopher William Keays, Cork;

Joseph Lindsay, B.A., Belfast; Terence J. A. Lynam, Galway; Frederick Lyons, Cork; Thomas Lumsden, Cork; Michael Mahon, Galway; Timothy Brown MacAuliffe, Cork; Charles McConaghey, Galway; William McConaghey, Galway; David McKee, Belfast; John Malone, Galway; Patrick Martin, Cork; John W. Martin, Galway; John N. Nason, Cork; Richard O'Brien, Cork; Jas. J. O'Brien, Cork; Daniel O'Connor, Cork; Thomas Pegum, Cork; Charles Gore Purcell, Cork; William Robinson, Cork; John Ralph Ross, Galway; Francis Roche, Cork; Richard Ryan, Cork; James Hutton Ritchie, Belfast; Thomas Henry Sandford, Cork; John Sisk, Cork; William Stephens, Galway; John C. Sugars, Galway; Geo. William Thompson, Belfast; James Trimble, Belfast; Alexander Trousdell, Cork; Michael Francis Ward, Galway; Alexander Young, Belfast.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following Members of the College, having been elected Fellows at previous meetings of the Council, were admitted as such at a meeting of the Council on the 11th inst. :—

Collins, John Hammett, Jumalpole, East Indies; diploma of membership dated July 26, 1839.

Cumming, Robert Butterfield, M.D. St. Andrews, Malpas, Cheshire; June 16, 1835.

Hallsorth, Samuel Marsden, Atherstone, Warwickshire; October 2, 1840.

APOTHECARIES' HALL OF LONDON.—The following gentleman passed his examination in the Science and Practice of Medicine, and received a certificate to practise, on Oct. 4th :—

Smith, Henry, Blackrod, Chorley, Lancashire.

The following gentlemen also on the same day passed their first examination :—

Anderson, William, St. Thomas's Hospital.

Fawsitt, Thomas, Manchester Hospital.

Prior, Richard Henry, King's College Hospital.

Waller, Arthur, St. Thomas's Hospital.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—On St. Luke's Day, the 18th instant, the annual stated meeting took place, agreeably to the provisions of the Charter of 1692. The following officers were elected for the ensuing year :—

President—William Stokes.

Vice-President—William Moore.

Censors.

William Moore.

Wensley Bond Jennings.

Thomas Waugh Belcher.

Samuel Gordon.

Treasurer—Henry Law Dwyer.

Registrar—Lombe Atthill.

Honorary Librarian—Thomas Waugh Belcher.

Librarian on Sir P. Dun's Foundation—Hugh James Fennell.

Representative on the General Medical Council—Aquila Smith.

Professor of Midwifery—Edward Burrows Sinclair.

Professor of Medical Jurisprudence—Robert Travers.

Examiners in Midwifery—John Ringland, George Johnston.

Examiners in Arts—John Ringland, Thomas Waugh Belcher, Arthur

Wynne Foot.

Agent to College Estates—Richard Uniacke Roberts.

At the same meeting the following gentlemen, Licentiates of the College, were duly elected Fellows :—

Henry Edward Eastlake (of London), M.A., Phil. Doc.

Henry Haswell Head (of Dublin), M.D., Edin.

The Honorary Fellowship was conferred on the following :—

A. Trousseau, Professor of Clinical Medicine, Paris.

Sir Thomas Watson, Bart., M.D., and sometime Fellow of St. John's College, Cambridge; President of the Royal College of Physicians of London.

Alexander Tweedie, M.D., Edin., Fellow of the Royal College of Physicians of London.

DEATH OF M. ROSTAN.—M. Rostan, Honorary Professor to the Faculty of Medicine of Paris, one of the celebrities of French scientific medicine, has just died of diabetes at the age of 77. He always exhibited a remarkable affection for the medical students, and this trait was exhibited remarkably by the fact that when he felt his end approaching he removed from his own house to the neighbourhood of the schools. "He could not bear," he often repeated, "that his dear pupils should be obliged to go so far in order to follow him to his last abode."

A COMMITTEE of the Lords of Her Majesty's Most Honourable Privy Council sat a few days ago at the Council Chamber, Whitehall, on the subject of the Cattle Plague. The lords present were the Right Hon. Spencer Walpole, and the Right Hon. H. Corry. Mr. Helps and Colonel Harness attended the committee.

THE Commissioners of the Metropolitan Police of Dublin report, that the number of houses in that city which are destitute of those appliances and means of cleanliness on which the health of the inmates depends is 1648.

At the last Old Bailey sessions, Dr. Juler prosecuted two youths for attempting to extort money by an odious accusation against him, and they were convicted and received a sentence of seven years' penal servitude. Last week a warrant was applied for and granted against the doctor for perjury. He got information of this, and absconded.

THE CONTAGIOUS DISEASES PREVENTION ACT, 1866.—The Lords Commissioners of the Admiralty and the Secretary of State for War have appointed Dr. Peter Leonard to be Inspector of Certified Hospitals under the above-mentioned Act. Notice is hereby given that William H. Sloggett, Esq., Staff Surgeon, R.N., appointed Visiting Surgeon under the provisions of the Contagious Diseases Act of 1866, notice of whose appointment appeared in the *Gazette* of the 2nd of this month, has been appointed Visiting Surgeon at Plymouth and Devonport, and not Devonport only, as formerly notified.

LABELLING BOTTLES.—A "Travelled Parson" writes : In some parts of Germany every bottle containing poison is labelled with a death's head and cross bones, as black as printer's ink can paint them. Every parcel of poisonous medicine sent to a patient has a similar label over the address. Pray help me to urge upon our chemists and druggists the adoption of this very simple method, which is plainly within the comprehension of the dullest boy that ever handled a pestle and mortar.

PRISON PUNISHMENTS.—Dr. M'Donnell, the Medical Superintendent of Mountjoy Government Convict Prison, in his report on the past year expresses his regret that public opinion has of late set so strongly against corporal punishment. The result is that prison punishments are awarded, which tend to develop scrofulous diseases, from which the criminal class suffer so greatly, and which occasion so large a proportion of the mortality in our convict prisons. Restricted exercise, insufficient clothing, and curtailed diet are all of them objectionable as punishments for prison offences. A high scale of diet, Dr. M'Donnell reports, is not necessary for convicts; the great majority of them do not so feel the degradation of their position as to be depressed by it and to require the counter action of additional food, and the few who do take it much to heart, so as to get out of health, do not ask for more food, and could not digest it if they got it. The scale of diet should, of course, be as economical as is compatible with the maintenance of health, but then a diet punishment is inadmissible, and it gives a kind of triumph to the offender if he is taken off punishment by order of the medical officer. Curtailed diet, tells quickly on those who are still growing, and also on the elderly. After some days a low degree of fever begins, with considerable thirst. Experienced offenders, however, do not drink, they merely dip the tongue in water. They do not allow themselves to drink water freely until the period of punishment is nearly up: then they take water copiously. Handcuffs make a severe punishment, and the general health does not suffer much. The dark cell, according to Dr. M'Donnell's report, is now rarely or ever used; but when it was he did not find that it produced the terrible effects attributed to it.

COCHINEAL.—The imports of cochineal from the 1st of January to the 1st of September last amounted to 4662 bags of Honduras, 870 bags of Mexican, and 6460 bags Tenerife, making a total of 11,992 bags; the deliveries to 3928 bags of Honduras, 809 bags of Mexican, and 7852 bags of Tenerife, making a total of 12,589 bags; and the stock in hand to 2687 bags of Honduras, 666 bags of Mexican, and 1709 bags of Tenerife, making a total of 5062 bags. The imports to the same period last year amounted to a total of 8535 bags, the deliveries to 10,664 bags, and the stock on hand to 4939 bags.

HYDROPHOBIA.—EXTRAORDINARY CASE.---At an inquest held on the 5th instant, at Bradwell, Bucks, on the body of a child who died from hydrophobia, a witness stated :—"I saw the deceased child after it was bitten by the dog, which was about nine weeks back, and was requested by the father of the child to give her some of the liver of the dog, and he was to get some from the dog, which had been killed and buried. I accordingly went to the house—it was either the day after the child was bitten or the next day. The mother cut off a piece of the liver, weighing about an

ounce or an ounce and a half. I frizzed it before the fire on a fork, for a few minutes, till it was well cooked and fried up, and then gave it to the child, with some bread. She ate it freely, about two mouthfuls, and had some tea after it." The grandfather and parents of the child were anxious for the liver to be given, thinking it would prevent the bite of the mad dog taking effect, as formerly an uncle of the child had escaped hydrophobia after having been bitten, and having taken some of the liver of the dog which bit him. In that case, it is stated, the carcass of the dog had been in the water nine days before the liver was taken out.

Appointments.

LONDON.

DR. MACKINTOSH has been appointed Surgeon for the Western District of the Chelsea, Brompton, and Belgrave Dispensary, Sloane-square, vice J. Starling, L.R.C.P.L., resigned.

MR. W. POWELL has been appointed House-Surgeon to the Charing-cross Hospital, vice Mr. Airey, resigned.

PROVINCIAL.

MANSER, F., M.R.C.S.E., has been appointed House-Surgeon to the Tunbridge Wells Infirmary.

MR. G. RAINE, of Guy's Hospital, has been appointed House-Surgeon and Dispenser to the West Ham, Stratford, and South Essex Dispensary, vice Adams, resigned, on receiving an appointment at the London Hospital.

T. REYNOLDS, M.R.C.S.E., has been appointed Medical Officer for the West Drayton District of the Uxbridge Union, vice R. King, M.R.C.S.E.

AMOS INGHAM, M.D., has been appointed Certifying Factory Surgeon for Haworth, Yorkshire, vice E. S. Hall, M.R.C.S.E., deceased.

J. F. JONES, L.F.P. & S. Glas., has been appointed Medical Officer for the Llanegrynny District of the Dolgelly Union.

R. L. JORDISON, M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Hornchurch District of the Romford Union, vice J. J. M'Aldin, M.D., resigned.

J. S. WALKER, M.D., has been appointed Medical Officer of Health for Hanley, Staffordshire, vice J. Scott, M.R.C.S.E., deceased.

R. WILMOTT, M.R.C.S.E., has been appointed Medical Officer for the Colne Union, Wilts, vice J. D. Bishop, M.R.C.S.E., resigned.

J. A. BRIGHT, M.R.C.S.E., L.S.A., has been appointed Surgeon to the County of Somerset Constabulary Force. Mr. Bright has also been appointed Public Vaccinator and Poor-law Medical Officer to the 3rd District of the Wells Union.

H. W. COLEMAN has been appointed Assistant Resident Medical Officer to the Leeds General Infirmary, vice Mr. L. Hirst, resigned.

H. V. GARMAN, M.R.C.S.E., has been appointed Medical Officer for the North District of the Poplar Union, vice W. T. G. Woodforde, M.D., resigned.

J. F. HENDERSON, M.D., has been appointed Medical Officer for the Kirkby Stephen District and the Workhouse of the East Ward Union, Westmoreland, vice W. D. Blades, M.R.C.S.E., resigned.

IRELAND.

R. SHAW, L.R.C.S.I., has been appointed House-Surgeon and Apothecary to the Westmoreland Lock Hospital, Dublin, vice B. F. M'Dowell, M.B., appointed Visiting Surgeon.

P. HENDRICK, L.R.C.S.I., has been elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Kilmakevogue Dispensary District of the Waterford Union, vice J. D. Kelly, L.R.C.P.Ed., resigned.

W. STEWART, M.D., has been appointed Medical Officer for the Portadown Dispensary District of the Lurgan Union.

SCOTLAND.

WOLSTON, W. T. P., M.B., has been appointed Resident Medical Officer of the Royal Hospital for Sick Children at Edinburgh.

J. A. LOTHIAN, M.D., has been appointed Medical Officer for District No. 7 of the City Parish of Glasgow, vice P. Morrison, M.D., resigned, and since deceased.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

LONDON—BIRTHS.

BARCLAY—Oct. 2, Bruton-street, Berkeley-square, the wife of Dr. Barclay, of a son.

BROWN—On Oct. 11, at Hampstead, the wife of Dr. Gossett Brown, of a daughter.

GOULLET—On Sept. 26, at The Firs, New Wimbledon, the wife of Dr. Goulet, of a son.

KEMPSTER—On Oct. 9, at Oak House, Battersea, the wife of W. H. Kempster, M.R.S.E., of a son.

MARRIAGE.

COLES—HANKS.—On October 13, at St. Luke's, Cheltenham, W. S. Coles, M.D., Surgeon-Major, Bombay Army, to Emma, only daughter of the late John Hanks, Esq., of Cold Aston, Gloucestershire.

DEATHS.

WALNE.—On the 3rd inst., at Guildford-street, Russell-square, after a short illness, D. Henry Walne, F.R.C.S.E., Consulting Surgeon to the German Hospital, and Vice-President of the Society for the Relief of Widows and Orphans of Medical Men.

BARLOW.—On October 13, at Longton Lodge, Sydenham, G. H. Barlow, M.D., aged 60.

Merrion Baths & Ladies' Bathing Place.

Hot, Vapour, Douche, Sitz, Wet Sheet or Dry Blanket Sweating Baths. These Baths are beautifully situate, close to the Railway station and the nearest pure sea water to Dublin, therefore an invaluable retreat for the convalescent. Baths of every Kind always ready.

T. H. BENSON, PROPRIETOR.

P.S.—Busses ply daily every hour to and from Dublin and Merrion.

Cow-Pock Institution, 45, Upper Sackville-Street, DUBLIN (1804).

Patron—His Excellency the Lord Lieutenant.

Secretary—Henry L. Dwyer, M.D.

Assistant-Secretaries—Edward B. Sinclair, M.D.; George Montgomery, M.D.

Children of the poor brought to the institution, 45, Upper Sackville-street, on Tuesdays and Fridays, between 11 and 2 o'clock, or to the Southern Branch, 45, York-street, on Mondays and Thursdays, to 35 $\frac{1}{2}$, New-row, West, or 22, Fœnix-street, on Wednesdays, to 22, Wentworth-place, or 53, Sheriff-street, on Saturdays, between 10 and 12 o'clock, are vaccinated gratis. Packets of infection, which may be transmitted by post, half-a-crown each. Practitioners and Dispensaries supplied for half a guinea per annum, and Union Workhouses, on the application of the respective clerks, supplied for one guinea per annum each. Surgeons of the Army supplied on application to the Army Medical Office, Dublin. Applications for Lymph, and communications prepaid, are to be addressed to the Secretary, 45, Upper Sackville-street, Dublin.

Apothecaries' Hall of Ireland, 40 Mary-

street. The following new Medicines and Preparations are manufactured in the Laboratory on the premises, and a supply constantly on hand:—

Concentrated Solution of Chloride of Lime, Carbolic Acid, Permanganate of Potash. And the other Disinfectants now in use. Tincture of Calabar Bean. Chlorate of Quinine. Artemisia Vulgaris (Dr. O'Rourke's Remedy for Epilepsy). Ether for Local Anæsthetic purposes, &c. &c.

TO THE MEDICAL PROFESSION.

Wenham Lake Ice and Calvesfoot Jelly ALL SEASONS, AT

J. S. MAGUIRE'S, 51, WESTLAND-ROW.

ESTABLISHED FOR

Wedding Cakes, Dejeuners, &c., &c.

Pastry, and General Confectionary, of the best quality.

BEWLEY, HAMILTON & Co.'s

COD-LIVER OIL OF 1866.

This Oil, as originally prepared by them

in 1850, and since then yearly, with the increasing approbation of the profession, and of those numerous Invalids who have derived such inestimable benefits from its use, is extracted from the fresh Livers of the Channel Cods, on B. and H.'s own Premises, and under their immediate superintendence, and is possessed of the properties of this valuable Medicine in an eminent degree.

Sold in Pints, Half-Pints, and Quarter Pints, in Bottles, secured by their Stamps, by

BEWLEY, HAMILTON AND CO.,

(Late Bewley and Evans),

STATE APOTHECARIES,

3 AND 4, LOWER SACKVILLE-STREET, DUBLIN.

Sir J. MURRAY'S Pure Fluid Magnesia

is recommended by Physicians since 1807 for Bile, Acidities, and Indigestion. They also order his CORDIAL CAMPHOR (3 grs. per ounce) as the best restorative for weak nerves or low fevers. His LEMON SYRUP, mixed with either Fluid, forms a brisk Aperient for any age—bottles 1s. and 2s. 6d. To guard against false liquids the Patentee's labels are subscribed "Sir J. MURRAY, Physician to the Lord Lieut."

Mr. Howard, Surgeon Dentist, 52, Fleet- STREET, LONDON,

has introduced an entirely NEW DESCRIPTION of ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble natural teeth as not to be distinguished from the original by the closest observer, they will never CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does NOT REQUIRE the EXTRACTION of ROOTS, or any PAINFUL OPERATION, and will support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication. Decayed teeth stopped, and rendered sound and useful in mastication.—52, Fleet-street, London.—At home from Ten till Five.

Notice to the Medical Profession.

DR. MITCHELL begs leave to inform the above that he continues to receive PUPILS in his Classes of MATERIA MEDICA and PHARMACY, at his Residence, No. 118, Stephen's-green West, for the Army and Navy Boards, and all Licensing Bodies in the United Kingdom.

P.S.—Terms will be found moderate.

For hours of attendance please apply at 118, Stephen's-green, West. 5th October, 1866. A. MITCHELL, M.D.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium.)

Light-Brown Cod-Liver Oil.

The late Sir HENRY MARSH, Bart., M.D., Physician in Ordinary to the Queen in Ireland:—"I consider Dr. de Jongh's Light-Brown Cod-liver Oil to be a very pure Oil, not likely to create disgust, and a therapeutic agent of great value."

Dr. BARLOW, Physician to Guy's Hospital:—"I have been well satisfied with the effects of Dr. de Jongh's Cod-liver Oil, and believe it to be a very pure Oil, well fitted for those cases in which the use of that substance is indicated."

Dr. LANKESTER, F.R.S., late Lecturer on the Practice of Medicine, St. George's School of Medicine:—"I consider that the purity and genuineness of this Oil, are secured in its preparation by the personal attention of so good a chemist and intelligent a physician as Dr. de Jongh, who has also written the best Medical Treatise on the Oil with which I am acquainted. Hence I deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regards genuineness and medicinal efficacy."

GALVANISM.

WALLS, CLOSE, AND CO., NEWLY IMPROVED

PATENT MAGNETIC ELECTRIC MACHINE,
A SURE CURE FOR RHEUMATISM AND MANY OTHER COMPLAINTS.

No. 1.—Price 40s.

The principal Doctors in the World acknowledge it to be a valuable Remedy for Nervous Diseases. This being a positive fact, each person troubled with such affections, should obtain one of these Machines at once, and prove the truth of the above statement.

Directions—No. 1.—To each Conductor or Handle, are small wires, insert them in the holes (H H) on the top of the box, and bind them with the thumb screw; then draw out the Knob (R) which regulates the Machine as the Patient may require. To keep the Machine in good order, care should be taken to place the knob in its former position. When applying the raw Silver Conductors to diseased parts of the body, cover one of the Conductors with a flannel soaked in water. All the spindles and the spring should be carefully oiled.

"We have tried the Magneto-electric Apparatus of Messrs. Walls, Close, and Co., of Bow-lane, and find it a remarkable compact, cheap and efficient instrument. It is supplied with handles for administering the currents conveniently to any part of the body. Practitioners who are not within reach of Dr. Althaus or Mr. Harry Lobb, should possess one of these Machines for restoring limbs that have been paralyzed by disease of the nervous apparatus or by the inaction consequent on compound fracture," &c.—*Medical Times*.

GALVANIC APPARATUS,
TO WORK WITH ACIDS.

Complete

No. 2.—Price 30s.

in Box.

On without

Stand box.

Who will supply Surgeons, &c., at above prices, or can be had direct from the MANUFACTURERS,

WALLS, CLOSE, AND CO.,
42½, CANNON-STREET, LONDON.

CRYSTAL COD-LIVER OLEINE.

This Oil is a Pure Oleine. It is nearly Transparent, Inodorous, and almost Tasteless. It can be taken without any Menstrum, and produces less Nausea and Eructation than any other quality of oil. From the fact that the solid parts of the Crude Oil are entirely removed in the process of refining, and that the OLEINE alone is left, the substance approaches more nearly to a food than a medicine, admitting of the easiest digestion and assimilation.

CASE OF
ALBUMENOID URÆMIC CONVULSIONS ON
EIGHTH DAY AFTER DELIVERY:
RECOVERY.By THOMAS TELFORD, M.D., L.R.C.S.I. & E.
ASSISTANT-PHYSICIAN, ROTUNDA HOSPITAL.

MARGARET GIBNEY, aged 38, was admitted to the Dublin Lying-in Hospital on September 6th in labour of her third child. I was called to see her immediately, in consequence of the very debilitated condition she was in. Her general appearance conveyed the idea of great anæmia and extreme exhaustion; her face, hands, and lower extremities were enormously œdematous, pitting on pressure, and her breathing laboured. She was also suffering from severe diarrhœa of an extremely offensive nature, so much so, that we were obliged to use disinfectants very freely before we could make any further examination of her case. The surface of the body was cold; the pulse very slow and weak, only 54 in the minute; the heart's action irregular, and her strength very much diminished. Notwithstanding all this the uterine action was strong and regular. She was ordered four ounces of wine immediately, a mustard plaster applied over the heart, and warmth to the extremities. On making an examination, the labia were found to be œdematous and distended to the size of a fœtal head; she was in the second stage of labour, the head presenting. On consultation, immediate delivery was decided on, as we were in dread either that she would have an attack of convulsions or die undelivered. The fœtal heart was next carefully sought for, but could not be heard. However, as the head was low down, and there being plenty of room, we determined to deliver her with the forceps. The urine was drawn off, and delivery accomplished with the greatest ease. The child, a female, was alive and quite healthy; thus showing that the fact of not hearing the fœtal heart is not positive proof of the child's death, unless it has been audible at some previous part of the labour. The placenta was expelled in five minutes, and as there was no hæmorrhage the binder was applied. External warmth was kept up, and she was ordered some more wine, a full anodyne, and beef-tea diet. On questioning her as to her previous history, she told me that she had not had a child for the last thirteen years, though she had an abortion some eighteen months since; that she had enjoyed good health till the last eight months, when she perceived the swelling of her extremities. Though not an habitual drunkard she has committed excesses whenever an opportunity presented, and has been exposed to a great deal of poverty and hardship, earning her living chiefly as a charwoman. She had no medical treatment before admission.

September 7th. Has rallied considerably since yesterday; the œdema of face considerably increased; heart's action quieter, respiration more tranquil, and the pulse 64, and of good volume. To continue her wine and beef-tea diet. On the addition of heat and nitric acid to a portion of her urine, it became converted almost into a solid mass.

9th. The breasts are full and distended with milk; œdema still continues undiminished. Ordered half-drachm doses of the compound powder of jalap every

second day, to have imperial as a drink, and this mixture:

℞ Tinct. mur. ferri, ʒiij.
Infusi quassia, ʒij. M.

ʒi. three times a day. To continue wine and beef-tea.

On the sixth day she had chop diet, and seemed to be going on steadily to convalescence, the œdema having considerably diminished.

14th (eighth day). At six A.M. she had an attack of convulsions, of which we had all along been apprehensive; the fits were very severe and prolonged, consciousness not being established between them. She was immediately ordered a turpentine and fœtid enema, and mustard stupes to the legs. At nine A.M., the fits continuing, the enema and stuping were repeated, the top of the head blistered with vesicating collodion, a bladder of ice applied to the forehead, and she was ordered four ounces of wine and an ounce of the following mixture every four hours:—

℞ Ar. spt. ammonia, ʒij.
Etheris chlorici, ʒiij.
Spt. etheris nitrosi, ʒiij.
Aquæ ad. ʒvii. M.

The pulse at this time was 100. During the day the fits returned at varying intervals, the longest being five hours. At the evening visit she was lying in a semi-unconscious state, from which she was roused with great difficulty; the pulse 120. As the blister had only partially risen on the head, the collodion was reapplied, and the other treatment continued.

Her case now seemed a hopeless one, and our prognosis was anything but favourable. At half-past ten she had a very severe fit, during which she lacerated her tongue very much. The fits now became very quick in succession, and her pulse rose to 130. The stuping to the legs was repeated, and the blistering fluid applied to the upper portion of the spine. She was ordered to have more wine during the night.

16th. Passed a very restless night, continually tossing about the bed, but had no return of the convulsions; pulse 116; wine and beef-tea diet. In the evening she was extremely restless we were induced to give her a draught containing half a drachm of solution of muriate of morphia, with half a drachm of chloric ether in an ounce of water. This produced the desired effect, and she passed a pretty quiet night.

17th. Appears much better; the pulse has fallen to 92, and her mind is clearer. On the following day (18th) the powders of comp. jalap were repeated, imperial given as a drink, and her iron mixture renewed; the œdema of the extremities considerably diminished; her legs were well rubbed and then bandaged with flannel; the urine still contained a considerable quantity of albumen. From this time her convalescence was steady and rapid. She left hospital on the 27th day of September, just three weeks after delivery. We would have wished her to remain longer, as the urine was still albuminous, but her private arrangements prevented her.

I would not have gone so minutely into this case but that I consider it one of extreme interest, when we remember the debilitated condition in which this patient was admitted (any one who saw her, thinking she would not live more than a few hours); the steady convalescence which she made for some time; the late period at which the convulsions came on, their frequency—there being eleven fits—and the favourable result; we must allow this to be a remarkable case. The plan of treatment adopted after the accession of convulsions was altogether stimulating and nutritive, the idea of any depletion being altogether discarded, owing to the patient's previous state.

The causes of convulsions have been classified according to the condition of the blood, into the hyperæmic, anæmic, and toxæmic. We, however, often find those conditions more or less combined, and, if we bear this in mind, I think our treatment will be attended with more success. Toxæmia may be associated with either a hyperæmic or anæmic condition; in the first case depending more on the

effects of pressure producing a congested condition of the kidney leading to albuminuria and consequent uræmia; in the second more frequently depending on organic disease of the kidney. Hence, the difference in the treatment of uræmic convulsions; for while in the one case depletion is beneficial, in the other it is positively injurious.

ON CRANIOTOMY.

By G. de GORRQUER GRIFFITH,

PHYSICIAN TO THE HOSPITAL FOR WOMEN AND CHILDREN, PIMLICO; PHYSICIAN-ACCOCHEUR TO THE SAVIOUR'S MATERNITY; SOME TIME HOUSE-SURGEON AT THE HOME FOR DISEASES OF WOMEN.

IN your number for September 12th, 1866, I published two cases of craniotomy; in the paper I took exception to some observations made by Dr. O'Flynn in his article on the same subject.

Dr. O'Flynn has replied to my exceptions, and to his reply I now make answer.

I would first say that I trust I have not given annoyance or offence by my strictures or queries, since my object was not to annoy or offend, but to obtain more complete ventilation for the subject, and to elicit from Dr. O'Flynn further particulars about his method of performing craniotomy. My remarks were altogether based upon an ardent desire to learn, and were not made in a carping spirit, or with the view to cause to be undervalued Dr. O'Flynn's abilities and talents. Life is too short to spend it in mere verbiage and quarrels, instead of devoting every effort to the more complete learning of that profession in which each has been placed, and in it doing—as far as in him lies—his entire duty.

I am sorry that Dr. O'Flynn does "not attach so much importance to the use of chloroform in midwifery practice as Dr. Griffith seems to do"—and does; because thereby he is an immense loser.

Within eighteen months I have attended, in the course of my private practice, about 220 midwifery cases; in many used chloroform; and in not one single instance have I cause to regret having so done, but on the contrary have every cause—under Divine blessing—to congratulate myself on the attendant success.

Dr. O'Flynn states: "The cases published by Dr. Griffith are not calculated to alter his opinion on the subject of chloroform." I think Dr. O'Flynn can urge no objection whatever to the advantage gained by having administered the drug in the second case which I have reported; nor could he possibly deny that a still *greater* advantage had been obtained in the case of the first-mentioned patient, had he stood by her bedside.

She had been in labour for some days. She had been the subject of convulsions for at least two days preceding my visit; she had been insensible for some time before I saw her; the pains had all but ceased; a very, very little uterine contraction taking place at long intervals, and having as their only effect the inducing of a convulsion; the head of the fœtus locked in the ring of the pelvis, and the patient reduced so low that I feared she might die undelivered. Though insensible, yet when pinched she showed that she experienced pain.

The medical men who were in attendance had, I believe, done everything for her but bled her, given her chloroform, and delivered her.

When I was first summoned the patient was so low that to draw blood would have been—humanly speaking—to have at once extinguished the life feebly struggling to exist—so low that, as I have mentioned in my paper, I had to order the patient to be freely supplied with stimulants—so low that, "having roused the flagging energies," then, and then only, I caused the chloroform to be administered, then, and only then, "I performed craniotomy"—so low, that I had to wait till "the flagging energies" were aroused.

Surely Dr. O'Flynn knows that when a strong woman has been in strong labour for some time, even without the concomitant of convulsions, and that these labour pains have proved ineffective to expel the child, and have ceased, or all but ceased, the patient is nearly worn out, nature nearly exhausted.

I repeat that when I had the chloroform administered the patient was insensible; but though she lay in this state she was thrown into convulsions by the feeblest uterine contractions, by mere vaginal examinations, and felt pain when she was pinched. Undoubtedly, Dr. O'Flynn, would not in this case have bled? Have bled? When the warm fluid was already becoming cold with the ice-chill of death!

Would he not rather say with me that chloroform should have been given earlier, and the patient delivered sooner? Assuredly he would! I have known patients in convulsions to be bled, aye till almost no blood has been left, and the last death struggle to be a convulsive seizure; and Dr. O'Flynn, too, knows that convulsive patients have been bled, bled, purged, purged, blistered and lowered, and yet withal die—I will not say of the treatment, but that they have died uncured by *such* treatment, have died *while under* such treatment, the convulsions having persisted up to the last hour of life.

In the case of my patient the convulsions were *immediately* stopped as soon as she was fully anæsthetized, nor did they return after delivery; but she had to be fully anæsthetized before the operation could be commenced, because the moment the fingers entered the vagina a convulsion supervened, the legs and thighs were forcibly straightened, and kept closely and tightly together so as to hinder the introduction of the instruments, much more the working with them. This difficulty could be overcome only by the agency of the chloroform, or by brute force—physical strength; and few men would like to pass the perforator into the vagina of a patient whose movements, while she was in the unconscious state I have described, depended for their control upon the steady, even, physical, force used by nurses, or even by medical men fully alive to the dangers of the operation, particularly when the patient could be anæsthetized, for the time rendered wholly insensible to all pain or anguish, and so deprived of voluntary muscular power as to offer no resistance to any manipulation. The object in giving chloroform in such cases should be not only to take away the voluntary muscular power or resistance from the voluntary muscles, but likewise the involuntary or reflex action of these same muscles.

Would it not be very difficult for Dr. O'Flynn, to operate when the patient's thighs and legs were rigidly straightened in the convulsive spasm, the thighs tightly drawn together, and the patient, in addition, every now and then moving herself uneasily in the bed?

I know that Dr. O'Flynn will meet my query by saying, "You should pause when the convulsion supervened." I would remind him that, had I done so, I should never have (without the aid of chloroform) been able to have operated, since the moment any attempt was made even to examine (much more to operate), until the patient was wholly anæsthetized, the convulsions immediately commenced. Had I paused each time a convulsion set in, my patient would have died *undelivered*.

Though I have already, I think, answered Dr. O'Flynn's query—"Why administer the drug to a person in a state of insensibility?"—I would ask him has he never seen a person insensible or unconscious from any cause, yet capable of being roused by even much less painful manipulation than is necessary in craniotomy, to such a degree as to render it extremely difficult and hazardous to perform such an operation as the one under discussion?

The records of my hospital can prove that insensibility (in the ordinary acceptance of the word) and anæsthesia from chloroform are widely different, and indeed every accoucheur of experience knows that the unconsciousness

of convulsions and the anæsthesia of chloroform are wholly different states. Moreover, I contend that Dr. O'Flynn does not answer his own question when he says, "As well might Dr. Griffith give opium to a woman in sound sleep." Surely there is a vast difference between sound sleep and the narcotism resulting from the use of opium.

Dr. O'Flynn mistakes me when he states, "Dr. Griffith tells us that *all* the fatal signs pointed to cephalic mischief," since I have told nothing of the kind. *My words are:*—"All the fatal signs pointed to cephalic mischief, and to disturbance of the entire nervous system." How different from what I am represented to have written!

Dr. O'Flynn is an old enough practitioner to know that it needs not "profuse hæmorrhage" to lower the system to the condition in which I found the patient, and that nervous exhaustion, coupled with shock, or even not so conjoined, will occasion such a state of extreme prostration as will contra-indicate bloodletting either "from the arm" or by "a few leeches to the temples."

Moreover, my remark is made to demonstrate the fact that the fatal result occurred "from cephalic mischief and from the disturbance of the entire nervous system," and not from any want of skill in the performance of the operation. I would also remind Dr. O'Flynn that our patients in London do not bear well depletory measures even in such instances as this before us, and that this patient had been freely purged and blistered without any good effect, but that chloroform alone stayed the convulsions, and arrested the involuntary action or spasm of the voluntary muscles, occasioned by reflecting irritation.

Out of the number of cases I have attended (about 220 confinements within about eighteen months) I have used chloroform pretty freely, but in not one instance with any bad effect; on the contrary, with the happiest possible results. Nor do I agree with Dr. O'Flynn that we should withhold the drug where there is distension of the cerebral vessels, nor indeed where there is a tendency to congestion, since by checking the convulsion we prevent or arrest the congestion; and if the congestion should have decidedly commenced, we relieve it by staying that spasm of the muscles which originates the congestion. Any lowering effect which the chloroform inhalation may have on the heart and arterial circulation generally may be obviated by adopting the plan which I have advised in my first paper—namely, to give stimulants *before* resorting to the anæsthetic.

I do not know why Dr. O'Flynn states, that the convulsions of my patient *resulted* "from congestion of the brain," and that "the apoplectic state had *produced* the convulsive spasms," which were so rapidly relieved by the inhalation, when the convulsions, as I have reported distinctly, depended on the uterine irritation, and as distinctly *preceded* any head symptoms, or the symptoms of general nervous prostration. It is certainly, to say the least of it, a strange and rather cool way to arrive or jump at a conclusion. "We may conclude, &c. &c.," says the doctor, and he certainly does conclude, but altogether wrongly. I have yet to learn that apoplexy and congestion of the brain was the cause of the convulsions in the case which I have brought forward, and Dr. O'Flynn's rather strange assertion *in the face of* what I published has failed to convince me. I repeat that it was the uterine excitement, not "congestion of the brain," nor any "apoplectic state," produced the convulsions, the congestion of the brain and the apoplectic state, if such at all existed, which I very much doubt, being the resultants of the long-continued convulsions. I contend, from the experience of others, and from my own amongst my own cases, as well as amongst those of others, that had the convulsions been arrested in the commencement by that agent which Dr. O'Flynn does not sufficiently value, and had the patient been delivered earlier, I should "not have to record the premature death of a young wife in her first confinement."

I would draw Dr. O'Flynn's attention to the distinction

which I made (intentionally) in my original paper between "want of consciousness" and "the insensibility to pain." The passage to which I refer occurs in the following paragraph:—"From Dr. O'Flynn's words I gather that he does not employ chloroform in such an operation. If he did the patient could not be dispirited, or, indeed, know aught of suffering; and if he would adopt the plan mentioned in the body of my paper—namely, to give stimulants before employing the anæsthetic, he will find an immense advantage gained, inasmuch as he will be able to keep his patient for hours under the influence of the drug without there being any further need for administering stimulants, *since the want of consciousness, the insensibility to pain, and the rest obtained by the chloroform, do away with the necessity for them.*" In this I have distinctly stated what I know from actual experience, that the two states, "want of consciousness," in the usual acceptance of the word, and "insensibility to pain" are widely distinct.

In answer to Dr. O'Flynn's strictures on my second case, I must first take strong objection to the manner in which he writes, and by which he impugns the truthfulness of my narrative. I am unable to state not the "*how* the pelvis became so contracted, and the sacrum so prominent during the widowhood," for it is self-evident "*how*" the contraction arose—viz., from the incurvation of the sacro-lumbar or vertebral angle, this incurvation of the sacral promontory (I did not write of the entire sacrum, as Dr. O'Flynn has it), being the immediate cause. But I am unable to state the why "the pelvis, &c.," if it be not that the deformity is due to those changes which take place at the period of life to which the patient has attained. Unless we accept this as the cause of the incurvation I am unable to assign any other. For the word "*how*," I imagine Dr. O'Flynn intended to write "*why*."

Again, I must object to Dr. O'Flynn's writing that I stated "*all* the difficulty in this case arose from the projection of the sacral promontory!" inasmuch as I distinctly have it, that an obstacle other than the projection of the promontory presented itself to my attempt at turning (and that, too, though the patient was completely anæsthetized) that other being the tight cincturing of the fœtus by the uterus. Of course this latter did not call for craniotomy, but then it *was* another difficulty in the case. If Dr. O'Flynn would "look up" the literature of the subject, I think he would not find it so difficult to understand how a woman, whose pelvis was so deformed, as that described by Dr. Griffith, could "pass through twelve confinements without requiring medical assistance in some of them." I would simply remind Dr. O'Flynn of the present age of the patient, the time of life at which her other children were born; that she had given birth to them in quick succession, and at a time of life when the bones were more yielding and the joints more capable of allowing separation; and that it is not at all unlikely that, during her widowhood, the bones—after the rapid and frequent strains upon their capabilities of being separated—had settled themselves down into a narrower calibre, partly as a consequence of the rapid and frequent strains upon them, and partly on account of their tendency to increased ossification, and in their narrowed compass had become rigidly ossified. I would note that this is by no means the first case I have attended in which a woman has, with no difficulty whatever, nay, more, with ease, given birth to children, has remained for some years without child-bearing, has again commenced, and has then experienced no little difficulty, and needed medical assistance.

Dr. O'Flynn is again wrong when he writes, "*Whatever* caused the difficulty in this case," since it is obvious from my language that "the cause of the difficulty" I experienced was the narrowing of the pelvis in its antero-posterior diameter, owing to incurvation of the sacro-vertebral angle; and I imagine that Dr. O'Flynn means "whatever caused"—not "the difficulty"—but this incurvation of the lumbo-sacral angle.

I also agree with Dr. O'Flynn in "freely admitting

that Dr. Griffith was justified in doing the operation;" but I do *not* agree with him that it was a case in which the mode of delivery suggested by Dr. O'Flynn would have proved successful; since the density and unyielding nature of the cranial bones would have proved one obstacle, and the prominence of the sacral promontory another; and, besides, the forceps, the perforator, and the hand to guide the latter, would have engaged too much space. I am a little surprised, and yet I am not at all surprised when I review the entire tenor of Dr. O'Flynn's article, that Dr. O'Flynn should dogmatically assert "I have no doubt, &c., &c." My reason for breaking up the parietal bone first was that I might work with greater safety to my patient, and greater ease to myself; and I contend that had I pursued Dr. O'Flynn's method, it would *not* at all have answered, since the cranial bones would not have collapsed sufficiently to allow the head to pass through. I found it unsafe and very difficult to work upon the os frontis with the perforator; moreover, I wished by breaking up the parietal, when I had partly broken up the frontal, to rectify the position of the head with the view of drawing it through the narrowed brim in a smaller and more favourable diameter than the one presenting; and when I found that even in this rectified position I could not abstract the head, and that, too, having to my help the leverage and power which the craniotomy forceps gives, I patiently broke up the entire skull. There was no small difficulty in withdrawing the thorax, but as it moulded itself to the deformity, gentle, steady, patient, traction overcame the impediment.

I widely differ—very widely, indeed—from Dr. O'Flynn in the opinion that "protracted puerperal pain is not necessarily connected with diseased action, and leaves no bad effects after it has passed away."

I maintain that puerperal pain, prolonged too much, becomes in itself "diseased action," leads to and excites other diseased actions, creates immediate bad effects, and does "leave behind it bad effects"—not, it may be, in all cases, but certainly in the majority. Dr. O'Flynn will excuse my quoting the word "protracted" from the sentence preceding that which forms the remainder of my quotation, inasmuch as he and I are speaking of the use of chloroform—not in simple, but in very difficult and protracted labours; difficult as regards the patient and accoucheur; protracted as regards time, and the strength and energies of the sufferer. I have, therefore, carried on the word "protracted," since it belongs to the sentence I have quoted.

I operated on a patient *once* without chloroform, and she bore it so badly that I resolved never again—there being no valid objection to the employment of the drug—to undertake an obstetric operation without the aid of this most valuable agent. I cannot join in the words of Dr. O'Flynn, that "my experience teaches me that most women bear operations with wonderful fortitude and resignation," inasmuch as I have no similar experience, since I invariably use chloroform in order to prevent my patient knowing aught of her suffering through mental and physical pain, and to keep her from being "dispirited and exhausted," or even have the opportunity of becoming so, and that she may not require—to relieve this dispiriting and exhaustion—"to be plied with stimulants."

"I would rather see her dispirited" (and exhausted) from the operation, &c., "than comatose" from the chloroform, is the idea conveyed by the language of Dr. O'Flynn. He seems to consider me guilty of the "premature death of a young wife in her first confinement," and that it was the chloroform which I had caused to be administered to her that made her "comatose." I am a little surprised at this misunderstanding of my case, and yet I am not at all surprised when I review the entire tenor of Dr. O'Flynn's paper. He evidently forgot that the patient was insensible for some time before I was called in, that I did not write that she fell into coma during or even immediately after the administration of the chloroform: on the contrary, I stated what were the *facts* of the case,

"she bore it admirably," the "effects passed away," and she returned to the condition in which she was before the agent had been employed—viz., to an unconscious and insensible state—but not into a comatose; that she awoke, true, for a brief period, to consciousness, to reason, and to the power of recognition; that she again lapsed into insensibility, *after which*—not after the employment of the chloroform—coma supervened, such coma as in a number of instances precedes death), and she died comatose. I maintain that, humanly speaking, had the anæsthetic been earlier used—and *not* discarded, I will not say as Dr. O'Flynn would have advised, supposing he had seen the patient and reviewed her case in his mind—the result might have been other than I have recorded.

But of all the patients whom I have attended, and I have performed almost all the operations required in the obstetric art (except the Cæsarean section and division of the symphysis pubis), and some of them many times, I have not, thank God, lost one case, nor had one make a bad recovery, because I have ever acted promptly though not quickly, patiently though not tardily, not allowing the patient to become dispirited, nor to be run down with fatigue and nervous exhaustion. I agree with Dr. O'Flynn and the authorities he cites that the crotchet or hook is a very inefficient instrument; but then we have the craniotomy forceps—the instrument with which I finished the extraction of the head in one instance, in the other using the short forceps. This latter plan I prefer to Dr. O'Flynn's method, but having had no experience in his mode of operation, I can only theorise that it would be no easy matter to apply the forceps if the head engaged the entire ring of the pelvis, or to operate when the forceps, the hand, and the perforator were all at the same time in the vagina, more especially if the head lay high up, and required the long forceps.

Of this I am quite satisfied, that Dr. O'Flynn's method was not at all applicable in the case of my patient, nor in any similar instance where the head was so high up, the cranial bones so densely ossified, and not admitting of the overlapping or riding which ordinarily obtains, and where the mother was so deformed.

In Dr. O'Flynn's case of J. L., I apprehend that the diminution in the capacity of the pelvis was by no means great, and was perhaps trifling.

I am at issue with Dr. O'Flynn when he advises that, if after perforating once and after having withdrawn the perforator, the bones should so overlap each other that the opening is again closed, we should endeavour, despite the difficulties in the way, to introduce the crotchet. I much prefer reintroducing the perforator, and re-perforating, but when the bones have once been properly, *i.e.*, sufficiently broken up by the perforator, this difficulty cannot obtain. When using the perforator to enlarge the opening it has made in the cranium, we must bear in mind the extent of the narrowing of the pelvic diameter, the size of the head (as we may be able to form an opinion by careful examination), the relative sizes of the pelvis and the head, and make the enlargement proportionate to the respective sizes, that is, correlatively.

By remembering this rule we obviate the necessity for reintroduction of the perforator, or for any fumbling with the crotchet about the "closed opening." You will pardon the paradoxical expression, "closed opening."

Dr. O'Flynn says, "the forceps is less liable to lose its hold, and less likely to lacerate the soft parts." Of course from the connection of these two sentences the writer means, when the forceps *slip*, which they may do, as he shows in his paper, "they are less likely to lacerate the soft parts of the mother."

With ordinary care in using the crotchet and blunt hook, by guiding these instruments with the left hand while we are also guiding them by the right as well as making traction upon them with the same hand, we can, even should they slip, prevent the soft parts being injured, the points of the instruments coming into contact with the left or protecting hand of the operator, and not with the mother's

structures. When using the forceps and applying that force necessary for extraction through a deformed pelvis, if the instrument slip, which it may do, "when the head is opened, yields readily to pressure and becomes elongated," should there have been "let out much cerebral matter," there being then "no resisting medium," the vagina, rectum, or bladder, as the instrument comes away with a click, may be seriously bruised, cut, or otherwise injured, or the perinæum severely cut through or lacerated, as I have known to occur.

It is true that these mishaps may be prevented if the operator be seated, and have the elbow of the traction hand fixed firmly against the corresponding sides of his body.

How are we to know when we have let out sufficient cerebral matter; and, as the head elongates is not the "closed opening" (supposing we have perforated at the most depending part of the presenting head); the most depending part of the elongation, the very apex of the angle of the elongation, and as we draw upon the forceps, compress and elongate the head, will not more cerebral matter escape, so that the greater the elongation the greater the escape of brain substance, till the head becoming narrower than the curve of the blades, they "slip off having no resisting medium," the bones having "collapsed?"

I think it would be a most terrible thing for the child to be born alive, and that "it is" not "trifling," more especially when I know that it need never be "compared with the suffering that women are compelled to endure under the ordinary modes of delivery," inasmuch as women are not "compelled" to endure, unless the medical attendant refuse to administer the anæsthetic; inasmuch as women should not be called upon "to endure suffering," when that "suffering" may all be prevented.

Since writing most of the above, I have read a paper (in the MEDICAL PRESS AND CIRCULAR for October 3, 1866), entitled "Telford on Puerperal Fever," in which the author cites the case of a woman (Breen) who "had a convulsive fit, and died three or four minutes after the attack"—I presume in a state of coma. Death was "ascribed to primary apoplexy, with extensive effusion of blood, or to embolism." There was "made a very careful examination of the body; the membranes (of brain) presented no unusual congestion; there was no effusion of any kind; the substance of the brain was healthy throughout." "A woman named Butler was confined of her first child on the 23rd; labour natural; on the 24th she had a convulsion. She was ordered a turpentine enema, mustard stupes to the legs, and cold to the head. As consciousness did not return, and the pulse being full and strong, she was bled from the arm to twelve ounces, the head shaved, and painted with vesicating collodion; powders of calomel, and James's powder, were placed on the back of the tongue, and mercurial inunction employed. The mercurials, though steadily persevered in, produced no effect on the system. She continued in a comatose condition, with contracted pupils and stertorous breathing; died on the 26th, two days after her first attack, never having regained consciousness."

Here everything that skill and experience could suggest was employed, yet the woman died. Surely, Dr. O'Flynn would not say in this case—"I must here observe that if Drs. Denham and Telford had taken (more) blood from the arm, or applied a few leeches to the temples, they may not have to record the premature death of a young wife in her first confinement?" No chloroform had been used in this instance. "All the fatal signs pointed to cephalic mischief, and to disturbance of the entire nervous system," as in my case. No chloroform had been used. The patient died. Surely, Dr. O'Flynn would not accuse Drs. Denham and Telford of the death of their patient!

"On examination the brain and membranes were found quite healthy," but then there was, I apprehend, "disturbance of the entire nervous system" manifested towards

the close by prostration, and those other symptoms which make the case resemble that I have put on record, and to which I was called towards the termination. The symptoms in Telford's case were dependent on "the uterus being in a perfect state of gangrene." This produced "all the fatal signs which pointed to cephalic mischief, and to disturbance of the entire nervous system," owing "to some specific poisoning of the blood."

These cases I have quoted because they bear materially on the case of the patient whose death Dr. O'Flynn seems to lay at my door.

P.S.—I should have forwarded this before, but was hindered by not being able to snatch sufficient time from my other professional labours.

A SELECTION OF CASES FROM
THE UNPUBLISHED MSS. OF F. McEVOY, M.D.,
BALBRIGGAN, COUNTY DUBLIN.

By EDWARD WM. ADRIEN, M.B.C.S., L.K.Q.C.P.I.

(Continued from page 300.)

CASE OF TETANUS ELEVEN DAYS AFTER LABOUR—DEATH
RESULTING ON THE FOURTEENTH DAY AND THIRD DAY
AFTER THE APPEARANCE OF THE TETANUS.

Case 3.—Mrs. D., a fine healthy young woman, aged 27 years, was confined of her first child on the 12th of January, 1864. She informed me that she felt so well two days before I was sent for that she got up on the eighth day after her confinement, contrary to the wish of her nurse, who is attached to the dispensary, and a woman in whom I have the greatest confidence. She stayed up the greater part of that day, and after going to bed and sleeping for some time she awoke with a start, and found that she had caught cold, having, as she described, a creak in her neck and pains in her bones. She got up again next day and was much better until three or four o'clock in the evening, when she felt as if her head became too heavy for her to hold up, and was obliged to go to bed again.

On the 23rd I was sent for, and on my arrival she complained of having had very little sleep the night before in consequence of frightful dreams, but expressed herself much better since the perspiration came on, and seemed rather annoyed at my being sent for. I found her bathed in a profuse perspiration, complaining of stiffness in the back of her neck, slight sore throat, and pains in the bones; pulse 90; made water freely; bowels well opened, having taken a dose of castor oil the night before, and got a purgative enema. No tenderness over the abdomen or region of the womb, which could scarcely be felt; examination per vaginam could detect nothing, as the parts had nearly resumed their natural character, neither was there any laceration of the perineum or soft parts, for which I examined most minutely. The nurse informed me that she was only eight hours in labour, that the presentation was natural, and that the child and the secundines came away nearly together, that the discharge since was good but not abundant up to the eighth day, when it assumed a watery appearance, and totally ceased on the ninth day. When her husband came to register the child, he told me she complained of sore nipples, for which I sent her an astringent lotion. When I saw her I ordered her a diaphoretic mixture, anodyne draught, and camphor liniment. I left and called again in the evening.

On my arrival in four hours afterwards, she could not open her mouth, and had to get the nurse to support her head. I then ordered a blister to be placed along her spine, and one grain of calomel and opium to be taken every second hour.

24th. No better; pulse 110; bowels well opened during the night; perspiring profusely; breathing rather oppressed; complained much of stiffness in the muscles of

the back of the neck. She has just had the first spasm whilst I was examining her (per vaginam); I could detect no laceration whatever. I ordered her:—

Tinct. opii, 60 m.

Tinct. belladonna, 20 m. Misce.

In three draughts, one to be taken every six hours.

25th. Much the same as on my last visit; pulse 90; spasm not so severe or frequent as during the night; perspiration still continues; she refused to take any more liquids (and from this time forward all medicine was obliged to be given by enemata), as she considered they caused the spasm to return; breathing hurried; tetanic appearance of countenance very well marked; bowels opened, and made water freely.

I requested her friends to call in my neighbour, Dr. O'Reilly, who, although he brought nearly fifty years' practical experience to my aid, could not devise anything but what had been done. Hourly the tetanic spasms became more intense, frequent, and general, until, in spite of calomel, opium, chloroform, blisters to the spine, tobacco enemata, and in short everything we could think of, she died on the night of the 26th, just fourteen days after her confinement, and three days after the first appearance of the tetanic spasm.

Balbriggan, October 18th, 1866.

ULSTER MEDICAL SOCIETY.

CASES OF ASIATIC CHOLERA.

By Professor J. SEATON REID, M.D.,

PHYSICIAN TO THE BELFAST UNION HOSPITAL.

MR. PRESIDENT AND GENTLEMEN,—You are aware that several medical men have agreed with me in stating that cases of Asiatic cholera had been seen by us in Belfast, and I have thought my placing before you some information regarding these cases might be interesting, the more especially as one of them had struggled successfully against the disease in my hospital, and thus afforded an opportunity of noting particularly the course of his disease. I shall notice the cases in the order of their occurrence, premising that the three first cases resided very near each other, but that no intercourse could be traced:—

Case 1.—On the morning of the 10th of August I was requested by Dr. Murray, of Ballymacarrett, to see a dispensary patient, called Thomas O'Neill, aged 45, who had left Huddersfield on the 6th, in which town another Irish labourer, called Heard, died of cholera on the 12th. O'Neill spent the greater part of the 6th in Liverpool, where cholera was epidemic, arrived in Belfast on the 7th, but made no complaint of illness till diarrhœa set in at right P.M. of the 9th, followed by vomiting at two A.M. of the 10th, and by cramps at four. I saw him at nine; his eyes were sunken; the pupils half dilated, with a dark areola around the lids; his tongue cold, and voice husky and feeble; the hands were cold, blue, dry and shrivelled, as were also his feet; his pulse was barely perceptible, and the respirations hurried and noisy. The evacuations had all been thrown out.

We saw him again about one in the afternoon. He was then pulseless, less sensible, colder, and more livid, unable to open his mouth perfectly; there had been no more vomiting or purging, and the catheter found no urine. He died at two, about eighteen hours after he took ill.

The body was interred immediately, the house white-washed, and the clothing destroyed.

Case 2.—On the morning of the 12th, Dr. Murray asked me to see Edward McGowan, aged 40, living in Keenan's-court, a few yards from the house near Quinn's-entry, in which O'Neill had died. This man was attacked with diarrhœa at ten P.M. on the 11th of August, followed by vomiting at two A.M. of the 12th, and by cramps at

four, and Dr. Murray found him in a state of collapse at five. I saw him between seven and eight o'clock, when he was very blue, cold and pulseless, and he died about nine. All the evacuations had been thrown away in this case also.

Case 3.—When Dr. Murray was returning from McGowan's he was asked to see James McGowan, aged 27, living in No. 71, Short Strand-street, and believing him to be ill with cholera, requested future evacuations to be preserved. It happened that when I was looking for Edward McGowan's residence, I was taken to James' house, who was not related to Edward. James' bowels had acted at nine A.M. and four P.M. of the 11th, and he felt nauseated in the afternoon. He had taken during the day only one glass of whisky. He went to bed at nine, began to vomit about one A.M. of the 12th, and diarrhœa set in at once with profuse and very frequent evacuations. No urine was passed after three o'clock, and the cramps set in about eight. Through Dr. Murray's foresight, I was enabled to see an evacuation, which was almost colourless and distinctly "rice-water" in appearance. He consented to enter the cholera ward of my hospital, and was removed there in the recumbent posture about nine o'clock.

On admission his pulse was 120 and feeble; his nose and tongue were cold; his voice husky and feeble, and his hands, limbs, and scrotum livid and cold; his eyes sunken and surrounded by a dark areola, and his pupils half dilated.

He was placed in a warm bath for twenty minutes at 103 F., which gave him great relief, and was well rubbed with hot towels on leaving it; then clothed in a long flannel shirt, and had his arms enclosed in long ribbed woollen gauntlets, vessels of hot water placed in his bed, and large sinapisms applied along the entire spine and over his epigastrium. He expressed himself often as being greatly relieved by the warm bath, which also improved the temperature of his body and tongue, and gave volume to his pulse.

He got at once ten grains of calomel and three of opium, and was directed to take ten grains of calomel every hour for four doses.

Positive orders were given that in addition to the calomel, he was to be allowed to take nothing into his stomach except a tablespoonful of water every half hour, because I had so repeatedly found such directions beneficial in allaying the vomiting of English cholera, and of the Relapsing Synocha fever, that I invariably endeavour to enforce them when treating Asiatic cholera.

My wishes were most efficiently carried out by my assistants, Drs. Farelle and Lindsay, and the patient willingly co-operated.

No vomiting took place till four in the afternoon, so that the medicine had remained on an absorbing surface for seven hours.

A report of his condition was taken every two hours during the day and night by my very intelligent assistants. I shall not trespass on your time by reading them in detail, but confine myself to placing before you a condensed summary of them as entered by myself in my morning and evening reports:—

I learned at nine in the evening that he had vomited a greenish fluid repeatedly between four and six o'clock, that at the latter hour his pulse was barely perceptible, and his hands cold and livid. These symptoms of increased collapse appeared to have been benefited by the use of small quantities of hot whisky punch, for I found his pulse 126, and of fair strength, his nose, tongue, feet, and hands warm and dry. The bowels had not acted since admission; he had passed no urine, and the catheter found none. He complained much of thirst and of his continued restlessness, and had suffered much from cramps.

He had now taken six of the ten-grain doses of calomel. He was directed to take ten grains every two hours for two doses, and then every four hours; to have large sinapisms over the epigastrium and the entire length of the

spine, and to take half an ounce of whisky in an ounce of milk every two hours, and if restless at one in the morning, to get two grains of opium.

At nine in the morning of the 13th his pulse was 126, feeble; his tongue, nose, and body warm and dry; his lower gums were coming under the influence of the mercury; he had vomited ten times during the previous twelve hours; had passed no urine, nor had his bowels acted.

The calomel powders were continued every four hours, and a drachm of blue ointment rubbed every four hours into each arm-pit, and iced whey given in small quantities as a drink.

At noon the bowels had acted three times, and there was bile in the evacuations. At six in the evening his pulse was weaker; his hands and feet cold and livid; he had vomited repeatedly a bright green fluid of acid reaction, and he was very listless and tossing much about.

At nine in the evening his pulse was 122, and feebler than in the morning; the bowels had not acted since noon; he had passed no urine, and the catheter again got none.

A blister was applied over the epigastrium, and he got some calcined magnesia in mint water; the inunction was continued, and a drachm of blue ointment, rubbed up with two ounces of olive oil, was injected into the rectum. The calomel, of which he had now taken 120 grains, was discontinued.

On the morning of the 14th his pulse was 114, feeble; and his hands, feet, and body colder, although his tongue and face were warmer; the bowels had not acted again, nor had he passed any urine; he had vomited a yellow fluid eight or ten times during the night; he was more drowsy, though still intelligent; his gums more under the influence of mercury, and his voice still choleraic.

At noon I found his pulse fuller and stronger, and his colour improved; he had only vomited twice; the bowels had not acted, nor had he passed any urine, although asked to do so. Every precaution had been taken to obtain any that passed when the bowels were acting, or at other times.

Believing that reaction had now really set in and that everything depended on a restoration of the urinary secretion, he was directed to take two drachms of the very efficient diuretic mixture* of the hospital every half hour in iced whey, and to have a large sinapism over his loins.

I need not say how gratified we all were to find at nine in the evening that after a suppression of the secretion of urine for eighty-four hours, he had passed one ounce about an hour before, having then used about eight ounces of the diuretic mixture. The urine was coagulable by heat and nitric acid, and became a dark or purplish colour on the addition of the acid. Professor Parkes states that this peculiar pigmentary discoloration on the addition of acids, the nature of which is not yet decided, is present with the first urine passed in all cases of Asiatic cholera, and that, in fact, it is the best diagnostic mark of the existence of the disease in doubtful cases.†

His bowels had acted twice; he had vomited a yellow fluid five times; his pulse was 110, and feeble.

The inunction was continued, and the mercurial enema repeated; a large sinapism kept on the loins till the skin was returned, and the body well rubbed with dry cloths every two hours.

On the morning of the 15th the pulse had fallen to 80, and was full and strong, and the temperature everywhere good; the respirations were now counted for the first time, and found to be 14; he had vomited eleven times, and had hiccup for several hours. The mercurial enema was returned without any fæces, and he was unable to pass any urine.

A pint of tepid water was thrown into the rectum,

where it remained for half an hour, and then passed off with fully a pint more of semi-fluid bilious matter, but unaccompanied with any urine.

At nine in the evening his pulse and respirations were the same, and his temperature everywhere good; he had slept much during the day and was very drowsy; he had vomited eight times, but retained several spoonfuls of bread and milk; the bowels had acted twice, and at half-past five he passed two ounces of urine of a sp. gr. of 1.015, acid, and slightly coagulable.

In the hope of re-establishing thoroughly the renal secretions, four ounces of whisky and eight ounces of the diuretic mixture were directed to be taken during the next twelve hours in a quart of iced whey, and some lemon juice given after his magnesia mixture, in the hope of checking the vomiting.

On the morning of the 16th his pulse was 84, full and strong, and the respirations 16; his tongue dry, his gums sorer; he had vomited nine times; taken his diuretic mixture, and retained a fair amount of his bread and milk; he had passed 13 oz. of urine during the night, neutral in its reaction, and of sp. gr. 1.014, slightly coagulable, and fætid when heated. The bowels had acted twice, evacuations viscid bile and some blood. Being still much oppressed, a blister ten by four was applied to the nape of the neck for four hours, and followed by a hot poultice.

At nine in the evening his pulse was 88, and respirations 16; the bowels had acted three times, first evacuation pure blood, the second composed of bile and blood, and the third less bloody. He had secreted seven oz. of urine, which was alkaline, sp. gr. 1.015, and with a trace of albumen. Believing that the blood indicated a congested condition of the intestinal tract, he was directed to take half an ounce of castor oil during the night.

On the morning of the 17th his pulse was 90, and respirations 18; the evacuations from the bowels were bloody and scanty, but he had passed 30 oz. of urine during the night, which was alkaline, sp. gr. 1.015, and free from albumen, but fearfully fætid on being heated. On this day the vomiting ceased and did not return, and the evacuations from the bowels ceased to be bloody.

On the 18th I found that, notwithstanding the secretion of 63 oz. of urine during the previous twenty-four hours, his pulse was only 86, and his respirations barely 16. He had passed one yellow evacuation free from blood, and complained of being drowsy; his pupils were dilated and there was some muttering delirium.

A blister was applied over the forehead, and he was directed to take twelve forced inspirations every half hour, with the object of dilating the lungs to their fullest extent, and thereby purifying the blood. I decided also on establishing a freer secretion from the intestinal surface by the daily administration of castor oil.

On the 19th his pulse was 88, his respirations 16. The bowels had acted five times, without any blood, and he secreted 105 oz. of urine during the previous twenty-four hours, acid, of sp. gr. 1.010, and not coagulable. He was more sensible; his memory improved, and he was free from delirium; his tongue moister and cleaner. The blister rose well, and Professor Cuming very kindly ascertained for me that the serum of the blistered surface contained a larger proportion of urea than recent experiments have shown to be always present in the blood.

The forced inspirations, castor oil, and diuretic mixture were continued, and he had fowl broth, with a large amount of parsley in it.

On the 20th his pulse was 86; the respirations 18; the bowels had acted five times, evacuations fluid and bilious; he had passed 95 oz. of urine in twenty-four hours, acid, and of sp. gr. 1.010, and faintly coagulable; but his tongue had again become dry, and there was some delirium. In addition to the other treatment he was now directed to take 2 oz. of green tea during the next twenty-four hours, infused in a quart of water.

On the 21st his pulse was 80, and the respirations 18; the bowels had acted five times, and the evacuations were very

* Composed of the bicarb. soda, acetate of potash, liquor potasse, tartaric, citric, and acetic acids, and oil of juniper in water.

† Parkes on the urine, p. 307.

yellow; he had passed 111 oz. of urine during twenty-four hours, sp. gr. 1.014, acid. There was no delirium; he felt better, and his intelligence was improved. His castor oil, green tea, diuretic mixture, and forced inspirations, were continued.

On the 22nd the pulse was 84, the respirations 19; the bowels had acted four times; he had passed 120 oz. of urine during the previous twenty-four hours, acid, and sp. gr. 1.010. Same treatment continued.

On the 23rd his pulse was 89, respirations 16; bowels had acted four times; the urine amounted to 102½ oz., acid, sp. gr. 1.013; his intelligence had improved much, and his tongue was clean and moist all over. No change in treatment, except that he was allowed to leave bed.

On the 24th his pulse and respirations were about the same; his bowels had acted six times, and he had passed 125 oz. of urine, and was declared convalescent.

Case 4.—This patient was a female, called Sinclair, aged 38, who was admitted into hospital from Hudson's-entry, at seven P.M. of the 17th August. She stated that she had been attacked with diarrhoea at five A.M. of the 15th, followed by vomiting at nine, and that cramps were associated with these symptoms on the forenoon of the 17th. She had been seen by the dispensary medical officer, Dr. Rea, about two, who directed her removal to hospital. On arrival she said that her bowels had been very loose during the day till about five o'clock, that she had vomited four times, and had the toes separated from each other by the cramps. She was pulseless at the wrists, her tongue was cold, her nose cold and livid, and her voice feeble. Her eyes were sunken and surrounded by a dark areola, and the pupils rather dilated.

She was placed in a warm bath, which for a time improved the heat of the body, and made her tongue warm. On leaving the bath she got ten grains of calomel and three of opium; had sinapisms applied along the entire spine and over the epigastrium, and was clothed in a long flannel chemise, and ribbed woollen gauntlets over her arms, dry friction applied to the extremities, and pans filled with hot water placed in her bed.

At nine P.M. she was still pulseless; the hands, arms, body, and feet were warmer, but the face, the nose, the tongue, and the breath were cold; she had retained three ten-grain doses of calomel, the two last of course without opium; she had not vomited, nor had the bowels acted.

Ten grains of calomel were directed to be given every four hours, and a teaspoonful of whisky with a table-spoonful of iced whey every half hour.

At eleven P.M. she passed a scanty evacuation, of the consistency of gruel and a pale drab colour, but no urine.

On the 18th she remained pulseless, with her hands cold, livid, shrunken, and sodden, and her feet warm. Her tongue and breath were cold; she had neither vomited nor passed urine since admission, nor did the catheter get any; the pupils were rather contracted; her intelligence perfect; the areola continued around the eyelids, and she had suffered severely from cramps in her legs during the night.

The treatment was continued.

At noon she was still pulseless, but less intelligent; she had a slight convulsion before her death, which took place about four.

This patient was seen in the hospital by Drs. Murney and Johnstone, who agreed with me that it was a case of Asiatic cholera.

Case 5.—I was requested by Dr. Porter to visit one of his dispensary patients about noon on the 11th of September, whom he believed to be suffering under Asiatic cholera.

He lived at No. 6, Bow-street, Belfast, was called Patrick Wilson, and aged 50. I learned from the very accurate and minute notes taken by Dr. Porter, that he had been attacked with diarrhoea at two in the morning, followed by vomiting at eight, and soon afterwards by cramps. When I saw him his voice was husky and feeble; his tongue and breath cold; pulse barely perceptible, and

his eyes sunken, with a dark areola around the lids; his hands were cold, blue, and shrivelled, and the cramps very severe.

I had no hesitation in ageing with Drs. Porter and Henry Johnstone that this man was suffering under Asiatic cholera. I recommended his removal to hospital, as he was lying on straw in the corner of a room in which there was no fire. He consented to go; but when his friends saw the kind of conveyance sent to remove him in, they would not allow him to enter it.

Dr. Porter attended to him most sedulously, and did everything in his power to promote his recovery. Various attempts at rallying took place, but in the evening he was found pulseless, colder and more livid, and less sensible; and he died about one in the morning of the 12th, twenty-three hours after he took ill. At one of Dr. Porter's visits he saw a distinct "rice-water" evacuation. He passed no urine after eleven A.M. of the 11th. Nine hours after death Dr. Porter found his hands, wrists, and face of a bluish colour; his ankles and parts of his legs purple, with some blue spots on his toes, and his chest still warm.

Case 6.—Since the foregoing histories were read before the Medical Society, a woman called Rose McCullough, aged 40, was admitted to hospital at 7 P.M. of the 9th October; she had been drinking for several days before the 5th, when diarrhoea and vomiting commenced. On admission her skin was cold, as also her tongue, eyes sunken, with a dark areola, pulse 126. She stated that she had felt pains in the calves of her legs and hands; but as she did not call them cramps, and the symptoms being less intense than in other cases, I did not pronounce her at first to have Asiatic cholera, and after giving her a warm bath, I administered the medicines used in Case 3, but less frequently. The bowels had become quiet, but the vomiting was very frequent.

The catheter obtained half a drachm of urine, which on being examined on the morning of the 10th was found to be acid, not coagulable, but gave with heat and nitric acid a distinct brownish colour. This discoloration alarmed me, as Parkes' opinion of its diagnostic value, already quoted, had been supported by Case 3.

I shall not detail the reports taken every two hours, but limit my notice of this case to stating that the symptoms became gradually more intense, till she died in unmistakable collapse at one o'clock of the 11th. Rigor mortis occurred in fifty minutes. The vomiting had continued most distressing. The bowels acted only three times after admission, and then scantily. The secretion of urine was also very scanty, the catheter never obtaining more than three drachms, which was found coagulable on every occasion but the first, acid in its reactions, and gave always a dark or purplish discoloration with nitric acid and heat.

I am so impressed with the importance of this discoloration of the urine, that I trespass on your space with a very brief notice of some other cases, which corroborate the opinions of Professor Parkes and Dr. Warburton Begbie of its diagnostic value.

Case 7.—A boy called Peter Carty, aged 8, was admitted into my hospital at midnight of the 14th October, from the same locality in which McCullough had lived, but no intercourse was traced. I saw him about an hour after admission, and found him pulseless, cold, livid, and with all the symptoms of collapse, after sixteen hours' vomiting, diarrhoea, and cramps. The catheter got no urine till about noon of the 15th, when a few drops were obtained, which being placed on white paper was found acid, and gave a distinct purple colour with nitric acid.

He passed into the stage of consecutive fever. The urine was tested on every occasion it was obtained by the catheter, or passed by himself, and was invariably found coagulable and giving discolorations varying from pink to dark purple. The urinary secretion was restored to the extent of eight ounces daily, and a profuse discharge also of bile; still he became gradually less sensible and died.

Anne Downey, aged 54, who had suffered from renal dropsy, was sent into hospital in consequence of having had vomiting and diarrhœa for two days, without cramps, but with great failure of the heart's action; ultimately becoming pulseless and cold, death taking place twenty-nine hours after admission.

Dr. Warburton Begbie, in his paper in the *Edinburgh Journal of Medicine* for November, 1849, states, "that he had examined the urine in cases of diarrhœa, and so-called choleroïd diarrhœa; and had never found albumen, epithelium, and bile in such cases," bile being at that time considered to be the cause of this discoloration of the urine.

In Downey's case her urine was examined, and found acid, albuminous; but no discoloration followed the tests applied in the other cases. This case was not returned as one of Asiatic cholera, as I believe that renal disease was the cause of her death. Rigor mortis had not commenced at the end of two hours.

HÆMORRHŒA.

"SEROSEA EPIDEMICA."

SYMPTOMS AND TREATMENT OF.

By J. LENEY, Surgeon, Bray.

THIS disease, known by the following names—viz., Asiatic cholera, pestilential cholera, pestilential asphyxia, spasmodic cholera, Indian cholera, epidemic cholera, nervous cholera, &c., is decidedly an epidemic passive serous hæmorrhage, as the name I propose indicates.

I look on this disease not only as epidemic, but also contagious, and propagable to a certain extent from concurrent and aiding causes, unhealthy constitutions of the air, intemperance, poverty, and insufficient clothing, numbers crowded in close and unhealthy located dwellings; the blood being thus deprived of its vivifying principles, a predisposition arising from great fatigue and mental depression, or to persons more especially labouring under chronic dyspepsia, diarrhœa, or dysentery. To those so circumstanced a small amount of the poison inhaled from the atmosphere, or arising from the body of a patient labouring under the malady, is capable of producing the disease in a mild or grave form, proportionate to the constitutional vigour of the individual at the time. In the years 1831 and 1832 the miasma lighted on this district as a poisonous cloud, infecting all predisposed simultaneously. Antecedent to the year 1849, I had doubts as to this disease being infectious; but in April of that year the first case that occurred in this neighbourhood was that of a woman, aged 66 years, Catherine Doyle; she died after twenty-four hours' illness. Mary Neil, who lived in a cabin at a little distance, was in the cabin of Catherine Doyle soon after the death of the latter; she instantly felt a sense of nausea, became faintish, and vomited. This woman died of hæmorrhœa in its most aggravated form after an illness of thirteen hours. William Neil, aged 13 years, son of Mary Neil, who had suffered from dysentery for the past three days, was seized half an hour before his mother's death with the disease in all its intensity, and died after an illness of thirty hours. Mary Neil, sister of William Neil, aged 17 years, who slept in the bed in which her mother and brother died, sickened on the day of her brother's death, and died in sixteen hours. These cases, furnished by me to the late Dr. Graves, were published by him in the *Dublin Quarterly Journal*, as strongly conclusive of the infectious type of the malady. John Neil (husband of Mary Neil), and three younger children, being sent to the poor-house when the mother took ill, escaped the malady.

The pestilence did not reappear in Bray till August of same year, when I saw still more marked instances, if possible, of the contagious character of the disease. Then I had an opportunity of seeing persons struck down nearly inanimate by the concentrated infectious effluvia escaping from the bodies of the sick confined in close rooms, and death following in a few hours. A strong proof of the infectious character of the disease is this: bring a person from an uninfected district into the room of a patient labouring under hæmorrhœa (unconscious of the disease the man labours under), immediately he remarks the sickly odour, complains of oppression of the chest and nausea; now show him the patient, tell him it is cholera. Observe him now, "how pale he glares," more than probable he is seized with the pestilence in its most hopeless form, but some will say that was the effects of fright; no, fright may cause syncope, or micturition, or relaxation of the sphincter ani and its consequences, but certainly not hæmorrhœa had the man not previously inhaled the morbid poison.

Further, observe now the persons arriving from Liverpool with the "zume" in them. This leavened on their arrival, and communicated to their attendants.

Hospital Reports.

SPECIAL REPORT

ON THE

TREATMENT OF CHOLERA BY VENOUS INJECTIONS.

I.

ORIGIN AND HISTORY OF VENOUS INJECTIONS AND TRANSFUSIONS.

EVER since the great discovery of Harvey, men's minds seem to have recurred at intervals to the possibility of introducing medicinal substances directly into the circulating fluid, as well as of renewing it by the transfusion of fresh blood into the veins; and indeed we may date the *idea* still further back, for classical authors tell us of Medea restoring youth to Æson by drawing away from his veins his old blood, and refilling them with the juices of certain plants. But for all practical purposes we may commence the history of venous injections and transfusion with Harvey's discovery, which demonstrated the possibility of performing these operations, and even showed the manner of carrying them out. It is singular that everywhere the injection of medicinal substances into the veins preceded what may be thought the more natural process of the transfusion of blood, and that, as will be seen in the sequel, these substances were often of the most inappropriate nature, the only wonder to modern inquirers being that so many cases escaped death from the remedy.

The first record of actual venous injections we have been able to trace, was that of a German sportsman, who as a mere amusement injected wine and brandy into the veins of his dogs. These animals suffered no evil consequences after they had slept off the effects of the alcohol thus cruelly forced upon them. Nevertheless, the experiment, though undertaken as an amusement, resulted in proving an important physiological fact. We find transfusion proposed by Potter as early as 1638, but the proposal was not carried out.

In 1656 Sir Christopher Wren injected into the veins of a dog a solution of opium in sherry wine. The experiment was made in the presence of Boyle, who relates that after a certain stupor the animal perfectly recovered. Some time afterwards, Boyle injected the crocus antimonii into the veins of a criminal, and he recommended a trial

of cordials, antidotes, and diuretics in this manner, considering that potent drugs were inadmissible. A little later, Clarke employed milk, beer, whey, and broth. He also tried to introduce blood in this manner, but without success.

In 1666 Dr. Lower successfully effected the transfusion of the blood of one dog into the circulation of another, by connecting the cervical artery of one directly with the jugular vein of the other. At the same time he allowed the blood of the receiving dog to escape in proportion to the quantity transfused, and continued the experiment until the animal had lost and replaced a quantity of blood equal to his own weight. At the conclusion of the operation the dog jumped down from the table and behaved in every respect as if well, nor did he exhibit afterwards any symptom of having suffered.

From what has preceded, it appears that our own countrymen were the pioneers who first placed this method on a sound foundation. It was not long, however, before the French took up the question, for in 1667 M. Denis successfully transfused small quantities of the blood of calves and lambs into the veins of five human beings. Then began a virulent controversy; some of the opponents of Denis asserted that one of the persons who had submitted to the operation died, and legal proceedings were commenced against the successful Denis, but he not only defeated his enemies by his defence, but afterwards received the appointment of physician to the King. It was, however, decreed that the operation should not be performed without the sanction of a member of one of the Great Faculties. Denis transfused the blood of animals into the veins of several diseased persons, and witnessed the wonderful effects that immediately followed. In one case, at the solicitation of friends, after the relapse so often witnessed, he repeated the operation which had previously produced an amendment lasting twenty-four hours. The second time it only gave twelve hours further improvement.

From this time transfusion seems to have been utterly neglected in France, and as to injections, only such substances were employed as could only inevitably bring about a fatal result; yet the intense interest that had been excited was not altogether lost through the opposition that transfusion encountered at Paris, and the neglect by which this hostility was succeeded. In our own country the subject still occupied attention, and numerous experiments were made upon animals to determine the effect of medicinal substances introduced into the circulating fluid. These experiments proved that opium in small quantities, diluted alcohol, salt, sugar, and even vinegar, might be thus introduced without evil consequences—that certain drugs thus employed gave rise to their usual effects when taken into the stomach, while not a few substances were rapidly fatal. Among these were undiluted alcohol, camphorated spirits, tincture of hellebore, salt-petre, sal-ammoniac, alum, olive-oil, &c.

In 1667, Dr. King injected into the veins of one Coga, a Cambridge student, reported to be mentally deficient, and who volunteered for the purpose, nearly twelve ounces of calf's blood. The operation having given rise to no evil effects, and equally having failed to affect his mental powers, was again resorted to after an interval of three weeks, and with the same results.

At this period Germany was equally interested in the matter, and the following year Major passed some liquid into the veins of a patient who recovered. Next in order in Germany come the experiments of Elsholz, who proceeded much more carefully, and was very successful. He relates three cases in which he introduced from half an ounce to an ounce of medicinal liquids into the veins of his patients, who afterwards recovered. Whether the *post hoc* in these cases fairly represents the *propter hoc*, we do not feel called upon to decide. Suffice it to record that this experimenter recommended the employment of the method to introduce stimulants into the system for syncope. He also suggested injecting refrigerants for

fever, and conjectured that apoplexy, hysteria, and consumption afforded proper subjects for a trial.

Garman recommended transfusion after profuse hæmorrhage; he also proposed injecting a few drops of wine into the umbilical vein of still-born infants. He tried this experiment on a puppy, which recovered.

Fabricius introduced eight grains of scammony, in three drachms of tincture of guaiacum, into the veins of a soldier suffering from secondary symptoms. The remedy produced vomiting, after which the patient recovered. Other cases were injected with similar success by Fabricius, including epilepsy, apoplexy, and rheumatic gout.

About this period some most extraordinary ideas prevailed as to the effects likely to be produced by this agent. We have already hinted that it was half expected to improve the mental condition of one patient. There were not wanting writers who thought that kings might have wisdom imparted through their veins. Kauffmann told of a "sheep's melancholy" having occurred in some patients into whom he had injected sheep's blood, and even Elsholz proposed the transfusion of a little of the blood of the husband into the wife's veins, and a reciprocity on the part of the wife; in fact, a mutual exchange of a few ounces of blood as a cure and preventive of matrimonial jars.

However much it may be regretted that no such hope of a panacea, physical and moral, remains to humanity, it is scarcely to be wondered at that the effects of a remedy endowed with such surprising powers should have given rise to conjectures and beliefs, which, after all, were only in accordance with the ideas of the times.

Next in order come the experiments of Purmann, who, in 1670, had *aqua cochlearia* injected into his own veins for a skin disease. He fainted during the process, and afterwards suffered from suppuration of the vein, but that he still had faith in the method is proved by his submitting to it at a later period for ague and dysentery of long standing. On this occasion he used the *aqua cardui benedicti*, and he recovered in a few days without any ill effects. After this he injected small quantities of alcohol, ammonia, and vegetable infusions into the veins of three epileptics. Each case was successful.

In 1691 Müller having injected mercury into the veins of animals found points of suppuration around the metallic globules in the lungs. The same result was noticed by Dr. Haighton in 1799, and at a more recent date by Cruveilhier.

Italy claims the honour of having employed this method in numerous physiological investigations. Baglivi found that the injection of cold water produced rigors. He also discovered the fatal effects of air being admitted into the circulation.

In 1721 the plague was communicated from man to dogs by injecting the contents of a gall bladder into the veins in the course of some experiments respecting the state of the bile in that disease.

In 1778 Regnandot described a case of leprosy which he believed he had cured by venous injections of senna and guaiacum suspended in mucilage.

In 1785 Fuller proposed injection for restoring persons from drowning. This idea was followed up by Meckel, who to induce reaction by vomiting, injected two grains of tartar-emetic in a case of attempted suicide by drowning.

Valisnieri a little later relates the cure of a viper bite, in which the symptoms were desperate, by an injection of a teaspoonful of hartshorn.

In 1776 the production of vomiting by this means saved the life of a man who was dying from the impaction of a piece of meat in the œsophagus. Kohler, who had seen the effects of venous injections in some experiments of Lieberkühn's, having been called to this case, injected six grains of tartar-emetic into the veins. After a time the meat was rejected by violent vomiting, and the man recovered.

In 1784 a military surgeon of Potsdam, named Balck, who seems to have heard of Kohler's success, carried out the same plan. Being unable to dislodge a large piece of

flesh from his patient by the probang or other means, when he considered the man to be dying, Surgeon Balck opened the right median cephalic vein and injected a solution of tartar-emetie. This occasioned the speedy expulsion of the meat by violent vomiting, which continued afterwards, and for which ether and laudanum were given. The man speedily recovered from the weakness induced. A couple of years later the same surgeon had the good fortune by the same means to save the life of a woman imperilled in a similar manner.

In 1796 Knopf was equally successful in similar circumstances; his being thus the fourth recorded case of this nature.

In 1816 a fifth case of this kind was equally successful under Græfe, of Berlin.

By the period to which we have now arrived in this brief sketch of the history of the method, more rational views had begun to prevail than those noticed in a former digression from the strict chronology of facts. Thus we have next to record that Hemman looked upon those medicines only as adapted for the purpose which are readily miscible with the blood, and cause no sensible change in its appearance. This is so rational a notion that we feel surprised it had not been previously insisted on.

Hemman, acting upon this idea, injected into the veins of an epileptic girl a solution of musk in water. The catamenia, previously suppressed, reappeared and the girl recovered. On another occasion he injected a carefully prepared and thrice filtered infusion of bark, to which a minute quantity of spirit of ammonia had been added, in the case of a man in a hopeless condition, on the twelfth day of typhus. Three ounces of the fluid were injected; after about half an hour some colour returned to the face, the pulse rose, and the skin became bedewed with perspiration. Three hours afterwards the coma passed off, and the patient took some wine. Then came a relapse; the pulse fell; the skin again became dry, and restlessness, and then delirium ensued. The relapse continued the next day, but Hemman, encouraged by the effects of his former injection, persevered. This time he used the "essential salt of quinia," dissolving one drachm in four ounces of distilled water, and, after repeated filtration, adding fifteen grains of carbonate of ammonia. Of this he succeeded in injecting three ounces, having previously allowed four ounces of blood to escape from the vein. An hour afterwards the pulse had risen; then free perspiration came on. The same night offensive diarrhoea took place; but from this time the patient continued to improve; nothing except a trifling suppuration at the bend of the elbow having occurred during convalescence.

Before the close of the century a drachm of infusion of tobacco had been injected by Lynn into the veins of a horse affected by tetanus. It was thought to give relief, but the horse died before it was repeated. Besides this, Viborg, of Copenhagen, made a number of useful experiments respecting the production of vomiting and perspirations in animals in which these are not easily excited.

Moreover, Darwin had suggested transfusion in stricture of the esophagus, but this was not carried out.

Early in the present century Ortel, of Leipsic, was engaged on the subject, and employed camphor triturated with mucilage, both of them very inappropriate substances, and likely to cause mechanical obstruction in the circulation. Nevertheless, some patients recovered from both disease and remedy.

A considerable number of patients in the Charité Hospital at Berlin were treated by this method by Drs. Hufeland and Horn without a single fatal result, but we have not met with any details of the cases.

MM. Percy and Laurent, in an article on this subject in the *Dictionnaire des Sciences Médicales*, state that of eight cases of tetanus injected by them five completely recovered, and that at a time when to save any one in this disease was the exception. The substances injected comprised wine, bark, digitalis, stramonium, and valerian.

In 1820 a girl was successfully treated for epileptic apoplexy by tartar-emetie, injected by Krahe of Berlin.

Majendie next took up with the method, and injected a quart of tepid water in a case of hydrophobia. The injection was followed by a complete state of calm, which lasted a week, and although the patient afterwards died, such relief as this could not but stimulate to further trial. It showed the safety of a large injection of liquid at the temperature of the blood. Henceforth it only remained to learn that fluids of different densities could not safely be brought in contact with the blood globules. Some other efforts were unsuccessfully made to arrest hydrophobia in this manner by Froriep and Gaspard, the former of whom used an infusion of belladonna.

M. Coindet injected poppy juice in a case of hysterical trismus, and M. Meplain tartar-emetie, as a vermifuge in a case of convulsions. Both patients did well, although the propriety of resorting to venous injections, in such instances, will scarcely be admitted.

This brings us to the well-known labours of Dr. James Blundell, of Guy's Hospital, on the subject of transfusion, whose success in rescuing a woman from flooding gave a fresh impetus to this method, and enabled others who followed him to snatch similar successes. Transfusion had, indeed, before this been tried at Guy's, by Dr. Chalmers, but with only a very brief benefit, the case selected having been schirrus of the pylorus, and, therefore, one in which it can scarcely be considered justifiable.

We have now traced the history of venous injections down to the period when a new impulse was given to this mode of treatment by the proposal to try it in the collapse stage of cholera.

Those who may desire to investigate the earlier history in a more systematic manner will find many interesting particulars in the writings of Dieffenbach, Scheel, Birch, and the authors we have already cited. An admirable and learned sketch of this part of the subject was also given by Dr. Little, of the London Hospital, in his oration before the Hunterian Society in 1852, to which, indeed, we are indebted for some of the facts above mentioned.

The labours of this physician will, however, demand prominent mention in the succeeding portions of our report.

CORK-STREET FEVER HOSPITAL.

TYPHUS FEVER, WITH ENTERIC SYMPTOMS TERMINATING IN CHOLERA: RECOVERY.

By THOMAS WRIGLEY GRIMSHAW, M.B.,

ONE OF THE PHYSICIANS TO THE HOSPITAL; LECTURER ON MATERIA
MEDICA IN STEEVENS' HOSPITAL.

DURING the months of August and September of this year a number of cases were admitted into Cork-street Hospital, where choleraic diarrhoea occurred as a complication of typhus; in fact, the typhus in many cases seemed to have the malignant symptoms of cholera added to its own. Several of these cases occurred under the care of my colleagues, Drs. Kennedy and Mason, especially the former. The number of cases of enteric fever, or of typhus fever with enteric symptoms, such as are familiar to your readers through the paper of Dr. Kennedy, which appeared in THE MEDICAL PRESS AND CIRCULAR of June 20th, 1866, was much greater than usual. The following case, however, is of rare interest, as it exhibited well marked typhus with enteric symptoms, and finally became a case of well marked cholera, with all the symptoms of that disease:—

John Reddy, aged 15 years; admitted into hospital on September 21st, the tenth day of his illness. His father died of cholera on the 20th (this fact was not ascertained by me for several days after the boy's admission, nor was it known to the patient himself until his recovery); densely maculated.

22nd. First seen on this the eleventh day of the disease; maculae very numerous and dark; complains much of his head; bowels regular, but had been confined; temperature 104° ; respiration 46; pulse 120, with the character usually found in some typhus cases at this stage of the disease (see fig. 1):—

Fig. 1.

Ordered two leeches to each temple, infusion of tea,* three ounces every three hours.

22nd day. Says he is better; headache gone; spots same state; temperature $104^{\circ}5$; respiration 24; pulse 90, but not of the character usually found in typhus at this stage of the disease (see fig. 2). Continue infusion of tea.

Fig. 2.

13th day. Worse; diarrhoea, characteristic of enteric fever; pain and gurgling on pressure in the right iliac region; no pain elsewhere; no rose spots can be discerned; temperature 103° ; respiration 26; pulse 108, of the same form as yesterday (see fig. 2). Ordered dilute sulphuric acid, to be added to the infusion of tea.

14th day. Spots less distinct; symptoms of cholera, vomiting, purging, cramps in legs, hollow eyes, and sunken countenance; temperature $99^{\circ}5$; respiration 34; pulse 90, distinct, but of higher tension than yesterday (see fig. 3).

Fig. 3.

Ordered infusion of tea as before, beef-tea, wine ten ounces, whisky two ounces; sinapism to epigastrium; lead and opium pills, eight grains every three hours; infusion of mint with hydrocyanic acid, 30 minims to eight ounces, an ounce to be taken every third hour until vomiting ceases; hot jars to feet.

15th day. Cholera symptoms continue; temperature 97 ; respiration 36; pulse 84; high tension (see fig. 4).

Fig. 4.

Continue same treatment as yesterday, whisky four ounces in punch as before.

16th day. Collapsed; diarrhoea and vomiting have ceased; breath cold to hand held before the patient's lips; temperature of breath 73° , temperature of ward being 60° ; spots same as yesterday; temperature 96 ; respiration 24; pulse 60, of much the same character as yesterday (see sphygmogram, fig. 5).

Fig. 5.

Ordered infusion of tea to be taken hot; calomel and opium pills; whisky six ounces in hot punch; extra blankets and hot jars.

17th day. Same state as yesterday; spots fading; temperature 96° ; respiration 30; breath slightly warm; pulse 84, of same form as yesterday (see sphygmogram, fig. 5); bowels not moved since yesterday; no urine passed. Ordered tea, wine, and punch as before; stop pills; calomel five grains.

18th day. Worse; pulse not to be felt at wrist; no

* The infusion of tea is made by infusing three ounces of tea in one pint of cold water for twenty-four hours.

sphygmogram could be taken; respiration regular; breath cold again; parotid gland swollen; appears to complain of head and stiffness in neck; passed urine. By Dr. Kennedy's advice leeches were applied behind the ears, and a small blister to the nape of the neck; ten grains of camphor were given to procure sleep; whisky, wine, and tea, as before.

19th day. Better; breath warm; parotid swelling increased in size; hypopyon and commencing ulceration of both corneae; respiration quick and irregular; temperature 100° ; pulse 120, irregular (see fig. 6). Speaks

Fig. 6.

and tries to put out his tongue. Same treatment as yesterday, except calomel; eyes to be washed with milk and water.

October 1st, 20th day. As I was going off hospital duty, the patient was transferred to the care of Dr. Mason. Much better; corneae much the same state; speaks well; temperature 100° ; respiration 30; pulse 120; sphygmogram of nearly natural form (see fig. 7). Continue same treatment.

Fig. 7.

21st day. Decidedly better; pus found in parotid swelling; ulceration of corneae healing; temperature 100° ; respiration 24; pulse 90, similar in form to yesterday (see sphygmogram, fig. 7); whisky four ounces, other treatment same as before.

22nd day. Rapidly improving; respiration 24; temperature $99^{\circ}5$; pulse 90, of natural form (see fig. 8).

Fig. 8.

From this date the patient rapidly improved; the abscess in the parotid burst on October 5th, and the patient was considered convalescent on October 8th.

27th day. The range of temperature in this case, given in the annexed diagram, fig. 9, is remarkable, varying

Fig. 9.

from $104^{\circ}5$ on the 12th day to 96° on the 16th day, and again rising to 100° on the 19th day, from which it fell to natural by very slow degrees, through a considerable period. The temperature towards the end of the cure seems to have been kept up by the irritation of the parotid abscess, and an unhealed blister on the epigastrium.

MATER MISERICORDIÆ HOSPITAL.

CLINICAL REPORT.

By Dr. HAYDEN.

CEREBRO-SPINAL ARACHNITIS.

Case 1.—Anne A., a delicate looking child, aged 13 years, was admitted into hospital, June 25, 1866. Nine weeks previously she had been suddenly taken ill with acute pain in the head and left side of the neck, and extending to the arm and leg of the same side; these parts were tender on pressure; there was bilious vomiting; and from the outset of the attack partial loss of consciousness; she was leeches and blistered by her medical attendant, by whom, it would seem, the nature of the disease was identified. When two years old, according to the report of the mother, the patient suffered sudden impairment of vision in the right eye, consequent on fright; the pupil of that eye at the date of admittance was contracted and fixed, as if by adhesion of the iris to the lens; it was likewise somewhat hazy, and there was partial convergent strabismus and imperfect vision on the same side; the patient was weak, suffering from diarrhoea and occasional sickness of stomach; there was great emaciation, total loss of appetite; quick and feeble pulse; the cutaneous surface, especially over the angles of extension of the joints, was remarkably rough and desquamating; tongue coated at the edges, and denuded of epithelium and red along the centre; muscular pains were complained of in the left arm and leg, which were greatly wasted and acutely sensitive to pressure; there was occasional pain in the head. The case was reported to me as having been one of gastric fever with great wasting and consecutive debility; the patient was put upon mild bitter tonics and astringents, liquid diet, and a moderate allowance of wine; under this treatment she seemed to have made some progress when, on my morning visit to the hospital, Saturday, July 7, I found her partially unconscious, the left pupil slightly dilated and imperfectly sensible to light; severe pain was complained of in the head and neck; a blister was directed to be applied to the nape of the neck and the blistered surface to be dressed with mercurial ointment; hydrarg. c. creta and James's powder, of each one grain and a half, to be given every second hour, alternating with a dessert spoonful of wine. On the following day, July 8, the patient was totally unconscious, the left pupil widely dilated and insensible; pulse 144; skin hot; deglutition unaffected, powders to be continued and ʒi. of mercurial ointment to be rubbed into the axillæ morning and evening.

July 9th. Patient is much improved, can now recognise those around her and answer questions coherently; pulse 138; left pupil normal; treatment continued.

July 10th. Pulse 126, slight convergent strabismus of both eyes; left pupil somewhat dilated; patient's mind is not quite collected, and she cannot answer intelligibly questions relating to her condition; vomiting occurred once this morning, the ejecta consisting only of the food taken; there is slight diarrhoea; head to be shaved and blistered, and afterwards dressed with mercurial ointment; powders to be stopped, and wine and nutriment continued.

July 12th. Pulse 124; left pupil dilated; right pupil examined with a magnifying glass is seen to be irregular by adhesion of the iris to the lens, which is slightly opaque.

July 16th. Progressing favourably; appetite and sleep good; tongue clean; no pain in head or limbs; left pupil still slightly dilated; continue.

July 17th. Vomited once this morning; pulse 114; left pupil less dilated; gums red and swollen, and teeth dark; "tooth-line" on inner surface of left cheek; stop mercurial inunction; otherwise continue.

July 20th. Pulse 102, of good volume; appetite improved; to take one-and-a-half gr. sulph. quinine three times daily; six oz. of wine, and chicken for dinner.

July 21st. Stomach sickened last night; bowels confined; to have castor oil draught.

July 29th. Since last report patient has progressed most satisfactorily; pulse is now 96; tongue clean; left pupil normal; appetite improved; stomach no longer irritable; no pain in the head or extremities; is discharged to-day restored in all respects save as regards strength.

I have reported this case in detail, as it appears in my notes taken from day to day, because I believe it presents a typical example of cerebro-spinal arachnitis, of a sub-acute form, followed by relapse eleven weeks after the primary attack; affording very little hope of ultimate recovery, and reducing the patient to a degree of emaciation seldom witnessed.

The most characteristic features of the case were the muscular pains, chiefly in the legs; the rough and scabrous condition of the integuments; the tetanic fixation and partial retraction of the head and neck; dilatation of the pupil not fixed by adhesion; partial loss of consciousness, dry, red and crusted tongue, and irritable stomach.

It was, no doubt, the presence of the two last mentioned symptoms that led the child's friends to regard the disease as gastric fever. The synechia in the right eye was the result of iritis; and although I failed to obtain a history of syphilis in the parents, I am disposed to regard the iritis as due to a syphilitic taint by hereditary transmission, owing to the general defect of growth and nutrition which the child exhibited, and the absence of a history of acute inflammation in the eye. If this view be correct an interesting question arises—namely, whether the meningeal inflammation was not of a similar character, and due to the same cause?

Case 2.—Christopher Byrne, aged 30, a labourer employed in repairing the road in the neighbourhood of Blackrock was admitted into hospital Feb. 2nd, 1865. A day or two previously, whilst engaged at his work, he was suddenly attacked with pain in the back and limbs, rigors, and sickness of stomach. At the date of admittance he was only partially conscious, being able with great difficulty to answer questions relating to his illness; the pupils were widely dilated; convergent strabismus of the right eye; face pallid; pulse quick and feeble; partial paralysis of motion with hyperæsthesia and muscular rigidity of the upper and lower extremities; head somewhat retracted, and superior spinal muscles rigid; he was dry cupped and blistered along the spine, and put upon mercury, rapidly administered, both by the mouth and by inunction; the head was shaved and blistered and subsequently dressed with mercurial ointment. On the night of the 4th he was attacked with tetanic symptoms, and on the following morning I found him unconscious; the head and neck retracted and fixed, and the upper and lower extremities rigidly flexed; he was incapable of answering questions, continually uttered the most piteous cries, and died in convulsions in the afternoon.

On post-mortem examination the arachnoid at the base of the brain was found opaque and thickened, especially in the *locus perforatus anticus and medius*, and in the floor of the fourth ventricle; some lymph was effused into the meshes of the *pia mater* in the circle of Willis, and along the course of the basilar artery; there was general vascularity of the brain, and some clear serum in the lateral ventricles; the spinal cord was removed in its entirety; the membranes were in a similar state of vascularity, and about the centre of the dorsal portion the spinal cord was softened, and of the consistence and colour of thick cream.

Case 3.—Eliza M'E., aged 9 years, a native of Blackrock, admitted into hospital September 15th, 1866. A month previous to this date she was exposed to cold by sitting for an hour upon a stone, and on returning home was attacked by rigors, sickness of stomach, and pyrexia; severe pains in the arms and legs set in soon afterwards; the child's mother regarded the attack as gastric fever, but took no medical advice till she brought the patient to the hospital a month subse-

quently; her condition was then as follows:—There was severe pain in the head; dilation of pupils; hot, dry, and rough skin; quick and feeble pulse; red and dry tongue; epigastric tenderness and irritability of stomach. On the following day (16th) she had a very severe rigor which lasted four hours, and during which the posterior cervical muscles were rigidly contracted and the head fixed; the arms and legs were flexed and immovable. On the 17th the tetanic symptoms had subsided, but the stomach continued to reject everything taken.

The treatment consisted in leeching, blistering, and mercury, at first in the form of grey, combined with antimonial powder, and subsequently the bichloride; the head was shaved and pustulated with tartar-emic ointment; the irritability of stomach was allayed by means of small doses of morphia in solution combined with liquor of bismuth, and a blister to the epigastrium, and the patient supported upon milk and lime-water in equal proportions for several days. After a month's residence in hospital, and a slow convalescence, the patient was discharged restored to perfect health.

There can be no doubt that in the past, and likewise in the current year there has been a predisposition to, and to some extent an epidemic visitation of, cerebro-spinal meningitis; some cases of this disease have been reported by Dr. Lyons in this journal, and in the course of the last session of the Pathological Society of Dublin that gentleman exhibited a very interesting morbid specimen illustrative of the pathological changes effected by it. If my memory serves me rightly these changes were nearly identical with those detailed in the report of my second and only fatal case. I believe the proper treatment consists in counter-irritation and rapid administration of mercury.

In the late Dr. Mayne's well-known article on the subject (*Dublin Journal*, August 1, 1846), the characteristic features of the epidemic visitation of that year are graphically sketched, as manifested in Belfast, Dublin, and Bray, the symptoms were sudden seizure with pain in abdomen, vomiting, often purging and collapse; reaction quickly followed, accompanied with retraction of the neck; rigidity of the spine and limbs; the surface was hot; pulse 120 and 140; stomach irritable, and pain in epigastrium; occasionally violent convulsions, or coma with constant moaning occurred, and ultimately complete coma with paralysis of sphincters and slow pulse; the mortality was very considerable, death taking place usually within a period from the commencement of the attack varying from forty-eight hours to four days. Pain in the head and strabismus were occasionally noticed; cutaneous sensibility was in some cases exalted; whilst in others it was blunted, and irregular or coloured respiration, in the absence of thoracic disease, was a notable though not a constant feature of the epidemic. The post-mortem appearances were opacity of the arachnoid at the base of the brain and in the spinal canal without exudation; engorgement of the vessels of the *pia mater*, and effusion of a greenish or yellowish lymph in the subarachnoid spaces and meeting the roots of the cerebral and spinal nerves; no unusual vascularity, induration, or softening of the brain or spinal cord, and no effusion into the ventricles. In some cases there was sero-purulent effusion into the *theca vertebralis*, and not at the base of the brain.

The subjects of the disease were usually boys under twelve years. I have given a summary of the epidemic of 1846, as described by Dr. Mayne, in order to fix attention upon the features by which the recent partial visitation has differed from it; of the three cases which I have given the patients were in two instances females; in two of these strabismus was manifested; and in the only fatal case effusion into the cerebral ventricles and softening of a portion of the spinal cord were discovered. In all other respects the symptoms and structural alterations were similar to those described by Dr. Mayne.

The beneficial action of mercury and counter-irritation is illustrated in the two successful cases, and finally, the danger of confounding this disease with gastric fever, owing

to the irritability of stomach, epigastric tenderness, and peculiar state of the tongue which are common to both, is exemplified in cases one and three, in which, it would seem, the mistake had been actually made at a time when the diagnosis was of vital consequence and well directed treatment most likely to be efficacious.

Proceedings of Societies.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, OCT. 3RD, 1866.

Dr. BARNES, President.

Mr. JAMES KEITH GROSJEAN was admitted a Fellow, and Professor Rizzoli, of Bologna, an Honorary Fellow, of the Society.

Mr. NEWTON exhibited three preserved specimens, which he presented to the Society.

Dr. BRAXTON HICKS showed a Cephalotribe of his own design. It was lighter in construction than any yet made, and possessed power equal to those of larger size now in use on the Continent.

The Report on Dr. Wynn Williams' case of "Cyst Removed from the Abdomen," and exhibited at the Society in June last, was read.

Dr. BRUNTON showed a Placenta which he had removed a few days before from a healthy primiparous young woman. It contained in its centre a round tumour about the size of a small egg. The specimen was referred to two Fellows for examination and a report upon the tumour.

Dr. SMUTS gave the history of a curious case of Prolapsed Placenta, in which, after the greater part of the placenta remaining outside the ulva for more than forty-eight hours, it retracted within the uterus beyond the reach of the finger, and was expelled immediately after the birth of a healthy living child.

Mr. MITCHELL read a paper on

A CASE OF EARLY AND ENTIRELY DETACHED PLACENTA IN LABOUR, PRODUCING INTERNAL AND CONCEALED HÆMORRHAGE, OF WHICH THE PATIENT DIED SOON AFTER DELIVERY.

The patient, who was in the ninth month of gestation, was early one morning awoke by a most unusually violent and protracted spasm in the abdomen, so severe that she became alarmed. This pain was followed by a discharge of blood from the vagina, which although not very great, continued more or less up to the time of the birth of a still-born child. She never rallied, and died shortly after delivery. A large, firm clot, the size of a child's head, had passed from the uterus just before death. Mr. Mitchell considered it as one of those very rare cases where the placenta was suddenly and, no doubt, entirely cast from the uterus by the violent spasm of that organ.

Mr. ROBERT DUNN gave the particulars of a

FATAL CASE OF CONCEALED ACCIDENTAL HÆMORRHAGE, OCCURRING AT THE EIGHTH MONTH.

Mrs. C—, suffering from a severe cold, experienced while in bed, after a violent fit of coughing, strange and unusual sensations about her womb, and became faint. From this she recovered, and remained well for three or four days, when Mr. Mitchell was sent for. On his seeing her, she was cold, exhausted, and faint, with a weak and feeble pulse. From this state she rallied, but was seized with labour a few hours later. The liquor amnii escaped early, and with it a large clot of blood. She became faint, and complained of the want of breath. The os uteri being dilated to only the size of a half-crown, and the pains inefficient, stimulants, beef-tea, and ergot were administered, and Dr. Robert Lee's opinion was sought for. The patient, however, rapidly got weaker, and expired before the consultation had concluded. The post-mortem inspection revealed a child of eight months lying in the normal position in the womb. The placenta was found to be completely detached and quite

loose, resting upon a large mass of coagulated blood, not less than a quart, in the fundus of the uterus.

Dr. GREENHALGH agreed with Messrs. Dunn and Mitchell that fatal accidental hæmorrhage was of rare occurrence, never having met with a case until within the last few weeks, when he was applied to by a teacher of midwifery to see Mrs. —, between thirty and forty years of age, the mother of many children, who had reached the end of the eighth month of her pregnancy. Dr. Greenhalgh found the patient blanched, cold, and almost pulseless, without the slightest evidence of uterine action. Stimulants and nourishment were given freely, but without signs of rallying. Eight ounces of blood were transfused, after which she expired. Although no time was lost in performing the Cæsarean section, a dead child was extracted. The circumference of the placenta was adherent, except about two inches of its upper part, through which a portion of clot was protruding. Nearly the whole of the centre of the placenta was detached, and between it and the uterus was a large coagulum, weighing from one and a half to two pounds. The uterus was remarkably blanched and flaccid.

Dr. BRUNTON stated that he had met with a similar case about the full period of gestation. His patient was collapsed and nearly pulseless, and in a state of intense suffering. There were no labour pains, but one continuous pain of an intense stretchy character. He found the os uteri dilated to the size of a florin, and the membranes tensely stretched, as during a labour pain; but there was no relaxation of them, as in the interval between true labour pains. There was no discharge of blood at all until the membranes were ruptured, and then an immense gush of bloody fluid came away, rapidly followed by the head and body of the child, and then came three large clots of blood, each as large as a child's head. The placenta was healthy and cup-shaped on the uterine surface, caused, doubtless, by pressure of retained blood. The patient recovered. Dr. Brunton maintained that the chief diagnostic symptoms of accidental concealed hæmorrhage were—1st, the sudden collapse and fainting, with continuance of this state; and 2ndly, the intense continuous stretching pain, and the tense state of the membranes, also continuous.

Dr. GRAILY HEWITT attached much importance to the presence of a painful feeling of stretching or dilatation in the abdomen as a sign of hæmorrhage within the uterus, but from facts which had fallen under his own notice, and which he mentioned, it was not a symptom which was invariably observed, and consequently could not be considered as reliable. It might be absent, and yet with the uterus possibly containing a large quantity of blood. Together with other signs, great prostration and pallidity of surface, the sensation alluded to had, however, much positive diagnostic value.

ON A NEW MODE OF TREATING EPITHELIAL CANCER OF THE CERVIX UTERI AND ITS CAVITY.

By C. H. F. ROUTH, M.D.

The author, after referring to the able papers of Mr. Moore on Cancer, said that the use of bromine as a local agent was first suggested to him by his colleague, Dr. Wynn Williams. Dr. Routh then related two cases admitted under his care at the Samaritan Hospital. In the first, the patient was thin, pale, and haggard, losing blood continually. There was a mass of fungoid epithelial growths, taking their origin from the os uteri, and about the size of an egg. The actual cautery was used to check the bleeding, and after the slough had come away a solution of bromine—five minims, to fifty of spirits of wine—was used. A piece of lint, the anterior surface of which was well saturated with the solution, was applied to the uterine diseased surface, and kept *in situ* by pledgets of lint. After forty-eight hours it was removed, and the part dressed at night with a poultice of lint dipped in warm water, and during the day warm douches were applied. In about a week a slough came away and left a large healthy granulating surface. Tannin with glycerine was applied, and used daily. The patient also took internally the iodide of arsenic with extract of conium. After a period of ten weeks she was fat, hearty, and well coloured; but as she occasionally lost a drop of blood, Dr. Routh carefully examined the internal surface of the uterus, and found about a quarter of its lining membrane affected with epithelioma. She left the hospital for some weeks, and on being readmitted a piece of wood about the size of the uterine cavity was prepared, and covered with cotton: the

upper part was dipped in a saturated solution of carbonate of soda, the lower in the bromine solution, and it was passed up and left within the uterus. Two or three further applications of bromine with glycerine were necessary, and the patient left the hospital with a moveable healthy uterus.

In the second case there was a large carcinomatous mass, about the size of an orange, attached to the os, which appeared to be large cauliflower excrescences, breaking down readily and bleeding at the slightest touch. On the 20th January the mass was removed by the wire écraseur, and a few days afterwards the spirituous solution of bromine was applied. She took internally the iodide of arsenic and conium, and was treated in the same manner as the first case. She left the hospital on April 2nd, with a movable uterus covered with healthy mucous membrane, and looking herself fat and hearty.

The author remarked that he was quite aware that two cases afford an insufficient criterion as to the value of any remedy, and that time had not been allowed to prove that the cures were lasting. Notwithstanding these objections, he thought, at the same time, there were some considerations which made an early publication of these cases desirable. The author concluded by drawing attention to the care necessary in mixing the bromine with the spirits, which should be done very gradually, to avoid an explosion. He hoped others would try the agent he now brought forward, and give the results of their experience. He believed it to be a potent and useful remedy, and likely to prove of service, if not in the cure absolutely, at least in the arrest of the progress of cancer.

Dr. WYNN WILLIAMS said that he had applied solutions of bromine, in varying degrees of strength, in cancerous growths, where there has been any breach of surface, for some nine or ten years; and for the last two or three years to this disease when attacking the uterus, with the effect of destroying the cancerous mass, and causing its removal by sloughing. The first patient on whom he used it was a man suffering from epithelial cancer which had commenced in the lower lip, the soft parts having been almost entirely removed; and wherever he was able to apply the solution of bromine the wound healed, until the whole external surface of it, extending, he might say, almost from ear to ear, had skinned over. The patient, however, ultimately died from extension of the disease to the neighbouring glands. Dr. Williams considered the beneficial effects of bromine were not confined to its corrosive or escharotic action only, but it acted also as a most powerful disinfectant, its good effects in this way being of great service. He had seen patients with that peculiar cachectic, emaciated aspect so common in those suffering from open cancer rapidly improve in appearance soon after using bromine applications. He had found that in almost every case in which he had been able to apply bromine directly to the cancerous growth it had been followed by most beneficial results. He had frequently prescribed bromide of iron internally whilst applying the bromine externally, but thought its effect very problematical.

Dr. ROGERS said he believed some of the previous speakers were labouring under an erroneous impression that the paper by Dr. Routh and the remarks of Dr. W. Williams tended to establish a new "specific for cancer." All that was desired to be made known was the fact that in some cases of epithelial cancer of the cervix uteri the bromine had proved a most energetic and valuable escharotic, destroying vascular growths, arresting hæmorrhage and the prostration resulting from it, and checking all fœtid and foul discharges. Healthy granulations followed its application, and the parts appeared free from disease. How long such improved state would continue could not at present be predicted. This was certain, that a most marked improvement took place locally and constitutionally. The patients would soon have died had not the disease been arrested; now they appeared restored to health and strength again. Of course, where the bromine could not be applied to the whole of the diseased parts the mischief could not be arrested, and the disease proceeded on its fatal course. Bromine, like other powerful caustics, required great care and all the precautions mentioned by the author in its use. From its not being properly guarded, he (Dr. Rogers) had known mischief to arise, which ought to have been prevented. He had used it himself, and had assisted the author with all his cases; and great credit was due to Dr. Routh for the skill, care, and perseverance exhibited by him.

Dr. ROUTH, in reply, said he had frequently seen cases of

extirpation of cancerous growths by the knife or éraseur, but they almost invariably recurred. The plan proposed did more, or supplemented what knives and éraseurs could not do; and he must say he never saw change so rapid from one of marked cachexia to robust health as under the bromine treatment. It was because he had thought this so remarkable that he wished others to try it also for themselves. If the agent was what he believed, the profession would soon acknowledge it. Herein he only followed the general rule of medical men, which differed so much from that of quacks, to make known at once any remedy for the good of all, and not to keep it secret. Great harm, he believed, had been done to the treatment of this affection in our schools and elsewhere by invariably speaking of cancer as incurable. Now he believed opinion was changing, and some began to believe a cure might be found. He did not say that bromine was certainly such a remedy, but at any rate it was the most powerful palliative he had met with. To see a woman dying by inches before you, and carrying about her an odour completing her misery, was a severe trial. If bromine could stop this only for six months it was surely to be received with thankfulness. Future experience, however, might prove its powers to be even greater than this.

ON THE MECHANISM AND MANAGEMENT OF DELIVERY IN CASES OF DOUBLE MONSTROSITY.

By W. S. PLAYFAIR, M.D., M.R.C.P.

The author pointed out that, although numerous instances of double monstrosity were recorded in various publications, and specimens were met with in all our museums, little reference was made to the mechanism of delivery in any of our standard works on Obstetrics. As the cases were likely to give rise to very formidable difficulties in practice, the object of the paper was to arrive at a clear understanding as to the means by which Nature attempted delivery, with the view of arriving at some definite conclusions as to the proper management of cases of the kind. Details were collected from various sources of thirty-one cases, in which the labour was more or less accurately described. These histories were analyzed under their respective classes, and practical deductions were arrived at as to the proper course to be pursued with the view of rendering the most efficient assistance.

Reviews.

THE PHYSIOLOGICAL ANATOMY AND PHYSIOLOGY OF MAN. By ROBERT B. TODD, WILLIAM BOWMAN, and LIONEL S. BEALE, Fellows of the Royal Society, former and present Professors of Physiology and of General and Morbid Anatomy in King's College, London. A New Edition, by the last-named author. Part I. London: Longmans. 1866.

TODD and Bowman's Physiology is now almost a thing of the past, so rapid are the changes exhibited by the ever shifting scenes of physiological and histological science, but the book will always be welcome in consequence of the known ability of its writers, and the original views which it has unfolded. Of the two first-named authors one is removed from the sphere of his earthly labours, and the other has abandoned the sphere of abstract science for more practical pursuits, and the preparation of the new edition has therefore fallen to Dr. Lionel Beale, the present accomplished Professor of Physiology in King's College, who assisted in the composition of the concluding part of the former work. To those who know Dr. Beale's zeal for physiological science, and are acquainted with his multitudinous labours in that department, it is only necessary to mention his name as a guarantee for the excellence of the present edition, which will of course be brought up to the standard of the present day. The part now published consists of the Introduction, the First Chapter, on structure, and the Second Chapter, on chemical composition, and it is said to be complete in itself; but it is to be hoped that the succeeding parts will be regularly supplied, as the value of such a book to students, for whom it is especially

intended, mainly depends upon its being brought out at stated intervals, and upon its being completed within such a period as may prevent one part from being at discord with another, owing to the development of new theories, or the progress of discovery.

ON INHALATION, AS A MEANS OF LOCAL TREATMENT OF THE ORGANS OF RESPIRATION, BY ATOMIZED FLUIDS AND GASES. By HERMANN BEIGEL, M.D., Assistant-Physician to the Metropolitan Free Hospital. Pp. 200. London: Hardwicke. 1866.

THE object of this work is to show the efficacy of the inhalation of atomized fluids in several diseases of the respiratory tract. Dr. Beigel does not assert that in such cases success will always follow the process he recommends, but he desires to prove that a cure can be often effected by this method, which, in suitable subjects, he regards as preferable to all other kinds of treatment. The book is divided into two parts, the first of which is devoted to the subject of inhalation in general, the history of the invention, the description of the instruments employed in the treatment, the medicines used for the purpose, and the effects they produce; and the second part is on inhalation applied to special diseases. Among these are diseases of the larynx and trachea, as laryngeal hyperæsthesia, œdema glottidis, laryngitis, croup, and diphtheria, and diseases of the bronchi and lungs, as bronchitis, asthma, emphysema, hæmoptysis, phthisis, gangrene of the lungs, and hooping-cough. The historical part contains a very able summary of the successive steps by which the process of the inhalation of atomized fluids has become established as a therapeutical agent, and some very good plates are given illustrative of the apparatus employed and the methods of using it. The second part contains the details of a number of cases in which the process of inhalation has been successfully employed. Dr. Beigel writes like a scholar, and his English displays but few foreign idioms; and the book is very well got up, the paper, the type, and the illustrations being alike good.

MEDICAL DIAGNOSIS, WITH SPECIAL REFERENCE TO PRACTICAL MEDICINE. A Guide to the Knowledge and Discrimination of Diseases. By J. M. DA COSTA, M.D. Second Edition. Revised. Philadelphia: J. B. Lippincott and Co. 1866. Pp. 784. 8vo.

IN THE MEDICAL PRESS for the 1st November, 1865, we inserted a review of the first edition of this work (which had made its appearance in 1864), particularly noting in it a defect common to all works of its class—an attempt at the complete isolation of diseases, and, in too many instances, an undue dependence on merely physical diagnosis. Further, the attention of the reader was called to another want—the little notice taken by Dr. Da Costa of the complications of diseases, and of the co-existence of various morbid states in the same or in different organs.

Despite of these and other defects, this work has gone through a second edition in a very short time, and it now comes before us with the addition of ninety pages of new matter, and twenty-two wood-cuts "mainly on subjects which in the former edition were briefly touched upon." New matter has been largely incorporated in various parts of the work; but the chief additions will be found in the Chapters on Diseases of the Brain, of the Larynx, of the Blood, on the Urine, and on Parasites, and in the Section on Abdominal Enlargement.

Medical subjects of more recent interest are adverted to and explained; for example, pp. 153-159 are occupied with an account of Laryngoscopes and Laryngoscopy, and wood-cuts are given in illustration of the letter-press. Again, on page 39, we find an account of the Sphygmograph, and an illustrative wood-cut. On page 44 we have a wood-cut of a

Thermometer for clinical use, with remarks on its application to the diagnosis of disease. This part of the new edition we consider far too meager, and not at all in proportion to the importance of the subject. Further, the *Æsthiometer* is figured, and its use explained on pp. 56-58. On the whole, we consider that there is a great improvement in this second edition, although we do not think any possible addition or alteration can obviate defects which are necessarily connected with a book of this kind. Everything of value in it can be, or ought to be, found in our standard books on the theory and practice of physic; and the advanced student or junior practitioner who is obliged to resort to a work on medical diagnosis for the discrimination of most of the diseases here treated of, must be much in the same position as the physician who closely adheres to prescriptions taken from "Pareira's *Selecta e Prescriptis*," or the parson who always preaches another man's sermons instead of his own. The meagerness of many of the portions of this second edition cannot fail to strike the reader. On p. 125 we find mention of tetanus, and the entire of Dr. Da Costa's observations on it are comprised in about three and a half pages; on the other hand, an entire section—pages 289-357—is very properly devoted to diseases of the heart. Equally extended, in proportion to other parts of the work, is Chapter XI., on Fevers, Dr. Da Costa's observations on this most important subject comprising no less than sixty-seven pages.

Chapter XII., on Diseases of the Skin, is very scanty. Here, as every practical man knows, diagnosis is frequently difficult, always important, and the varieties are legion. Yet, only about twelve and a half pages are devoted to this very important division. The Diagnosis of Poisons, in Chapter XIII., is still more scanty, and moreover almost useless. No one who wants to know anything about poisons will neglect to consult some work on that subject, or on medical jurisprudence, in preference to a book of the kind now under notice. The concluding portion of the book is enriched with woodcuts of various parasites; for example, the *Trichina* in recent human muscle, the *Trichina Spiralis*, and others. To sum up: we are of opinion that this edition is a considerable improvement on its predecessor; and to readers who will bear in mind the defects necessarily inherent in a work on Medical Diagnosis, we can commend Dr. Da Costa's work. Its style is simple and unpretentious, and its English will bear critical examination. We know of no better book in our language on Medical Diagnosis.

London Medical Press & Circular.

"*SALUS POPULI SUPREMA LEX.*"

WEDNESDAY, OCTOBER 31, 1866.

A TALE OF SCANDAL AT THE MIDDLESEX HOSPITAL.

THE Managers and Medical Officers of our Hospitals, Asylums, and Dispensaries are often placed in very difficult positions when dealing with offences, real or alleged, occurring in the institutions placed under their superintendence. It is not to be supposed, while human nature remains as it is, that scandals will not arise in establishments where a large number of persons, male and female, are collected together, or that faults, errors, and crimes, common enough in the outer world, will be entirely absent within the walls of buildings devoted to

the reception of the sick and the infirm. All that can be expected is, that when charges of misconduct are made against the officials of such institutions, they should be promptly made the subjects of careful investigation, and the offenders punished if the charges are proved. But the question then arises as to the course which ought to be pursued when charges are made which are found to be groundless, but which, nevertheless, by the mere fact that they are deliberately preferred and persisted in, are injurious to the character and reputation of a Medical charity.

The Committee and the Medical Officers of the Middlesex Hospital have lately been placed in a dilemma similar to that we have just alluded to, and the consequence has been a trial at the Central Criminal Court. We may at once state that, notwithstanding the results of the trial, the authorities of the Hospital are free from suspicion, and the course they have pursued is even creditable to their management of the officials under their control.

It appears that during the month of July, in the present year, a patient in one of the wards of the Hospital made a complaint to Mr. SHAW, the Senior Surgeon, of some impropriety of conduct which was alleged to have taken place in the ward one night between another patient and one of the female nurses, and which the informant declared he had witnessed. The accusation was exceedingly improbable on the face of it, for independently of the unblemished moral character of the nurse impeached, the patient who was charged with this act of immorality was proved to be suffering at the time from a severe and painful injury to the knee, received at the famous charge of Balaclava, and subsequently aggravated by a kick from a horse, and which injury necessitated the patient's absolute rest and the confinement of the knee in bandages and a cradle. The charge of immorality, however, having been made, and duly reduced to writing and signed by the informant, was very properly investigated by the House Committee, who decided that it was groundless, and they retained the nurse in her situation.

If matters had rested here the public would have heard nothing of the story, but the authorities determined to prosecute the person who made the accusation, and after a preliminary examination before a magistrate, he was put on his trial at the Central Criminal Court for libel. After a long investigation, the jury came to a decision which, although affirming the publication of the libel on the part of the prisoner, was tantamount to a verdict of acquittal; for they held that although the charges were false, yet that the prisoner when he made them believed them to be true; and, moreover, that he had not published them except to the authorities of the Hospital, and for the purpose of procuring an investigation. The jury, in fact, held that the statement made was what is technically called a "privileged communication."

We should remark that the counsel for the prisoner

endeavoured, though in very bad taste and without doing any good to his client, to cast reflections on the management of the Hospital, by referring to alleged irregularities on other occasions. For so doing he was very properly rebuked by the judge, who observed that not only were his insinuations entirely destitute of foundation, but the circumstances alluded to had no connection with the case.

The only question which arises on a view of the facts is, whether the authorities of the Hospital were justified in instituting a prosecution, or whether the better plan would not have been to let the matter drop after it had undergone a thorough and impartial investigation. We think, however, that they may have considered themselves justified in taking the course they did, because, had they acted otherwise, it might have been whispered about that they were bolstering up the misconduct of their servants, and that, after all, the accusation might be true. They therefore boldly came forward and subjected themselves and the whole management of the Hospital to a thorough scrutiny, and although the prisoner was acquitted on the grounds we have mentioned, and the officers of the Hospital are now liable to a civil action, yet there cannot be any doubt that the character of the institution has been vindicated, notwithstanding the unjust and unfounded aspersions cast upon it by the prisoner's counsel, in the exercise of that forensic liberty which too often runs into licentiousness, and is too rarely checked by the Bench.

THE SCHOOL OF PHYSIC IN IRELAND.

Of the many institutions connected with our profession none is of greater importance at present than the Corporation or College called "the School of Physic in Ireland." We therefore propose to make some practical observations regarding it, because a large number of the best class of our students are deeply concerned in its good management, and also because there is a great want of information regarding its constitution and government, as well as respecting its general management.

We purpose, then, to give a short historical account of the origin of, and legislative enactments about, this Corporation; and to follow this up by giving our views regarding the professional and clinical arrangements of the school, as it is at present constituted. We may state generally that any facts here quoted are given on what is considered to be a good authority in such matters.*

In the time of KING CHARLES I. the state of physick in Ireland was deplorable in the extreme. To remedy this the King issued his letter promising a Charter to a College of Physicians; but owing to the troublous state of the times the Royal intention was not

carried into effect. Towards the close of the Cromwellian period, Dr. STEARNE, then a Senior Fellow of Trinity College, Dublin, and Regius Professor of Physic there, founded in Dublin a Medical College, long after known as Trinity Hall. On the restoration of the Monarchy this foundation was confirmed, and before the death of STEARNE it became developed by Charter of CHARLES II. into "the College of Physicians in Dublin." Of this College STEARNE was President for life, and we have ample evidence that medical education, such as it then was, and particularly practical anatomy, was studied there with an ardour which many difficulties did not suffice to overcome.

Among the successors of Dr. STEARNE in the presidential chair was Dr. DUN, afterwards Sir PATRICK. In his time Trinity Hall was abandoned; a new Charter was obtained for what is now termed "The King and Queen's College of Physicians in Ireland" (because it was granted by WILLIAM and MARY); and that medical education was at a low ebb is evident from his bequeathing, by his celebrated will and deed, his property to endow one or two Professors in the College of Physicians in Dublin. At first only one Professor was chosen; and owing to lengthened Chancery litigation between him and Lady DUN, who survived her husband, nothing useful came of Sir PATRICK's intentions for many years. Several Acts of Parliament were passed respecting DUN's will and DUN's Professor or Professors during the eighteenth century. The chief effect of these was to increase the number of Professors on his foundation, so as to make between them and the University of Dublin Professors a complete staff, capable of giving a full medical education to students, who otherwise should resort to foreign schools for professional instruction.

As medical ideas progressed, it was found that clinical lectures were necessary, and it was proposed to devote part of the proceeds of DUN's estates, which had now become valuable, to establish and maintain an hospital for this purpose. Owing to some flaws in the Acts of Parliament already referred to, the Professors were enabled to protest successfully against this project for some time; but at length, in the year 1800, the Irish Parliament passed the Statute ever since known as the School of Physic Act. By this Act the School of Physic consists of the Professors of Practice of Medicine, Institutes of Medicine, and *Materia Medica* and Pharmacy, on the foundation of Sir P. DUN; of the University Professors of Anatomy and Chirurgery, Chemistry, and Botany; and of such Students (who need not necessarily be Students in Arts) as shall have matriculated with the Registrar of Trinity College, Dublin.

An hospital, to be called Sir PATRICK DUN's, was directed to be founded and supported for the clinical instruction of these students out of DUN's estates, which were to be, for the most part, appropriated to this purpose; and which, with the exception of salaries of small amount to be paid to DUN's Professors, to his librarian, and to defray other minor fixed charges, were directed to be

* Records of the King and Queen's College of Physicians in Ireland; including a Memoir of Sir Patrick Dun, a Memoir of Dr. Stearne, the Register of the College for 1866, the two Charters, and other important Documents concerning the Profession of Physic in Ireland. Compiled by T. W. Belcher, M.D. Dublin, &c., Fellow and Censor, &c., of the College. Dublin, 8vo, Hodges, Smith and Co. 1866.

totally diverted from the object intended by him to the support of an hospital which he never contemplated. The Professors before mentioned were appointed Clinical Teachers in this hospital, and its internal management was committed to a Board consisting of the Visitors and chief Officers of the College of Physicians, and the Provost of Trinity College, all for the time being; and twelve other persons to be elected by the *ex-officio* Governors from among the subscribers to the building and maintenance of the Hospital. The Professors on DUN's foundation were to be governed by the College of Physicians, which were to be practically their electors, while the University Professors were to be appointed and governed by the Board of Trinity College, which also supported them, as far as their fixed salaries were concerned. The last provision of the Act respecting Sir P. DUN's Hospital came into operation in 1814, when it was opened for the reception of patients and for clinical instruction. Since then all candidates for the degree of M.B. in the University of Dublin have been required to attend its clinique, and, until recently, to put in three-fourths of their anni medici in the School of Physic. About twelve months ago surgical cases were for the first time treated in the Hospital, which is now a recognised medico-surgical institution. We hope to pursue this subject in our next.

THE M.D. HONORIS CAUSA OF THE QUEEN'S UNIVERSITY.

THE queries which we lately administered have received a silent consent. It is true that Professor GREENE of Cork has received the M.D. Honoris Causa from the Senate of the Queen's University, not having the remotest pretension to a knowledge of medicine. The explanation offered is as follows:—When the late Dr. HARVEY was candidate for the Chair of Botany in the University it came out that he had not the essential M.D., nor the information to get it. The Board of Trinity College, determined that he should be the Professor, gave him the M.D. Honoris Causa. This gave rise to much complaint on the part of the other candidates, who naturally regarded it as a declaration in favour of Dr. HARVEY. It was then determined that the mistake should not be repeated. The Senate of the Queen's University have, however, followed the mischievous precedent, and under much more inopportune circumstances. Now-a-days a degree Honoris Causa is something more than a title, for it confers on the holder a right to practise and to be recognized as an educated medical man—to give evidence on medical subjects in courts of law, and to hold medical appointments. Accepting Professor GREENE's guarantee not to practise, we have no reason to know that he may not be called upon to appear as a witness, with or against his will, to give evidence on matters of which he is confessedly ignorant, or that he may not think himself justified in accepting some appointment requiring medical knowledge, or

hitherto occupied by a *bona fide* member of our profession. The General Medical Council should look to the establishment of such a precedent, and should finally put a *veto* on its repetition.

CHOLERA.

IN the forty-second week of the year ending Saturday, October 22, of which the Registrar-General's returns appeared simultaneously with our last number, we have to chronicle a diminished number of deaths from the epidemic. The total number of deaths registered in London during the week was 1464, being an excess of 237 over the average number, corrected for increase of population. The deaths from cholera were 144, from diarrhœa 55, making a total from these two forms of disease of 199, a number which does not equal the excess in the mortality. This excess is, however, partially accounted for by an increase in the number of deaths from bronchitis—the first intimation that winter has already commenced, and that the diseases of that season will now for some months present themselves prominently in the weekly returns. The deaths from cholera and diarrhœa for the last seven weeks have been respectively 289, 292, 248, 244, 251, 254, and, as stated above, last week 199. On Sunday and Monday, the 21st and 22nd, 20 deaths from cholera and 4 from diarrhœa were registered in the metropolitan districts. On Tuesday there were 19 deaths from cholera, and 7 from diarrhœa. On Wednesday, the figures fell to 12 and 6 respectively; and on Thursday they were 12 and 8.

The deaths have continued to be distributed over the whole metropolitan area. The annual rate of mortality during the week was 25 per 1000 in London; 30 in Edinburgh, and 45 in Dublin.

LIVERPOOL.

Here the epidemic continues to decline. The deaths, during the last three weeks, have been, respectively, 99, 53, and 38. There is yet, therefore, a hope that the disease may this time be held in check by vigorous sanitary measures.

THE TYNE.

Last week we reported an outbreak at North and South Shields, and other Tyneside towns. We regret to announce an increase of cases. Several deaths have been reported also at Newcastle, and at Sunderland-on-Wear. Up to the 25th, we were informed that 60 deaths had been recorded at North Shields, and that diarrhœa was very prevalent. There appears reason to believe that contaminated water will once more be found to be the cause of the outbreak. Numerous cases occur in a circumscribed district. Coble Dene is the centre of the plague, while parts that suffered most in previous epidemics altogether escape. It would appear that this part is more or less supplied by a well, below the level of a mine, whence the filth of men and animals could easily percolate; moreover, some surface-draining is admitted to the reservoir. The parts supplied by the main source of the North Shields Water Company are escaping. It falls then upon this company to say why they should derive any part of their supply from the doubtful well to which we have alluded. At South Shields, the public health is in a far better condition, although, being situated on the lower side of the river, it might have been conjectured that the opposite condition would obtain. South Shields fortunately possesses a fine supply of water, derived from the magnesian limestone strata of the county of Durham.

EDINBURGH.

Up to the 22nd inst., 39 cases had been admitted to the Cholera Hospital since the opening of that institution on the 9th. Of these 27 had terminated fatally, and 7 recoveries were reported. A good deal of diarrhœa prevailed all over the city, some of the best situated districts suffering as much as those in less favourable sanitary condition.

DUBLIN.

We regret to announce a serious increase in the epidemic in the Irish capital. The deaths, which had been in the two previous weeks 81 and 98, last week rose to 118, and it has been asserted that other deaths have taken place and not been registered. There can be no doubt that much requires to be done in the way of sanitary improvement. What are the Town Council about that they do not commence by cleansing the Liffey, instituting house-to-house visitation, engaging an army of scavengers, carrying lime-wash into the dirty dwellings of the poor, and securing the services of a good number of medical officers?

THE CONTINENT.

GERMANY.—Up to the 22nd instant, 8139 cases had been reported in Berlin, of which 5330 ended fatally. It is asserted that at present only about six new cases occur daily, of which, on the average, three die. Some official returns have been published in Vienna, from which it would appear that upwards of 200,000 persons have been attacked by the epidemic in the empire of Austria since the commencement of July. The deaths on the average were about 50 per cent. In Vienna alone there have been 3242 deaths. In Hungary the attacks have been more than 49,000 in number; the deaths 21,556. In Moravia 27,624 had died out of 67,192 persons attacked. The pestilence throughout Germany is now declining rapidly.

FRANCE AND ITALY.—The obstinate resistance of the French authorities to the publication of statistics renders it impossible to estimate the exact truth. We learn from private sources that the epidemic still shows itself along the Mediterranean coast. In Southern Italy and Sicily though the cases are not numerous, they occur in new districts, and many towns of the kingdom have had a few cases. We have heard of several deaths at Rome, and a few cases at Florence.

Notes on Current Topics.

CRUELTY TO LUNATICS.

DURING the week two warders of the Surrey County Asylum have been charged at the Central Criminal Court by the visiting justices with "unlawfully striking, wounding, and ill-treating" one of the patients. We have no intention of analyzing the evidence on this occasion. Both men were found guilty, but the jury recommended them to mercy, in consideration of their position being one in which they might be tempted by the violence of the lunatic to strike a blow.

The Recorder, taking into consideration this recommendation, sentenced them to two months' imprisonment with hard labour. It cannot be too widely known that the law is ample to protect the insane from violence and ill-usage. The humane system, thanks to the untiring

perseverance of medical men, is now completely established. A keeper guilty of cruelty must expect severe punishment, and happily there is no want of disposition on the part of the authorities to enforce the law.

This case, however, affords us the opportunity to point out that strong men, and warders need be strong, selected from the class whence most of them are taken, are under great temptation in cases of violent lunatics to employ their strength too readily. They have not the same faith in, nor the ability to carry out, a mental control, as better educated men. For this reason we would gladly see the medical element increased. Were half a dozen young medical men added for a while to each of our asylums, while greatly benefiting the institutions by infusing a higher tone in the attendants, they would acquire for themselves so much valuable experience and information that, we doubt not, many as soon as they have passed their examinations would gladly become clinical assistants for a few months, without salary. The plan has, we believe, been partially tried at Bethlem, but on a very small scale. If it were difficult to obtain qualified practitioners, which indeed we can scarcely imagine, advanced students might be admitted. This is the way to diffuse the best knowledge of mental diseases throughout the profession, and the presence of a few such gentlemen would, we feel sure, strengthen the hands of the resident physician in protecting the patients under his care.

THE LONDON MEDICAL SOCIETIES.

CONCURRENTLY with the new life infused into the profession by the opening of the winter session at the schools, the Medical Societies have commenced their periodical meetings. From what we hear, a number of capital papers will be brought forward, and the session will prove by no means a barren one. Nevertheless, there is evidently a want of new blood in more than one. New members ought to be obtained, and some of these should become office-bearers. Each society should be a nucleus of work in its department, and thus a great deal of progress ought to be made. When we compare the results of our societies with those of similar continental institutions, we confess that we are not altogether satisfied. The MEDICAL PRESS AND CIRCULAR has always given cordial support to the societies, and will continue to do so. Let the latter, however, remember that brief papers, eliciting good discussions, are of the utmost importance. Discussions are in fact the life of societies. For elaborate essays the printing press is the more natural medium. We cordially wish a brilliant session to all our societies.

A LATE APPOINTMENT IN THE ARMY.

A CORRESPONDENT draws our attention to the fact that an individual who was formerly an assistant-surgeon in the army, but who was lately a witness on the trial of one Hunter, and professionally attended some of that person's patients, has been again admitted to the service. We beg to endorse our correspondent's inquiry as to whether this appointment meets with the concurrence of the Director-General? Further, we should like to know whether, before reaching the eminence from which he may serenely look down on such small things, this official would have liked to have had thrust upon him, as a brother officer, a practitioner who had in any manner, direct or indirect, been associated with Hunter or his advertisements?

NEW INVENTIONS.

At such a time as the present, when epidemic cholera warns us to adopt additional precautionary measures against the propagation and spread of disease, it becomes our duty, both collectively and individually, to guard against its direful incursions: we therefore observe with satisfaction an invention calculated to faithfully guard the threshold of our dwellings against the intrusions of an important contamination in an alimentary substance—the water we drink. Although not our

pany, between the entrance of Somerset House and King's College, in the Strand. In addition to this, it also embodies the necessary requirements to ensure its constant action and easy application to existing circumstances.

The accompanying diagram will serve to illustrate the mode of application better than we could afford space to describe; suffice it to say, that the system is easily applicable to any existing house-cistern, at a moderate expenditure, and thenceforth, from the period of its adoption, every drop of water drawn from that cistern is necessarily purified from organic matter on the moment previous to usage; thus, again, any fresh taint or vapidity, liable to generate by the accumulation of filtered water, is here avoided.

Other systems of filtration may prove efficient in their action, as experience teaches us; but the inconvenience

intention to recommend any particular form of apparatus or description of article for so important an object, at the same time, in the use and application of one substance there can arise but little controversy. Such is animal charcoal. The remarkable properties of this substance, as an oxidizer, are foreign to nearly every other known body: or, if present, are practically useless. Based, then, on this, a sure foundation seems to be the cistern filter manufactured by the Water Purifying Com-

experienced in the slow progress made by them in the operation of purification, be it even one pint of water, much more in replenishing the culinary utensils with water for consumption, necessarily precludes their general adoption. But still more, many do positive harm in arresting any suspended organic matter the water might contain, and by exposing such to the continued passage of the subsequent water passed through, offers every opportunity for its ultimate re-solution. Such may render the water bright, nay, more sparkling, by the generation of carbonic acid, arising from the excess of organic matter, but, it is needless to add, is prejudicial to health. These objections seem to be entirely overcome in the filter alluded to, and we can only add, from practical experience, that we have found those facts fully borne out in practice.

Correspondence.

ON THE PRESENT SYSTEM
OF
MEDICAL EDUCATION AND EXAMINATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the hope that some of the gentlemen to whom has been confided the pleasing task of introducing to their studies new students of medicine, would have proposed the adoption of a better mode of medical examination and education than that at present in existence, I have deferred laying my views on the question before the profession. Now that the introductory lectures have been delivered, and that by their silence on this subject the lecturers seem to have tacitly acknowledged the present system to be incapable of improvement, I would be backward in what I consider my duty to the profession were I not to show up the evils which beset the system, and to propose such means as I think would remedy the defects.

No more fitting opportunity could have been found than that which so many gentlemen had within their reach during the past few days of proposing innovations in medical education and examination.

Why did not those gentlemen avail themselves of the opportunity? Was it that they considered the system perfect, incapable of improvement? Was it that they saw the inutilty of proposing any change, lest their words should be but wasted breath? Was it that they feared to speak out their minds, lest by so doing they should bring down on them the odium of the boards to whom is entrusted the management of education and examination?

I, for one, deny the perfection of the system, and I am fearless of the censure of any individual or of any community.

It may be that the propositions which I am about to make will be disregarded—that the views which I shall express will not be entertained—and that even the truths which I shall mention will be denied. It will be said—"Who is this that would teach us how to teach, and how to test knowledge?" He is one who has thought on the subject, who has suffered from the evils of it, and who will at least expose those evils, show how they may be remedied, and who confides the agitation for the adoption of the remedies to honest-minded men—men who are lovers of their profession, who are zealous of its advancement, who would have it a profession to which to belong would be a matter of pride, and a life-long boast—men who, educated themselves, would have for their co-labourers well-educated, skilful, and competent persons.

I have thought best to consider the subject under three heads, viz:—

1. Preliminary Education.
2. Professional Education.
3. Professional Examination.

Without further preface we will proceed to consider what is, and what ought to be,

PRELIMINARY EDUCATION.

By the term "Preliminary Education" I mean such education as is imparted before entering on college courses, in schools, and by private teachers. English in all its branches, Latin, Greek, and French Literature, and Mathematics, form the usual school curriculum. I have nothing to say against this; it is necessary for a gentleman to be acquainted with the literature of his own country, to study man's divisions of the globe: a knowledge of Greek and Latin is desirable, but, in good truth, I cannot see any great advantages accruing from school education in the dead languages to pupils who are not intended for one of the learned professions, more especially as all this knowledge is in after-life forgotten. Mathematics is, of course, a necessary study.

But has the schoolboy so much to learn that the introduction of the natural and experimental sciences into the list of his studies would be impossible? Are the sciences of so little value, practically, that to study them would be time lost? Nay, no occupation in life, be it ever so humble, ever so low, there is none in which a knowledge of science will not be of incalculable use. Alas! the old idea, which has left our ancient universities, until lately, mere repositories of the literature of bygone days, has not yet been eradicated from our schools. Crush it out, and at once. Look at the achievements of science! The world begirt with a wire—the carrier of our thoughts—the carriage of the thought as rapid as thought itself! Time defied! Distance outdone! Consider what science may yet achieve. No one can, with justice, say that science is not necessary for everyone, at least as necessary as an acquaintance with Latin and Greek.

Now, you will ask what advantage would accrue from school education in science to the intending student of medicine? Those subjects are presented to him which will form the studies of his college days. From his school experience of them he will be able to form an idea as to his aptness for the more intricate study of them hereafter, and thus he can judge also whether he is fitted for a profession which is based on those sciences, for many students enrol themselves as candidates for the medical profession thinking it of easy attainment. Moreover if, after school study of the sciences, he should still wish to enter on the arduous studies of that profession, he would not step for the first time on the threshold of his college ignorant of the very rudiments, of the very alphabet of science, but anticipating the difficulties which attend the study of it, and having overcome many of the more abstruse problems, *he would know how to prosecute his studies profitably.* Such are a few of the advantages of school education in science. I will conclude this part of my subject by proposing as the proper sciences for school teaching the following:—

Natural Philosophy,
Botany and Zoology,
Physiology, and
Chemistry.

PROFESSIONAL EDUCATION.

Under this heading I will first consider whether the universal system of imparting information by lectures is admissible. This method of teaching may have been very well for the students of bygone days, when they commenced their professional education at a more mature age than they do at present. They now enter college mere *boys*, fresh from school. Surely you will not deny that it is exceedingly pernicious to entrust to those young school-boys their own education at college. They come into a lecture-room, and while the professor is expounding the mysteries of science in eloquent terms, the great majority of the students are busily engaged in transmitting their names to posterity by the simple process of carving them on the seats in their immediate neighbourhood. If after lecture you ask, say twenty of them, the bare subject of the discourse, the great probability is that one of the twenty will give a correct answer.

Very few of those young students spend their evenings in study; they say to themselves, "time enough." Time enough! when you are expected to learn well about twenty abstruse and difficult sciences in four years! *Four* years, did I say; should I not rather say *two* years? for does not an *amicus medicus* consist of only six months? Very few students devote their vacations to study. Hence you have twenty-four months to study twenty sciences! Not five weeks to learn a science!

Young fellows fresh from school, no matter how anxious to learn, cannot do so profitably under the present system. It is useless to tell them to take notes of lectures—they cannot do so. While taking down a point which strikes them as important, they lose, perhaps, far more useful, practical, and important parts of the lecture, and the result is, a jumbled idea of the lecture, which is more pernicious than a total ignorance of it. It is useless to tell them to follow their lectures in their text-book; the lectures seldom or never agree with text-books, either in style, matter, or mode of arrangement. How much more judicious it would be to establish *examination classes* in lieu of those lectures! If each professor were to adopt a class-book, and to mark out certain portions of that book to be read by the student in

the evenings, and to be examined on by him the next lecture day, what advantages would accrue? If the student showed evident signs of not having studied his task, I would institute a fine, or some punishment which would ensure study on the part of the student. After the examination the professor might indulge in any remarks on the subject which he considered necessary, in order that the students might entertain no false impressions. Now, would not this system be pregnant with advantages to the students and to the profession? The students would be obliged to study, and could not fail to receive lasting impressions of their studies. They would, moreover, get into the habit of expressing their ideas in good and explanatory language; and lastly, that abominable system of "grinding," to which so many students now resort, and which is the curse of the profession, would be done away with. I have yet a few other suggestions to make before I leave this subject. I would advise that each professor should give out to his class a portion of study to be worked up during the vacations; that he should hold examinations in those subjects on the coming back of the students, and that to those students who do not show that they have profitably studied during the vacations, the certificate of attendance on the course be not given. I have now to speak of instruction in the dissecting-room. I would divide the students here into different classes, according to the parts under dissection. I would hold weekly examinations of each class, making each student demonstrate before the class a particular part; thus the student would be compelled to dissect properly, and to study the parts as he comes to them, and thus, also, he would gain confidence in his anatomical knowledge, which would be of use to him all the days of his life. The majority of students use the dissecting-room as a smoking club or a gossiping resort. Dissecting, as at present practised, is merely a cutting up of the subject without any study.

Now, about hospital attendance. I would insist on a total revolution of the present system. I would not have my students a set of "perambulating machines." I would adopt "compulsory clerkships." Each student should have a few cases on which to report, &c. On lecture days I would compare the reports on similar cases, and make such remarks as I should think explanatory and useful. Lastly, I would deliver my clinical lectures at the bedside.

I come now to consider

PROFESSIONAL EXAMINATIONS.

What is the meaning of rejecting a candidate on *all* subjects if he has passed in *any*? Why should he be referred back to those subjects which the examiners have passed him in? Would it not be possible and advisable to institute individual or separate examinations, examinations on individual subjects, to be passed by the student at such a time as he thinks himself prepared?

When a student has many subjects to prepare at the same time he rarely will study any of them perfectly. The proverb concerning multiplicity of irons in the fire is as applicable to a medical student as it is to any other individual. Again, I would ask is it possible to judge of a student's knowledge of a subject by asking him a dozen (sometimes six) questions thereon? Lastly, I put it to you whether it is fair to judge of a student's knowledge by *viva voce* examination? I think that every one of an honest unbiassed mind will agree with me—1st, in proposing the rejection of a student only on those subjects which he has failed to satisfy his examiners in; 2ndly, in advocating the adoption of individual examinations; 3rdly, in proposing to give a greater number of questions; and, lastly, in insisting that *viva voce* examinations be used only to ascertain the *practical* knowledge of the candidate, as in an anatomical demonstration, a chemical analysis, diagnostic examinations of patients, &c. I have yet one other proposition to make—viz., the establishment of national examining boards. Let there be in England, in Scotland, and in Ireland a separate examining board for granting Medical and Surgical Degrees. Let this board be open to all students. It would be a bold thing to propose the abolishment of the separate examining bodies now in force, and yet what a vast amount of good would result from such a measure. No more petty rivalry, no more jealousies or bickerings—a united profession, a cemented brotherhood.

I have done now; and I confess that I entertain but little hope that my voice will be heard. Still, I have the consolation of knowing that I have performed a duty which was

imposed on me, inasmuch as there was not to be found another who would advocate the good cause. I have worked for the good of science, consequently for the welfare of mankind, and therefore for the honour of God.—I am, Sir, yours faithfully,
M. I., M.Ch.

NOTE UPON COMMERCIAL CARBOLIC ACID FOR DISINFECTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Crude or liquid carbolic acid is a definite hydrate having a certain composition. It may be considered practically to be as good an antiseptic as pure and crystalline carbolic acid. There is one point, however, in connection with this substance which is of some importance. The commercial article frequently contains a considerable quantity of sulphuretted hydrogen, the ultimate product from the distillation of the pyrites in the coal. The introduction of this gas into miasmatic localities cannot be a desirable addition, and it should be a *sine qua non* with manufacturers that they would supply it free from this contamination. Another very good reason for this is the fact that the absence of this gaseous product can be easily insured. There is very little sulphuretted hydrogen retained by the carbolic acid itself, but it is principally contained in the small quantity of water mechanically mixed with that liquid. A stream of sulphurous acid gas passed through the crude carbolic acid for a few minutes will effectually remove any traces of sulphuretted hydrogen. It should smell distinctly of the sulphurous acid, as the presence of an excess of this acid will add to its antiseptic properties, and will not add one farthing per gallon to the cost. We would feel inclined to condemn any carbolic acid intended to be used for disinfection which blackened acetate of lead paper on holding it over the orifice of the vessel that contained it. For purifying small quantities a little of the liquid sulphurous acid of the British Pharmacopœia may be used.

C. R. C. TICHBORNE, F.C.S., &c.

THE MEDICAL CLUB.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have observed with considerable interest the notices that have from time to time appeared in your journal respecting the proposal to establish a medical club, and, as I have had unusual experience in similar institutions, I hope a few hints may not be unkindly received by those who are interested in the undertaking:—First of all, to ensure success, confidence must be felt by all inclined to join it, and this, I am happy to think, can scarcely fail to be the feeling of the profession with the name of Mr. Probert as Treasurer. But you are aware, Sir, that all medical men are not necessarily possessed of business tact, nor indeed need I scruple to say that only very few of our leading men are remarkable for that talent, editors, of course, with due deference, excepted. It is for this reason I would urge upon the promoters at first, and the members afterwards, to elect on their committee gentlemen who would really take an active part in the management, as well as some whose professional renown will shed a lustre over the whole body.

The question of a name for the club has already caused some discussion, and is not yet decided. But one thing, to my mind, is clear—viz., that however the name may imply that the club is chiefly a professional one, yet it ought not, in fact, to be so *exclusively*. We ought not to exclude from our club a certain number of gentlemen not actually members of our profession. Indeed, it may be a question whether we ought not to encourage them by offering peculiar facilities. Medicine is happily, in the present day, wedded to science, and to exclude scientific men from a medical club would appear too much like seeking a divorce.

There are many great names that would add much to the influence of the club would they consent to be enrolled, but who are not medical men. We ought to cultivate the brotherhood of all labourers in any branch of science. I would go further and open the doors to the literary world, perhaps even to every *educated gentleman*.

Well, Sir, when the name and the constitution are both settled, the first practical step will come—procuring a house and making a start. To utter a warning on this point is my chief object. All I need say is, do not be too ambitious!

I have seen half a dozen clubs collapse through rushing into too great expenses at first. Several of them might have been most flourishing had they been content to “first creep and then run.”

Now, Sir, use your influence in this direction. Urge upon this new society, that it may become the representative of the highest and noblest portion of the profession—if willing to grow *by degrees*. As soon as 200 members are enrolled a start, *in a small way*, ought to be made. A young man taking apartments before burdening himself with a house, is the example to follow. As soon as the club is seen to be in good working order many candidates will apply for admission, and, as the club grows, the entrance fee should rise, and the difficulty of getting elected increase, until to belong to it is considered a great honour and experienced to be a great convenience.—I am, Sir,

AN INTENDING MEMBER.

October, 1866.

IMPROVED FLAP AMPUTATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I do not know whether the following plan of amputating above the knee is known to the profession or not. I have never seen it performed or described before, but I have often thought of it as an improvement, and lately practised it, with, what I consider, good effect.

It is a mode of forming the anterior flap, which better ensures its being of the proper size, and renders the operation both more easy and more rapid in execution than transfixion.

Standing as usual on the left hand side of the limb to be removed I grasp the thigh, placing my left thumb and middle finger on the two points which I wish to mark as the angles of the flaps, I then raise the soft parts thus grasped as much as possible from the bone, and applying the heel of the long transfixion knife to the front of the limb, and at the point which is to form the extremity of the anterior flap, I, with one stroke, divide all the parts in front of the bone as high up as my finger and thumb, which continue to grasp the flap as it is formed. The knife is then drawn through from right to left until its point clears the left side of the bone, under which it is then slipped and pushed on from left to right until it appears at the opposite side of the limb, when another stroke completes the formation of the posterior flap; the severance of the limb is then concluded as usual.

The peculiarity consists in the formation of the anterior flap by cutting from without, or from the skin to the bone, instead of the contrary.

Having recently tried it I can speak with confidence of its results, the limb having been severed well within thirty seconds, and the flaps fitting as if they had been measured.—I am, Sir, your obedient servant,

HENRY THOMPSON, M.D.,
Surgeon to the Tyrone Infirmary.

Omagh, October 26, 1866.

SMITH'S TEST FOR OZONE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I observe that Dr. Day, of Geelong, Victoria, in a letter of his on “Ozone as a Sanitary Agent,” which appeared in your number of the 24th inst., says that he has been in the habit of determining the state of purity of the sick room by means of the permanganates air-test recommended by Dr. Angus Smith. It would, I am sure, be of great use to the profession if Dr. Day would be good enough to describe the “Smith's air-test” employed by him, for that instrument has hitherto been a mystery in this country, notwithstanding that the results obtained from it, according to Dr. R. Angus Smith, have been so freely quoted by writers on sanitary subjects.—Yours obediently,

TEST.

London, Oct. 27, 1866.

P.S.—Perhaps you, Mr. Editor, can say where Smith's test can be procured, also whether you have ever seen it or known any person who had seen or used it?

Dr. BUCKLAND states that Chichester is more liable to earthquakes than any other place in the kingdom, in consequence of its being on the continuation of the Isle of Wight formation.

THE TRADE IN PHILANTHROPY.

THE Association for the Elimination of Benefits from Ill Winds has in a marked degree retarded the development of public benevolence in respect of the victims of the cholera epidemic in Dublin, and those who have seen their opportunity to push their own cause in the present misfortunes of the poor are turning the occasion to account by a vigorous inflation of the existing panic and their own philanthropic trumpet. Notably has the chance been improved by the authorities of Sir Patrick Dun's Hospital, who have scarcely permitted an issue of the daily papers to appear without a sensational picture of the horrors of the malady, a pseudo-scientific lecture, or a virtuously indignant declaration against the Poor-law authorities from the pen of their Secretary, the Reverend Professor Haughton. No doubt the line adopted by that gentleman has received the full concurrence of the Board of the Hospital, and, if so, it appears to us that it combines with singular infelicity a derogation of the dignity of the University of which Professor Haughton is Fellow and Medical Registrar, and of the Hospital to which he is Secretary. A misapprehension which seems to have taken hold of that gentleman's mind is, that national gratitude is the just reward to the staff of Sir Patrick Dun's Hospital, for the resignation with which they have immolated themselves on the shrine of the public good. He seems to vastly over-estimate (and to desire that the subscribing public should over-estimate) the very common discharge of duty which every physician undertakes, and which it would be a gross dereliction for an hospital specially intended for infectious diseases to refuse. The Physicians and Surgeons of the Meath, Mater Misericordiæ, and the Hardwicke Hospitals have done as much or more than those of Sir Patrick Dun's, and yet they have not considered it necessary to air their magnanimity through their respective secretaries; and it would be an insult to the Medical Officers of other Hospitals to think that, had circumstances permitted, they would have for an instant hesitated to vie with the staff of Sir Patrick Dun's in any good work.

The monetary result of all this agitation has been utilised by a meeting organised in Trinity College to persuade the Fellows and Graduates of the University into contributing towards the funds of the Hospital. We are not aware whether the audience at that meeting were fully aware of the fact that Sir Patrick Dun's Hospital has received, or will receive from the Poor-law Guardians a fair payment for every case admitted from a certain district, and that the Hospital is therefore little, if any, the poorer of the demand on its resources, which the public is now asked to meet.

Not the least objectionable feature of the whole proceeding is that the occasion has been made use of to transfer from the City of Dublin Hospital to Sir Patrick Dun's the grant hitherto made by the city for its maintenance. This institution, in common with

every other Hospital in Dublin not provided with special fever wards, was obliged, in justice to its other patients, to refuse admission to cholera cases, and yet it has been attempted to isolate it from all institutions under similar circumstances, and place its revenues to the credit of institutions not one whit more deserving of public confidence.

The Board of Sir PATRICK DUN's has spent the last two months "thanking God that they are not as other men are." We respectfully suggest that their time may be judiciously employed in a revision of the very indiscreet newspaper effusions of their Secretary, who, in our opinion, has not made a judicious change from the elucidation of the sciences, which his great talents have adorned, to the pursuit of newspaper celebrity, either in the departments of artistic hangmanship or clerico-medical agitation.

OBITUARY NOTICE.

THE LATE DR. BARLOW.

AT Longton Lodge, Sydenham, on October 13, George Hilario Barlow, M.D., aged 60. So runs the brief notice that another of our veterans has been called away from the sphere he so long filled and adorned. Dr. Barlow has been Physician to Guy's Hospital for twenty-three years, and was well known to all the busy practitioners of London, especially perhaps those of the Southern suburbs. As a teacher he was esteemed by many who could fully appreciate the absence of dogmatism which especially characterized him. Full of learning and experience, it was necessary for those who would make the most of his conversation to endeavour to place themselves on a level with him, or, if that could not be done, patiently learn from his well-stored mind the many aspects of the case. He was destitute of that showy tact and positiveness which is often mistaken for precise information. Thus, while many might be more successful in gaining the confidence of the public, few men could be selected whose general bearing and extensive knowledge offered a better example of what a physician should be. He was some years editor of "Guy's Hospital Reports," in which are many of his most valuable contributions to medicine. His "Manual of the Practice of Medicine" (one of Churchill's series) has long been in the hands of a large proportion of the profession.

BELFAST QUARTER SESSIONS.

(Before J. H. OTWAY, Esq., Q.C.)
(From the *Northern Whig* of October 25.)

HIS Worship took his seat in Court shortly after ten o'clock and resumed the business of the Quarter Sessions.

H. H. Bottomley, Esq., Sub-Sheriff, was present during the day.

THE EXPENSES OF MEDICAL MEN.

At the sitting of the Court,

Mr. Seeds called attention to the fact that several medical gentlemen, who had been in Court since the opening of the sessions, had only got one guinea for expenses, which was quite inadequate.

His Worship—It is a very great hardship, and may more or less interfere with the course of justice.

Mr. Seeds said that, in the case of Dr. Rea, who was a dispensary officer, he had been obliged to procure a substitute, and his expenses would not more than half pay that substitute

His Worship—I recommend that gentleman to memorial the Government, and call attention to the subject.

Mr. Birney, Sessional Crown Prosecutor, said he had got a circular from Government, and he could not give more. If he had the power, he would gladly do so.

Mr. McLean said a better arrangement might be made with regard to the attendance of medical witnesses by sending a policeman for them when their presence was required.

Mr. Rea said the Castle had no power to curtail the expenses. The docket was signed by the Clerk of the Peace, and they had no right to send these circulars to Mr. Birney at all. The power was unlimited, and it was very dangerous to allow the Castle to have anything to do with it. His Worship could make an order with regard to expenses.

His Worship said, if the Act were referred to under which he had the power, he would gladly exercise it.

Mr. Birney—I cannot disobey the directions I have received.

The Clerk of the Peace (Mr. W. C. Cunningham)—It is the Court grants the expenses, but it is upon the prayer of the prosecutor.

Mr. Rea—These Castle circulars should be disregarded.

Dr. Rea—We'll adopt your Worship's suggestion, and send a memorial to the Castle.

His Worship—Don't say I recommended you.

Mr. Rea—You may use my name, as I am no great favourite at the Castle. (Laughter.)

Notices to Correspondents.

Kappa.—Thanks for your note, for which we may find room.

B.—We saw the article alluded to. It is beneath notice.

Dr. G.—The "description" you send is not adapted for our columns.

S. A. T.—The Scotch and Irish schools do not open till November 2. The only reason we did not publish other introductory addresses, was want of space. We gave eight pages extra matter for two weeks in order to publish all we did. No other journal has given so full an account.

A New Subscriber will find all he mentions in our columns.

The Harveian Society of London.—The notice has been received.

Mr. H. S.—The offer is declined with thanks.

A Subscriber must be in error, as we are not aware that there is any cure for the affection in question, except by a surgical operation.

Dr. M.—The subject has been already fully discussed in our columns.

A Fellow.—We shall be glad to receive the communication alluded to.

Dr. Seaton Reid.—We regret that the late hour at which the addition to your communication came to hand prevented us from inserting it.

Dr. Harrison Gargrave, Leeds.—Your correction has been by mistake made in the address of another subscriber for the last two issues. We will have it remedied.

Dr. Griffiths.—Your communication is inserted, but we think nothing can be gained by a continuance of the controversy.

Dr. Kidd.—No notice whatever can be taken of articles or communications, unless sent in the usual course to the Editor of the English department, 20, King-William Street, Strand.

Lex.—Our correspondent has not afforded us an opportunity of estimating the value of his opinion by letting us know his name. We regret that editors are not of the chameleon complexion, to please all parties. We have had an all-powerful motive, which *Lex* seems to think too preposterous, the desire to maintain the education of our profession by discountenancing obsolete monopolies, which are as injurious to the institution in which they exist as to the general tone of the profession.

Communications, &c., from Messrs. Bedford Brothers; Dr. Mitchell. London, Dr. Kidd.

"Subscriber".—The salaries vary, but may be estimated to be equal in value to about £150 ashore. You will obtain full information by writing to the agents in Liverpool. We cannot recommend such appointments to gentlemen intending hereafter to enter private practice in England.

Medical News.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—At a general meeting of the Fellows, held on October 17th, the following gentlemen were reported by the examiners to have passed the primary examination for the licence:—

Charles Holte, B. B. Allen, William Anderson, Albert Henry Baines, James Wm. Barry, John Batley, Frederick Henry Blenkinsop, Clement Dukes, Branford Edwards, Alfred Henry Garrod, James Frederick Goodhart, Saltern George Littlejohn.

APOTHECARIES' HALL OF LONDON.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on October 18th:—

De Morgan, Edward, Adelaide-road, N.W.
Kinsey, Robert Henry, Thurlow-road, Hampstead.
Mickleth, Arthur George, Buntingford, Herts.

The following gentlemen also on the same day passed their first examination:—

Burford Norman, Guy's Hospital; J. A. Bevan, do.; J. B. Saundry, do.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.—Names of Candidates who passed the Major Examination as Pharmaceutical Chemists, on the 17th October, 1866:—

Heald, Benjamin, Sleaford.	Price, William, Birmingham.
Jones, Rowland P., Llanrwst.	Skinner, Thomas, Cirencester.
Martindale, William, Carlisle.	Wallwork, Joseph, Tyldesley.
Pratt, Joseph, Stratford-on-Avon.	Wilson, John Henry, Driffield.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—The following gentlemen obtained the Licence to practise Medicine in the months of July, August, and September, 1866:—

Anderson, Despard, Carlow.	Hewitt, David B., Dublin.
Archdall, Gordon, Bundoran.	Hyde, Henry, London.
Bastable, Daniel, Kanturk.	Ireland, Richard, Galway.
Beatty, John G., Dublin.	M'Swiney, John (B.N.), Walmer.
Begge, Joseph T., do.	Morgan, Jerome, Rathgar.
Benson, John H., do.	Neary, Bernard, Dublin.
Bolster, Thomas, Mallow.	Olden, D. L., Dungarvan.
Brown, Anthony, Boyle.	O'Reilly, D., Ranelagh.
Carey, Richard, Newtownbarry.	O'Reilly, Thomas, Kilkenny.
Carre, Fenwick, Inver.	Pendleton, R. W., Trim.
Dunne, George, Delgany.	Ratigan, Alfred, Rostrevor.
Fair, Campbell, Oughterard.	Ridley, James, Tullamore.
Fitzgerald, Richard, Dublin.	Rougham, Geo., Ballinrobe.
Harding, W. T., 2 Batt. 19th Regt.	Watson, Chris., Dublin.
Healy, Michael, Askeaton.	

The following gentlemen obtained the Midwifery Diploma during the same period:—

Anderson Despard.	Olden, Dominic Lynch.
Beatty, John Guinness.	O'Reardon, Daniel.
Brown, Anthony Lennon.	O'Reilly, Thomas.
Carey, Richard Brown.	Pendleton, Richard W.
Carre, Fenwick.	Ratigan, Alfred Henry.
Cuppige, Thomas, Lurgan.	Saunderson, James, Edenderry.
Dunne, Richard Newman.	Watson, Christopher.
Fair, Campbell.	

AN Inquest was lately held on the body of a German governess, who died suddenly at Pimlico. On post-mortem examination a hydatid containing the ova of tapeworm was found on the right hemisphere of the brain about the size of a small nut. The cavities of the brain contained six ounces of serum, and six or seven hydatids were found in the fourth ventricle.

THE adage that "too much of a good thing is good for nothing" has been painfully illustrated in the death of Dr. Thomas Hall, Inspector-General of Hospitals. It came out at the inquest which was held on the body of the deceased that he had suffered much from gout and had been in the habit of taking Deville's anti-gout mixture to allay the pain of that disease. Deville's mixture is sold in bottles, accompanied with precise directions as to the quantity to be taken at a dose. Dr. Hall in his agony swallowed *thirty-six doses in one*, and died almost immediately.

RETIREMENT OF DR. DUNCAN FROM THE ADELAIDE HOSPITAL, DUBLIN.—At the meeting of the committee on Tuesday, 23rd October, 1866, it was resolved unanimously—That the committee of the Adelaide Hospital cannot allow Dr. Duncan's official connection with it to terminate without the expression of their grateful sense of the services he has rendered to the institution. They are aware that by his liberal contributions to its building and support, by his constant and successful efforts to increase the number of its friends, by his judicious counsels in seasons of difficulty, and by the exercise of his professional skill as one of its physicians, Dr. Duncan may be said to have done more than any other individual in placing the Adelaide Hospital in its present prosperous condition. While the committee now record their regret that they can no longer number him among the medical officers of the institution, they have the pleasure of knowing that his interest in the welfare of the hospital will continue unabated, and that they can always reckon upon his counsel and aid in any time of need.

THE UNIVERSITY OF CAMBRIDGE.—The Professor of Anatomy commenced his course of lectures on Human Anatomy and Physiology, on Tuesday, October, 23, at one P.M., which will be continued on Tuesdays, Thursdays, and Saturdays at the same hour. These lectures will be suitable to students of natural science, as well as to medical students. The demonstrations and the instruction in practical anatomy will be conducted in the old Anatomical Schools, and will be continued in the Christmas vacation. There will be microscopical demonstrations on alternate Mondays during term, at seven P.M., in the old Anatomical Museum, commencing on the 29th inst.

WHAT is the bent of the following, which appears in the *Dublin General Advertiser*:—"Doctors and Surgeons in high practice throughout the United Kingdom may, by conferring a real public benefit, materially increase their incomes; confidential. Address Mr. D. * * * *"

It is with regret we have to announce the death of Inspector-General of Hospitals, Dr. J. C. Carter, half-pay. The melancholy event occurred early on Saturday morning. Dr. Carter was a most zealous and efficient medical officer, and ably superintended the medical department during the years 1854-55, when, owing to the numerous embarkations of troops for the Crimea, his duties were of the most onerous description. He is deeply regretted not only by his brother officers but also by a large circle of acquaintances, being much esteemed for his many amiable qualities.

The celebrated Japanese traveller, Dr. von Siebold, died at Munich on the 18th instant, of typhus, at the age of seventy-one. He has left a rare collection of manuscripts.

FRENCH PHARMACOPOEIA.—The last issue of the French Pharmacopœia appeared in 1837; a new edition has just been prepared, the result of the labours of an Imperial Commission during the last three years. In addition to the changes rendered necessary by the progress of science, the *Journal of the Society of Arts* says the formulæ have been drawn up as far as possible in accordance with those of neighbouring countries, and an appendix has been added, containing foreign formulæ of recognised value. The new edition is therefore regarded by its authors as the first approach towards that grand desideratum, a universal pharmacopœia. In this age of rapid travelling, says the commission, chemists may be called upon to make up the prescriptions of medical men residing at great distances, and, therefore, local pharmacopœias have had their day; nothing but one recognised by all the scientific world is worthy of the time; but, in order to produce such a work, the concurrence of various governments is as necessary as for the generalization of money, weights, and measures. In the meantime France takes the first step on the road, and it is hoped that her endeavours will not be repulsed, and that the world will be endowed with another element of public health and security; it is hoped, amongst other things, that other nations will not persist in their special doses in the case of medicines containing active and dangerous poisons, such diversity in practice creating unnecessary perils for invalids, a preparation bearing the same name, being in one place too weak and ineffective, and in another too strong and dangerous.

DURING the past year only two candidates were examined for the dental diploma of the London College of Surgeons, both of whom passed.

THE SANITARY IMPROVEMENT OF EDINBURGH.—At a special meeting of the Town Council held on October 1, it was agreed, by a majority of 22 to 12, to proceed with the scheme of sanitary improvement promoted by Lord Provost Chambers. The scheme involves an expenditure of about £200,000, which it is proposed to raise by an assessment of 2d. in the pound continued for 20 years. The improvements proposed include the clearing out of old properties in some of the more densely crowded localities, and the opening up of other portions by cutting new streets through them. It also includes the formation of a wide street to the north of the University, by which the Museum of Science and Art, recently inaugurated by his Royal Highness the Duke of Edinburgh, will be thrown open to better view. The division in the Council took place on the question whether the plans should be proceeded with at once, or should lie over till after

the November elections. A portion of the dissentients tabled a protest against being held personally liable for any steps taken. At a very full meeting of the Merchant Company, it was unanimously resolved to support the Lord Provost in his scheme.

DR. DAY, LATE OF ST. ANDREWS.—The numerous professional and other friends of Dr. Day, late Professor of Medicine at the University of St. Andrews, will be glad to learn that, although still disabled from ordinary medical work, he has so far benefited by the genial air of Torquay as to be able to take charge of one or two young lady patients, for whom a residence in Devonshire may be desirable, and who would be received into his own family.

On Friday, at the meeting of the Chémico-Agricultural Society of Ulster, in Belfast, Dr. Hodges exhibited a large mass of heavy solid substance, taken from the stomach of a horse which had died from inflammation. It weighed seven pounds, and was almost round, resembling in shape a great cannon ball, and on examination it was found to be composed principally of phosphate of magnesia and the hairs on the husks of oats. This large stone, as it may be called, was the cause of the horse's death.

IMPROVED DWELLINGS FOR THE POOR.—The Liverpool Town Council adopted a recommendation of the Health Committee to borrow the sum of £13,000 from the Public Loan Commissioners, to be expended in the erection of dwellings for the working classes on land belonging to the Corporation in the overcrowded districts, where the density of the population is greater than that in any other town, not excluding the east-end of London.

It is proposed to establish in Lancashire an asylum for idiots and imbeciles belonging to the seven northern counties (including Cheshire). It is alleged that there are upwards of 13,000 cases in these counties, and there is no asylum into which they can be admitted.

COMPARISON OF THE RIGHT AND LEFT CLAVICLES.—Dr. Wyman, alluding to the want of symmetry in the two clavicles, laid before the Boston Medical Society the measurements and weights which he had made in nine pairs. Of these the maximum length was 6.40 inches, and the minimum 5.35 inches; the maximum weight 30.700 grammes, and the minimum 10.240. The right clavicle was longest in one pair, and the left in five pairs, the clavicles being of equal length in three. The right clavicle was heaviest in five pairs, the left in three.—*Boston Journal*, July 19.

LONDON SEWAGE.—The Reclamation Company, now actively engaged on the north side of the Thames, has already tested the value of the metropolitan sewage, and contemplates its regular and systematic utilisation on a farm which the company is about to purchase. Early in April last a plot of waste land at Barking Creek, devoid of surface soil, was covered with common sand, brought from Mapping, near Shoeburyness, to the extent of two feet thick, on which was sown grass seed. The surface was then well irrigated with ordinary London sewage from the northern outfall. This has been repeated once or twice. The effects of this manufacture of green meat—for such, indeed, it may be most justly considered—has been the production of three crops; one cut in June and July, at the rate of sixteen tons per acre; a second of eight tons; and a third now growing, and almost ready for the scythe.—*Sunday Gazette*.

THE HUNTERIAN MUSEUM.—From the last annual report of the Council of the Royal College of Surgeons, it appears that Parliament having voted £42,500 for the purchase of the extraordinary collection formed by John Hunter, and towards the erection of suitable buildings for its display and preservation, the large sum of £61,000 had been supplied from the College funds up to 1847, when, further enlargement of the building having become necessary by the continued increase of the collection, the Council of the College in that year purchased the extensive premises of Mr. Alderman Copeland in Portugal street, formerly the site and part of Ben Jonson's theatre, for the sum of £16,000, and in 1852 proceeded to the erection of the eastern museum at an expense of £25,000, Parliament granting £15,000 in aid thereof. The re-arrangement of the specimens

was completed, and the additional portion of the building opened to visitors in 1855, since which time considerable and most valuable specimens have been added by purchase and donation. Mr. Flower, the indefatigable Conservator of the Museum, has for some time past been exploring the osteological stores which have been accumulating for many years in the subterranean apartments of the College, which are now gradually yielding up their treasures to enrich the Museum. Amongst the particularly valuable additions from this source which appear to have escaped the attention of previous Conservators, is the skeleton of that rare and probably extinct bird the great auk (*Alca impennis*), of which only three other skeletons are known to exist in Europe, and none so perfect as the specimen lately added to the collection. Some of the bones of this valuable Hunterian specimen were already catalogued in the collection, but without any reference to the remainder being in the possession of the College, until the examination of the boxes in the store-room during the present year brought to light all the others required to complete the skeleton, with a few unimportant exceptions. It is the eggs of this bird which at recent sales by auction of objects of natural history have realized upwards of £30 each; there are half a dozen in the Hunterian collection. Another interesting addition is a skeleton of the awantibo (*Arctocebus calabarensis*), a lemuroid animal from Old Calabar, presented by Mr. A. Murray, and at present the only skeleton of the genus known to exist. The skeleton of another very rare animal, allied to the last mentioned, but presenting several remarkable peculiarities of conformation, the aye-aye (*Cheiromys madagascarensis*), has been added during the past year by purchase. An interesting discovery was made in the latter part of last year, in the Island of Mauritius, relating to that remarkable bird the dodo (*Didus ineptus*), once an inhabitant of that island, but extinct for nearly two centuries. The head and foot were the only parts previously known, and these presented such anomalous characters that much speculation existed among naturalists as to the structure of the other portions of the skeleton. For many years numerous searches have been carried on in various parts of the island to endeavour to find further remains of this once frequent inhabitant, but hitherto in vain. The curiosity felt upon the subject was at last gratified by the discovery, while draining a marsh, of many bones of numerous individuals undoubtedly of this species. As a portion of these were sent to this country and offered for sale, the College was enabled to secure, at a moderate cost, some of the most characteristic bones. The late Mr. Gordon Cumming's collection has been put under contribution, and some interesting specimens added to the Hunterian collection.

SURGICAL ACCIDENTS IN FACTORIES.---In the Reports of Inspectors of Factories for the six months ended April 30th, 1866, 2576 accidents from machinery are recorded; of these twenty-eight were fatal, and six of the fatal cases were children. Thirty children also suffered amputation of part of right hand, and twenty amputation of part of left hand. Sixteen got fractured limbs and bones of trunk; thirty-two, fracture of hand or foot; and sixteen, injuries to head and face.

SLAUGHTER-HOUSES AND RAILWAY CONVEYANCE.---One of the local Acts passed in the late session has been printed. It provides for the erection of a central railway station at Ryde, and of slaughter-houses for cattle by the company, and the imposition of tolls. In the event of metropolitan slaughter-houses being removed by an Act in the next session, others will be built out of town, with increased facilities for sending the meat to the London markets.

SEVERAL PERSONS POISONED BY NORWEGIAN SHELL-FISH.---The *Glasgow Daily Herald* gives the following particulars of the deaths of two ladies and a gentleman, supposed to be caused from eating shell-fish:—"Mr. Forbes, on his return this week from Manchester, brought some Norwegian crab shell-fish, and on Wednesday evening had a few friends to supper, when they all partook of them. On Tuesday morning they were all seized with choleraic symptoms. Mr. Bain about two P.M. feeling himself getting worse, proceeded to the hospital in Parliament-road; but, although everything was done that skill could suggest, he died on Friday night at a quarter to twelve. Mrs. Darling and Mrs. Merry had the prompt services of several able medical gentlemen; but

they have both succumbed, Mrs. Darling having expired at eleven o'clock on Thursday night, and Mrs. Merry at nine on Friday morning. Mr. and Mrs. Forbes, and Messrs. Darling and Merry, according to our latest intelligence, having been only slightly affected, are all recovering. The symptoms, the appearances, and the suddenness of the three sad deaths are all believed to be choleraic, but attributable not to the locality, but to something poisonous in the Norwegian shell-fish, of which, as we have stated, they had all partaken."

SALE OF DISEASED MEAT IN DUBLIN.---The Hon. J. P. Vereker, formerly Lord Mayor of Dublin, writes as follows:—"It is not possible for all the exertions of the Lord Mayor and his officers to prevent diseased meat being sold so long as Dublin contains 180 licensed slaughter-houses! Surely it is obvious that the greatest sanitary requirement for Dublin is a public slaughter-house, where all beasts used as human food will be slaughtered and dressed in the presence of a competent inspector. Thus not only will the circulation of diseased meat be altogether put an end to, but 180 houses (I might almost call them plague-houses), situated in the most crowded parts of the city, will be closed. Such a slaughter-house will require enormous sewerage accommodation, and in my opinion no scheme for purifying the Liffey and improving the city sewage will ever be perfect unless undertaken in connection with the establishment of a clean, well-ventilated public slaughter-house. Till a public slaughter-house is erected the great sewage question can never be satisfactorily disposed of. I do not believe the citizens have any adequate conception of the quantity of diseased meat now selling in Dublin. At one of the last meetings of the Public Health Committee, Professor Cameron, the city analyst, produced a disgusting piece of meat cut from the soundest part of half the carcass of a bullock seized by the police. I asked where the other moiety of the beast was, and was informed that it had escaped the vigilance of the police, and was doubtless sold as food to the poor!"

An old stable, with 100 infants in the horse-troughs and hay cribs, is rather a novelty, but is to be seen in the locality of Union-street, Borough-road, London. The work has been undertaken by the Rev. George Aldington, who has secured an old stable to form a nursery, and has fitted it up for taking care of the young children of women who are obliged to go out to char or work away from home.

ONE of the latest additions to the Museum of the Royal College of Surgeons is a perfect skeleton of the Great Auk—a supposed extinct bird—of which only three other examples are known to exist in Europe. This skeleton, which has been recovered from the accumulations of many years, deposited in the cellars of the Museum, is in better condition than the others. Skeletons of the Awantibo, a lemuroid animal, and of the Aye-Aye, have been added to the collection during the past year.

THE Metropolitan Sanitary Commission gives some interesting facts about drainage. For every inch of depth of water drained off which would otherwise pass into the air as vapour, we are told as much heat is saved per acre as would raise 11,000 cubic feet of air one degree in temperature. The dew point, too, is raised; hence less mist and dampness (as we all know) is more uncomfortable than cold. A farmer, says the Parliamentary report on drainage, was asked the effect of some new draining: "All I know is," replied he, "that before it was done I never could go out at night without a great coat, and now I never put one on. It just makes the difference of a coat to me." A doctor took one of the Sanitary Commissioners to a hill overlooking his district. "There," said he, "wherever you see those patches of white mist I have frequent illness; and if there's a cess-pool or other nuisance as well, I can reckon on typhus every now and then. Outside the mists I am rarely wanted." Damp, it seems, gives double energy to ill odours of all kinds. What a pity everybody cannot live on a hill-side with a good gravel subsoil.

DR. OGLE'S FORMULA FOR CHLORODYNE.---Chloroform, fʒvi.; Chloric Ether, fʒi.; Tinct. Capsici, fʒss.; Oil of Peppermint, gtt. ii.; Morphia Mur, Grains 8; Hydrocyanic Acid, xij. (Schuls); Perchloric Acid, gr. xx.; Tinct. Cannabis Indica, fʒi.; Treacle, ʒi.

A COMPANY has been formed for the purpose of laying street tramways through Dublin on a gauge of rails of 5 feet 3 inches, "being equivalent to that upon Irish railways, and better than the narrow gauge of 4 feet 8½ inches in operation in England." The Town Council do not oppose the scheme, and it is presumed that the commissioner appointed by the Board of Works to inquire into its merits will, under the circumstances, report in its favour. The first line proposed will pass right through the city, from Merrion-square, and along the South Quays to the Phoenix Park.

A DINNER has been given in Paris consisting entirely of smoked, salted, and pressed Brazilian beef. M. Payen, member of the Academy of Science, M. Berthoude, of the *Patrie*, and M. Jouslin, of the *Evénement*, were amongst the ten jurors empaneled to test the merits of the meat, which was served up in the shape of soup and bouilli, beef à la mode, and sausages. A unanimous verdict was pronounced in favour of Brazil as a beef-supplying ally of France.

THE POOR-LAW MEDICAL INSPECTORSHIP.—Dr. Kidd, of Ballymena, is a candidate for appointment to a vacancy in the above office. We have the pleasure of stating that, at a meeting of the Board of Guardians of Ballymena Union, held on Thursday last, it was unanimously resolved that his claims to the appointment be cordially supported by an official representation to the Poor-law Commissioners; and that, in the opinion of the Guardians, he is in all respects well qualified to discharge the important duties of a Medical Inspector with credit to himself, satisfaction to the country, and advantage to the public service.—*Ballymena Observer*. [We are much gratified to quote the above paragraph. Dr. Kidd is believed by all who know him to be a most suitable and competent person to fill the office alluded to, which is soon expected to be vacant. Owing to the length of time he has been engaged in the Poor-law service, his claim is considered to be very strong, as he is a well-tried officer, and thoroughly acquainted with the working of the system. We understand that Dr. Kidd has been strongly recommended by Lord Antrim, Colonel Adair, and many others in high position, who are well acquainted with his qualifications and fitness for the appointment. We have also heard that a strong memorial from his medical brethren, numerous signed, has been transmitted to the Poor-law Commissioners praying for his appointment.—Ed. B. N. L.]

THAT disgraceful because entirely preventible disease called scurvy appears to proceed without let or hindrance among the seamen of our mercantile marine. No less than six large vessels have entered the port of London during the past ten days with cases of scurvy on board, and we are informed that some of these cases are of the worst description. As long as filthy mixtures miscalled lime-juice are shipped for the use of crews, and, even if good juice be put on board, no attention is paid to its proper preservation or regular distribution, it is certain that this disease will prevail.

THE Glasgow correspondent of the *Scotsman* says: "Dr. Moore, who attended Mrs. Darling and Mrs. Merry, gives it as his opinion that those ladies died of cholera, and Mr. Bain's case has been reported at the Sanitary-office as one of choleraic diarrhoea. Dr. Gairdner, who was called in at Ibrox-terrace, will not take it upon him to say whether the deceased ladies died from cholera traceable to no particular cause, or whether the deaths have resulted from the eating of the crabs. The latter supposition seems strongly supported by the coincidence of so many persons being seized who had been members of the same supper party. Mrs. Forbes has also been ill, but we understand is recovering."

MIXED VAPOURS.—Two cases of death from mixed vapours of ether and chloroform are referred to in the *Observer* newspaper. Hitherto it was believed that the mixed vapours were harmless.

The *Association Journal*, or *British Medical*, loses the services of Dr. Markham as editor, and a committee has been sitting to appoint a new occupant for the editorial chair. Dr. Murchison, it is said, is one of the favourites; Dr. Richardson and Dr. B. W. Foster are also mentioned as candidates. Dr. Kidd is another candidate, resting his claim on a long service of gratuitous hospital reports, on "Gleanings" from the London hospitals, and a promise of Sir Charles Hastings.

THE LAW OF CORONERS' INQUESTS IN ENGLAND.

A correspondent of the *Medical Times and Gazette* asks:—(1.) Where an inquest ought legally to be held—whether in the house or room where the deceased person lies, or in a house or "Coroner's Court," possibly some considerable distance away, or whether it may be held at one or the other, at the option of the Coroner? (2.) Whether a Coroner can compel a House-Surgeon to leave his hospital duties and attend such "Coroner's Court" for the purpose of giving evidence? and (3.) Whether, if it is compulsory, a House-Surgeon is not entitled to a fee (as other practitioners are) for such attendance?

*. (1.) By the statute *de Officio Coronationis*, 2 Edw. I., st. 2, "the coroner, upon information, shall go to the place where any be slain or suddenly dead or wounded; and shall forthwith command four of the next towns, or five or six, to appear before him in such a place, and when they are come thither, the coroner, upon the oath of them, shall inquire in this manner—that is, to wit, if it concerns a man slain, whether they know where the person was slain, whether it were in any house, field, bed, tavern, or company, and if any and who were there." It is not, however, necessary that the inquisition should be taken at the place where the body lies, provided it is taken within the same jurisdiction; and the coroner may adjourn the jury from one place to another, provided that the real place at which the inquest is held be stated in the inquisition. The inquest may be held in the room or house where the body lies, or in any other house within the jurisdiction; and wherever it is held that would be the "coroner's court." (2 and 3.) The fifth clause of the Medical Witnesses Act enacts—"V. Provided also, and be it further enacted, that when any inquest shall be holden on the body of any person who has died in any public hospital or infirmary, or in any building or place belonging thereto, or used for the reception of the patients thereof, or who has died in any county or other lunatic asylum, or in any public infirmary or other public medical institution, whether the same be supported by endowments or by voluntary subscriptions, then and in such case nothing herein contained shall be construed to entitle the medical officer whose duty it may have been to attend the deceased person as a medical officer of such institution as aforesaid to the fees or remuneration herein provided." But, in any other case, a "House-Surgeon" stands precisely on the same footing, with regard to fees and liability to be summoned by the coroner, as any other Medical Practitioner.

Late Publications in Medicine & Science,

(From the Publishers' Circular.)

- Cassell's Popular Natural History. With coloured Plates. Vol. 3. Birds. Royal 8vo, cloth, 10s. 6d.—Cassell.
- Crichton (A. W.)—A Naturalist's Ramble to the Orcades. 12mo, pp. 136, cloth, 4s.—Van Voorst.
- Frankland (Edward)—Lecture Notes for Chemical Students, embracing Mineral and Organic Chemistry. Post 8vo, pp. 440, cloth, 12s.—Van Voorst.
- Maunder (Samuel)—The Scientific and Literary Treasury. New edit. thoroughly revised and in great part rewritten, with upwards of 1000 new Articles. By James Yate Johnson. 12mo, pp. 820, cloth, 10s. 6d.—Longmans.
- Murray (William)—A Treatise on Emotional Disorders of the Sympathetic System of Nerves. Post 8vo, pp. 128, cloth, 3s. 6d.—Churchill.
- Musket (William Boyd)—A Practical Treatise on Apoplexy (Cerebral Hæmorrhage); its Pathology, Diagnosis, Therapeutics, and Prophylaxis; with an Essay on (so-called) Nervous Apoplexy, on Congestion of the Brain, and Serous Effusion. 8vo, pp. 198, cl. 7s.—Churchill.
- Parkinson (S.)—A Treatise on Optics. 2nd edit. revised. Post 8vo, pp. 320, cloth, 10s. 6d.—Macmillan.
- Popular Science Review. Vol. 5. 8vo, cloth, 12s.—Hardwicke.
- Stewart (Balfour)—An Elementary Treatise on Heat. 12mo, pp. 410, cloth, 7s. 6d.—Macmillan.
- In the medical literature we have a work on Diseases of the Stomach, by S. Habershon; a Treatise on the Emotional Disorders of the Sympathetic System of Nerves, by William Murray; Osteology, a Concise Description of the Human Skeleton, by A. T. Norton, with atlas and plates; a second volume of Reports of St. Bartholomew's Hospital Lectures, edited by Dr. Edwards and Mr. Callender; and a Treatise on Malignant Cholera, its Origin, Pathology, &c., by Edward Crisp.
- Messrs. Lovell, Reeve, and Co. have in the press a work by the Author of "Episodes of Insect Life," entitled "Live Coals, or Faces from the Fire," also "The Reasoning Power in Animals," by the Rev. J. S. Watson.—"Meteors, Acrolites, and Falling Stars," by Dr. Phipson.—"The Edible Mollusks of Britain," by Mr. S. Lovell.—"British Butterflies and Moths," by H. T. Stainton.—"British Seaweeds," by S. V. Gray, and "British Grasses," by M. Pluec.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Will you kindly inform me, through your columns, as to what prospect of promotion a young man now entering the Army Medical Services has? It is reported as being very bad.—Your obedient servant,

PATERFAMILIAS.

September 15, 1886.

[Promotion in the Army Medical Department is, and has been for some considerable time, at a dead stand still. It will be seen, by reference to this month's *Army List*, that there are now no less than thirty assistant-surgeons who have completed twelve years' service.—Ed. M. P. AND C.]

BOOKS &c. RECEIVED.

- Madras Quarterly Journal of Science. London: Robert Hardwicke, Piccadilly.
Belgravia. Edited by M. E. Braddon. London: Ward, Lock and Tyler.
Clinical Histories with Comments. By Dr. Henry Day. London: Churchill and Sons.
Flint on the Diseases of the Respiratory Organs. Second Edition. Philadelphia.
Canniff's Manual of the Principles of Surgery. Philadelphia.
A Practical Treatise on Fractures and Dislocations. By Dr. F. H. Hastings. Third Edition. Philadelphia.
Dr. Edwin Lee on Animal Magnetism. London: Longman. 1866.

Appointments.

LONDON.

- H. ANNOTT, M.R.C.S.E., has been appointed Surgical Registrar to the Middlesex Hospital.
W. CAYLEY, M.D., M.R.C.P.L., has been appointed Medical Registrar to the Middlesex Hospital.
J. CLARKE, M.D., M.R.C.P.L., has been appointed Obstetric Physician to St. George's Hospital, and Lecturer on Midwifery, vice Robt. Lee, M.D., resigned.
G. A. KENTON, L.R.C.P.L., has been appointed Assistant to the Obstetric Physician, St. George's Hospital, vice Barker resigned.

PROVINCIAL.

- J. M. TAYLOR, M.D., has been appointed House-Surgeon to the North Staffordshire Infirmary, Etruria, Stoke-upon-Trent, vice Wm. D. Spanton, M.R.C.S.E., resigned.
E. S. ROBERTS, M.R.C.S.E., has been appointed Superintendent of Quarantine on the River Humber, vice R. Hardy, M.R.C.S.E., deceased. Mr. Roberts has also been appointed Medical Officer to the Hull Board of Health.
G. SANKEY, M.R.C.S.E., has been appointed Surgeon to the West Kent General Hospital, vice Mr. F. Fry, resigned.
Mr. T. W. DANBY (first in the Natural Sciences tripos, 1864) has been appointed Superintendent of the Laboratory and Lecturer in Geology and Mineralogy; Mr. J. B. Bradbury has been appointed Lecturer in Comparative Anatomy and Physiology at Downing College.
H. M. COCKERTON, M.R.C.S.E., has been appointed Surgeon to the County Gaol, Montgomery, vice J. P. Wilding, M.R.C.S.E., resigned.
I. DE ZOUCHIE, M.D., has been appointed a Resident Medical Officer at the Workhouse, Liverpool.
T. G. HORDER, M.R.C.S.E., has been appointed House-Surgeon and Local Secretary to the National Sanatorium, Bournemouth, vice W. J. Wane, M.R.C.S.E., resigned.
J. L. JARVIS, M.R.C.S.E., has been appointed Surgeon to the Village Hospital, Capel Surrey.
G. BROWN, M.D., has been appointed Medical Officer for District No. 2 of the Colchester Union, vice D. P. Morris, M.R.C.S.E., resigned.
C. J. GOVERNTON, L.R.C.P.Ed., has been appointed Medical Officer and Public Vaccinator for the Herguldy District and the Workhouse of the Knighton Union, Radnorshire, vice H. Warren, M.R.C.S.E., deceased.
J. C. DUKE, M.R.C.S.E., has been appointed Medical Officer for the Lewisham District and the Workhouse of the Lewisham Union, vice H. Stott, M.R.C.S.E., resigned.
A. HAMILTON, L.R.C.P.Ed., has been appointed House-Surgeon to the District Infirmary, Ashton-under-Lyne, vice J. H. Armstrong, M.R.C.S.E., resigned.
W. A. HARVEY, M.B., has been appointed Medical Officer and Public Vaccinator for District No. 30 of the Langport Union, Somersetshire, and Registrar of Births, &c., for the South Petherton District of the Yeovil Union, vice W. Harvey M.R.C.S.E., deceased.
R. MILLER, L.R.C.P.Ed., has been appointed Medical Officer for the Town District of the Merthyr Tydfil Union, vice T. J. Dyke, M.R.C.S.E., resigned.

SCOTCH.

- JAMES BUCHANAN, A.M., M.B., and C.M., Glasgow, has been appointed Assistant-Physician to the Perth District Asylum, Murthly.
G. S. SMITH, L.R.C.S.Ed., late Resident Medical Officer of the Royal Hospital for Sick Children, Edinburgh, has been appointed Resident Medical Superintendent of the Cholera Hospital, Forrest-road, Edinburgh.

IRELAND.

- A. HOBSON, M.D., has been elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Broadway Dispensary District of the Wexford Union, vice P. S. Waddy, M.D., deceased.
Dr. EASTLAKE has been elected a Fellow of the King and Queen's College of Physicians, Dublin.

Vacancies.

POOR-LAW MEDICAL VACANCIES.

- Bridgwater Union Workhouse; salary £54 per annum.
Yarmouth District, Isle of Wight Union; salary £85 per annum.
Lambeth Parish, Seventh District; salary £75 per annum.
Steyning Union, Second District; area 12,641; population 2799; salary £56 per annum.
Uppingham Union, Hallaton District; area 7836; population 1174; salary £22 10s. per annum.
Wigan Union, Hindley District; area 6517; population 17,654; salary £50 per annum.
Caistor Union, Tealby District; area 14,044; population 1956; salary £24 per annum.
Cardigan Union, third district; area 38,413; population 5806; salary £40 per annum.

Christchurch Union, Eastern district; area 14,311; population 4321; salary £70 per annum.
Henley Union, Nettleden District; area 8084; population 1976; salary £80 per annum.

APPOINTMENTS.

- Calne Union.—Robert Wilmot, M.R.C.S.E., L.S.A., for the Union.
Easingwold Union.—James W. Smith, M.R.C.S.E., L.R.C.P., to the Coxwold District.
Halifax Union.—Francis E. Macaulay, M.R.C.S.E., L.S.A., to the Ovenden District.
Thirsk Union.—James W. Smith, L.R.C.P., M.R.C.S.E., to the Kilburn District.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

LONDON—BIRTHS.

- SWALLOW.—On October 19, at 61, Kennington Park-road, the wife of J. D. Swallow, M.D., of a daughter.
WORLEY.—On October 15, at New North-road, Hoxton, the wife of W. C. Worley, L.R.C.P., of a daughter.
MOULD.—On Oct. 14, at 1, Onslow-crescent, Brompton, the wife of J. T. Mould, F.R.C.S., of a daughter.
SMALL.—On Oct. 11, at 26, Colville-square, Bayswater, the wife of Dr. D. N. Small, late of her Majesty's Indian Army, of a son.
WORLEY.—On the 15th inst., at New North-road, Hoxton, the wife of W. C. Worley, L.R.C.P., of a daughter.

MARRIAGE.

- LEWIS—GREENE.—On October 20, at St. Mark's, Hamilton-terrace, F. Lewis, M.R.C.S., of 27, Dorset-place, Dorset-square, to Ellen Quarrill, stepdaughter of Henry Greene, of Greville-place, Kilburn Priory, and King William-street, London-bridge.

DEATHS.

- EVANS.—On October 22, at Gloucester-place, Portman-square, G. Evans, M.R.C.S.E. (late of H.E.I.C.S., Bengal), in his 69th year.
WARTER.—On October 20, at West Tarrington Vicarage, near Worthing, J. S. Warter, M.D. Edin., M.R.C.P. Lond., of 41, Queen Anne-street, Cavendish-square, in his 27th year.
HALT.—On October 10, at Northumberland-court, Strand, T. Halt, M.D., Inspector-General of Hospitals.

PROVINCIAL—BIRTHS.

- BULL.—On October 21, at Hereford, the wife of Dr. Bull, of a daughter.
CHALDECOTT.—On October 18, at Beomond, Chertsey, the wife of T. A. Chaldecott, M.D., of a son.
SMALE.—On October 18, at 59, Piccadilly, Manchester, the wife of H. C. Smale, L.D.S., R.C.S.E., of a son.
GOULLET.—On the 26th inst., at New Wimbledon, Surrey, the wife of Arthur Goulet, L.R.C.P.L., of a son.
LEDWARD.—On the 20th inst., at York-street, Cheetham, Manchester, the wife of R. W. Ledward, M.D., of a daughter.
BEARD.—On October 14, at 64, Grand Parade, Brighton, the wife of Dr. C. J. Beard, of a daughter.
BREAKEY.—On October 12, at Sheerness, the wife of Dr. John Breakey, R.N., of a daughter.
KING.—On October 3, at 4, Bishop's-terrace, Bridlington-quay, the wife of K. King, M.D., of a daughter.
GRIEVE.—On the 8th inst., at Howden, Yorkshire, the wife of R. Grieve, M.D., of a daughter.

MARRIAGES.

- COOKSON—LLOYD.—On October 17, at St. Mary's, Stafford, S. Cookson, M.D., to Maria, youngest daughter of E. Lloyd, of Stafford.
READ—LAWRIE.—On October 16, at Trinity Chapel, Ravensbourne Park, Lewisham, C. Read, M.R.C.S.E., of Tillingham, Essex, to Margaret, youngest daughter of James Lawrie, Esq., of 17, Rutland Park-villas, Perry-hill, Sydenham.
STILLWELL—MOREL.—On October 18, at St. Michael and All Angels', Paddington, G. J. Stillwell, M.D., of Moorcroft, Uxbridge, to Emily, eldest daughter of the late T. Morel, Esq., of Notting-hill.
ADAMS—BEADON.—On the 23rd inst., at West Monkton, Mr. J. D. Adams, M.D., of Martock, to Annabella, second daughter of Captain Beadon, R.N., of Creechbarrow, Somerset.
ALLAN—MUNRO.—On the 17th inst., at Edinburgh, Mr. A. Allan, M.D., Assistant-Surgeon, 17th Foot, to Margaret B., eldest daughter, of Mr. W. Munro, of Swordale, Ross-shire.

DEATHS.

- MUNK.—On the 22nd inst., at Finsbury-square, Florence Munk, daughter of Mr. W. Munk, M.D., F.S.A., F.R.C.P., aged 22.
HOUGHTON.—On the 18th inst., at Thornhill-villas, Radipole, near Weymouth, Mr. W. Houghton, Surgeon R.N., aged 61.
DUCHESE.—On October 22, at Brighton, R. Duchese, M.D. St. And., of Clifton Lodge, Woodford, in his 41st year.
MORGAN.—On October 28, C. R. Morgan, M.R.C.S.E., of Barnstaple, Devon.
SNOOTER.—On October 18, Charles Shooter, M.R.C.S.E., L.S.A., of Scarborough, late of Altrincham, Cheshire, aged 31.
SPARROW.—On October 19, at Dover House, Southsea, R. P. Sparrow, M.D., R.N., aged 46.
POWER.—On the 5th inst., at Maidstone, Dr. J. J. Power, aged 59.
MORGAN.—On the 28th ult., at Barnstaple, Devon, C. R. Morgan, M.R.C.S.E.
AYTON.—On September 30, at Devizes, J. Ayton, M.D.
SARGENT.—On the 21st instant, at Porchester-terrace, Hyde Park, Margaret P. Sargent, daughter of Mr. T. Sargent, aged 19 years.
SSTON-KARR.—On the 18th ult., on the river, near Calcutta, Virginia S. Seton-Karr, aged 4 months.

SMITH.—On the 20th instant, at the Parsonage, St. George's, Camberwell, Mary W., daughter of Rev. P. Smith, aged 21 years.
 WARTER.—On the 25th instant, at Queen Anne-street, Cavendish-square, London, Mr. J. S. Warter, M.D. and M.R.C.P., of West Tarring Vicarage, near Worthing, aged 26 years.
 BROWN.—On the 6th ult., at Anarkullee, Lahore, Punjab, the wife of Mr. B. Brown, M.D.

SCOTLAND—MARRIAGES.

MIDDLETON—BLAIR.—On Oct. 9, at 14, John-street, Edinburgh, J. Middleton, M.D., of Greenwich Hospital, to Janet, eldest daughter of the late John Blair, Esq., of Edinburgh.
 DICKSON—INGLIS.—On Oct. 10, at Edinburgh, Dr. Frank D. Dickson, of Buxton, Derbyshire, to Isabel Catherine, third daughter of A. Inglis, M.D., of Edinburgh.

SCOTLAND—DEATHS.

ALLAN—MUNRO.—On October 17, at Edinburgh, A. Allan, M.D., Assistant-Surgeon, 17th Regiment to Margaret Birt, eldest daughter of W. Munro, Esq., of Swordale, Ross-shire.
 WYLIE.—On October 2, at Montrose-street, Glasgow, D. R. Wylie, L.F.P. and S. Glasgow.
 HOLT.—On the 7th inst., at Glasgow, J. Holt, L.R.C.S.Ed., Surgeon R.N.

IRELAND—BIRTH.

VERDON.—October 22, at 3, Alexandra-terrace, Clontarf, the wife of Dr. Verdon, of a son.

IRELAND—DEATHS.

HUTCHINSON.—September 12th, at Jubbulpore, Central India, of fever, Coote F. Hutchinson, Esq., L.R.C.I.S., and L.K.Q.C.P.I., Staff-Assistant Surgeon 23rd Rgt. (Royal Welsh Fusiliers), youngest son of the late Wm. Hutchinson, Esq., M.D., of Carrick-on-Shannon, aged 28 years.
 QUINLAN.—On the 19th inst., at the Royal Military Hospital, Phoenix-Park, Dublin, Thomas Quinlan, M.D., Assistant-Surgeon 1st Dragoon Guards, aged 32.
 FALLON.—On the 19th inst., at Athlone, Dr. M. Fallon, aged 66.
 CARTER.—On the 28th inst., at Wellington-road, Dublin, J. C. Carter, M.D., Inspector-General of Hospitals.
 HELSE.—On the 9th inst., at Kinnitty, (King's County, Wm. Helse, M.D., aged 84.
 M'CARNEY.—October 18, at Kenmare, county Kerry, Timotheus M'Carthy, Esq., M.D., J.P.

BIRTHS and DEATHS registered and METEOROLOGY during the Week ending Saturday, October 20, 1866, in the following large Towns :—

JAMES DUDGEON AND SON, AGENTS, 113, GRAFTON-STREET.

DR. EVANS begs to submit to the notice of the Profession

"EUCALYPTUS ROSTRATA"

of Western Australia, as an Astringent in Diarrhoea, Dysentery, &c. in doses of 15 to 20 grains.

Also LOZENGES prepared from it, for Loss of Voice, &c.

CARBOLIC LOZENGE,

(Prepared from Carbolic Acid), for giving relief in Asthma and Bronchitis, as well as in the Sore Throats of Diphtheria and Scarlet Fever.

EMOLLIENT SUPPOSITORIES,

In habitual Constipation these Suppositories have been found not only serviceable but effectual in restoring the peristaltic action of the Bowels, thus obviating the necessity of continually resorting to purgatives. In Hemorrhoids they afford much relief. There are three sizes of them—

PARVA. MEDIA. MAGNA.

Aloine, Tamin, Morphia, Belladonna, can be added, if so desired by the Practitioner.

LABORATORY—49, DAWSON-STREET, DUBLIN.

J. J. Graham and Co. beg to acknow-

J. ledge with most grateful feelings the liberal and increasing patronage bestowed upon them by the Medical Profession, and to assure them that it is their constant aim to render themselves deserving of a continuance of their support.

J. J. Graham and Co. confine themselves strictly within the limits of the Pharmaceutical Profession, and under no circumstances do they take upon themselves Medical or Surgical duties, other than those performed by the Apothecary under Medical directions—namely, Cupping, Leeching, Blistering, &c.

As the value of a Prescription is completely dependent upon the therapeutic efficacy of the medicines ordered, J. J. G. and Co. are most particular in keeping up a stock of the purest Chemicals and freshest Pharmacopoeia preparations. Every article used in the making up of Prescriptions procured from the first Houses regardless of cost, and such as are at all liable to adulteration tested before use; the Profession may therefore rest satisfied that the medicines prescribed will be of the best quality, and carefully compounded under the immediate superintendence of the Principal (J. J. Graham), who resides on the Premises and devotes his whole time and attention to the management, supervising the operations of the assistants, and who is accessible at all hours.

THE MEDICAL HALL, 30, WESTMORELAND-STREET. ESTABLISHED A.D., 1821.

Cholera Disinfectants.—Carbolic Acid,

as recommended by Drs. MAPOTHER and CAMERON, and approved of by the Corporation.

In bottles of 1s. and 2s. each.

CONDY'S FLUID,
 CHLORIDE OF LIME,
 WOOD AND PEAT CHARCOAL,
 Also FRESH ANIMAL CHARCOAL,
 For Water-Filters, &c.
 BOYD AND GOODWIN,
 Chemists and Druggists,
 6, MERRION-ROW, DUBLIN.

POOLE DEFENCE FUND.

ADDITIONAL SUBSCRIPTIONS.

CHARLES ARMSTRONG, Hon. Secretary.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

AN ADDRESS,
INTRODUCTORY TO THE COURSE OF
CLINICAL INSTRUCTION

DELIVERED AT THE
RICHMOND HOSPITAL.
1st November, 1866.

By JOHN HAMILTON,
SURGEON TO THE RICHMOND HOSPITAL.

In an address, introductory to the course of Clinical Lectures to be delivered, either in this theatre, or at the bedside, it will be expected that some observations should be made as to the opportunities students will here possess of learning the most essential part of that knowledge which is to qualify them for the future practice of medicine and surgery—viz., disease and its treatment; and, also, as to the best way of studying, and turning those opportunities to advantage. The duty of the physician and surgeon in a large institution like this consists not merely in ministering to the sick; but he has another and scarcely less important vocation—viz., that of teaching his art to those who are to be the future guardians of the public health, to whom may be entrusted the lives of our soldiers and sailors, in the camp, the battle-field, or on the deep; or to carry the healing art to every part of the world—to every distant colony where the British flag floats.

How important that the teaching should be of the best; how sacred the duty to instil right principles in the mind of the student! But it is not every one that has the gift of teaching; a good physician or surgeon may yet be unable to convey the knowledge, on which his excellence depends, to others. I may be permitted to say, in all truth, we have no such incompetent teacher on our staff. It is unnecessary for me to dwell on the merits of my colleagues; their names and reputations are known far beyond the limits of these walls. All of them have been, or still are, Professors or Lecturers in universities or schools—accustomed, therefore, to the systematic instruction of youth; practised in the demonstration of the facts, and in the exposition of the theories on which the modern science of the profession rests. Full of well-arranged knowledge, abounding in experience, they will prove sure guides to the student through the devious and obscure paths which must be trod ere the desired goal is reached—skilled pilots to steer the unsteady bark of inexperience by the shoals and rocks and troubled waters of doubt and difficulty to the clear calm haven of truth. In no other profession is this more necessary. Loss of time and the results of misplaced labour invariably follow a false move in the early career of the student.

When you consider that these hospitals contain more than three hundred beds, you will understand what a field for exertion, what a treasury of facts is open to your use. But they are the materials only; to utilize them much labour will be required from yourselves. Of what avail is a large library to a man who cares not for reading? What gratification a feast of good things to one who has no appetite? What is steam but the vapour of boiling water, unless its force is concentrated and properly applied? What is a block of the whitest marble but mere stone, unless the well-directed chisel calls forth the animated bust? What the glittering treasures of the mine, unless man's labour delves deep below the surface and brings them to the light? So these three hundred beds are of little use to the idle and inattentive. What interest or value have they to them? No object in nature

or in art has any abiding interest or value unless well and closely studied. How intense becomes the interest, as the microscope unfolds the minute structure of objects to the observer, even in the meanest creature! Look at the wondrous mechanism in this anchor-like claw, to keep its hold in the flesh, of one of the minutest enemies of man, or the careful way in which these spiracles, invisible to the naked eye, are defended by bunches of hair. How precious to the anatomist that second sight which enables him to search out the very origin of structures! What reflections are excited in the mind by the last vital act revealed to us in the blood globules invariably arranging themselves into the same definite shapes. We turn our thoughts almost instinctively to the Great Artificer, whose wisdom is as wonderful to contemplate in one of those specks of creation, as in the vast fiery sun, or the rolling orbs which sparkle innumerable in the "unmeasured firmament" at night. The physicians and surgeons hope soon to afford the students at these hospitals the advantage of investigating by means of the microscope the ultimate changes which disease produces in the tissues. They expect to do this in the best manner, by having attached to their staff, as Microscopical Demonstrator of Pathology, Dr. Purser, a gentleman whose talents and indefatigable scientific research must lead him at no distant day to the highest eminence in his profession.

The two qualities most essential to form a superior physician or surgeon are observation and judgment; if to these is added invention, there is little more to desire. But invention, unless checked by judgment, is a dangerous quality, apt to lead astray, and to turn from directness and simplicity in treatment to complicated essays of doubtful novelty. I was sent for some years ago to see a case of fracture and dislocation of the ankle-joint. The accident had happened to the woman the evening before, and the leg had been put up by the surgeon who had seen her in a fracture apparatus of his own invention—a most ingenious piece of mechanism, but most complicated, with arrangements contrived to lengthen, shorten, turn in, and turn out, as required. It was too ingenious, however, to be comfortable, and she had spent a most wretched night of pain, so he and I agreed that we would try the ordinary side splints, which afforded immediate relief. You recollect, no doubt, Hogarth's delineation, in "Marriage a la mode," of a complicated machine for drawing a cork. It is, however, only against the misuse of invention that we should guard, and against overlooking the obvious and simple for the complicated. The use of well-applied invention is of inestimable value. To well-directed invention we owe the ophthalmoscope, with which Mr. Wilson takes such pains to make the students conversant; the laryngoscope, the endoscope, rendered so efficient by the improvements of my friend and former pupil, Dr. Cruise. To the same power we are indebted for Mr. Holt's valuable instrument for the treatment of stricture, and for Mr. Richardson's refrigerator for deadening the pain in superficial operations. For such really valuable inventions we have every right to be grateful.

But of observation it may be truly said, that without it no man can practise our profession with advantage to himself or to others. None can attain to eminence without a large share of it. Like other gifts, some men are endowed with a greater measure of this faculty than others. The late Sir Philip Crampton had singular powers of observation. He told me that early in his practice a gentleman of great mercantile eminence in the city consulted him for a considerable swelling of the side of the face. He had been with most of the first surgeons of that day, but all means for his relief had been unsuccessful. Sir Philip, in a bright light, carefully examined the inside of the cheek. The only thing he observed was a small white object, like a thread, sticking out. He seized this with a forceps, and drew out a small herring bone which had got fixed in the salivary duct, blocked it up, and by obstructing the flow of the saliva had caused its accumulation in the parotid gland, and the swelling of the cheek.

How many had previously overlooked this little thread? I assisted him on one occasion in tying the femoral artery. It is usual at the time of the operation for the surgeon to examine carefully the line of the artery before he cuts down on it. I observed that Sir Philip omitted this proceeding, which often has the appearance of hesitation, and that he cut down on it at once. On mentioning this to him, he told me that when he had examined the part the previous day he had observed a small mole to be situated exactly over the position of the artery. He took this as his guide at the operation, and decision and rapidity were the result. The shepherd who can distinguish each separate sheep in the flock can only do so by repeated attentive observation. When in England last summer, Lord Leonfield's huntsman showed me a very fine pack of hounds. They appeared to me an inextricable moving mass of yelping, black, brown, and white dogs. Not so to the huntsman, who called out the choicest dogs for my inspection, selecting each without the slightest difficulty from the apparently entangled mass. Careful observation enables the Indian to follow a trail, from the flattening of a leaf or the slightest derangement of a twig, which the European would be unable to perceive. This sharpened perception was not obtained without much previous labour.

Why should not you, for nobler motives, cultivate carefully this important faculty of observation, and look with keen and thoughtful eyes on the phenomena of disease, its colours, dimensions, and varied forms, so as to detect things apparently similar from those to which they are really unlike? Your object is a very high one—so to work now as to fit you for the position of one able to relieve pain, remove disease, and ward off death—to enable you to imitate, at a humble distance, the steps on earth of our Divine Master, in ministering to the sick, the poor, and the afflicted. For these sacred duties now is the time to prepare. It is indeed with pleasure I am enabled to say that we have amongst us students who have proved themselves worthy of the profession they have adopted. In the Medical Hospitals the conduct of the resident pupils has been such as to deserve the highest praise. Mr. Carroll, in the zealous discharge of his duty, contracted fever; Messrs. Clarke, Fausset, and Henry have been so indefatigable in their attendance on the poor patients affected with cholera that it is the intention of the Physicians and Surgeons to lay their exemplary conduct before the Board of Governors, requesting them to give an expression to these gentlemen of their estimation of such conduct. Mr. Henry had an attack of cholera in consequence of his exertions and communion with the patients, and Mr. Clarke and Mr. Fausset sat up three nights and days in the cholera wards, undeterred by the horror of the disease or the fear of infection, giving up the pleasures natural to their age for such sad scenes, not for reward, but solely actuated by the determination to do their duty. Who can despair for the Medical School of Ireland when we have such youths as these?

To return to the necessity of observation: In one of Mrs. Barbauld's "Evenings at Home" is a story of two boys, who took the same walk. One observed nothing and found the walk very dull; the other said he never took a pleasanter walk, for he had seen and gathered flowers, observed many kinds of birds, insects, and reptiles, their various habits, occupations, and dwellings—so many things, in short, that he was anxious to take the same walk again. The story is called "Eyes or no Eyes, or the Art of Seeing." Does not this apply to many going round our wards? They see little or nothing, and feel it very dull, no doubt. Their eyes indeed are open, but their sense is shut. But to the student who looks carefully at each case, studies its nature, watches its progress and the effect of treatment, what interest does an hospital afford? You will find that what you observe carefully will retain its place in the memory, and possess an enduring interest and utility, which lightly looked at will, like a cloud that is passed, leave no trace of its existence. Crabbe says very truly—

"It is the soul that sees; the outward eyes
Present the object, but the mind describes."

You can look at an object but not perceive it. The careless impression on the retina conveys no more an image to the mind than the picture to the canvas on which it is painted. While on the other hand thoughtful observation fills the mind with images and facts, which the judgment will arrange and deduce from, and memory fall back on, as a storehouse of valuable experience. No way is so conducive to make observation valuable as taking written notes of the cases. Every student should have a case-book; he cannot begin too early to use it. Writing down what is before you sharpens inquiry, renders it accurate, and impresses the object. Youth is the time for such studies; impressions then received remain permanently.

Among the aids which these hospitals further afford, I cannot help laying much stress on our Museum—a monument of the unwearied labour and talent of my friend and colleague, Professor Smith, to whom the advancement of pathology in this city owes so much, or our magnificent collection of plates, where the vivid pencil of our respected artist, Mr. Conolly, presents the effects of disease with the force of reality.

In studying disease at the bedside and in examining the patients, considerable restrictions are put on the pupils abroad, particularly in Prussia. With us there are no such restrictions. We trust to the gentlemanly feeling and kind-heartedness of our students, and we scarcely ever have reason to repent our confidence. To the advanced students I would recommend the utmost tenderness to the poor patients, and the most careful consideration for their feelings. Some of the diseases admitted here are necessarily fatal, such as malignant tumours or extensive injuries engaging vital organs, limbs so shattered that amputation is unavoidable. The terrible truth that a limb must be lost, or that the disease must ere long lead to a fatal conclusion, cannot be too carefully told; but to do this suddenly and without preparation falls like a heavy blow, under which the poor sufferer staggers, and there is wild lamentation and woe. The student will, therefore, see how needful it is to be reserved, and talk, as little as possible, in such severe cases, before the patient.

To the older students, who are, in fact, soon about to leave us and take their position in the ranks of the profession, with new cares and new responsibilities, I cannot appeal too strongly to prepare and train themselves for the important change. The regulation of their conduct to the sick should occupy a large share of their thoughts. The young surgeon will find in his intercourse with his patients how closely his look, his word, his manner will be regarded. It is only the experienced can tell how deeply a discouraging look, a harsh manner, or thoughtless expression sink into their minds. I should be sorry to imply that manner should be the substitute for more sterling qualities, but the want of real kindness and consideration will check the advance of the highest professional attainments.

An ever-recurring duty of the physician will be to relieve anxiety, lessen grief, and lighten terror, and to combat the baneful effects of these passions on the body. Though this is no time to enter on this subject, yet the effects of the passions of the mind on the body, in deranging its functions and producing disease, or influencing its progress, is a subject of the greatest interest, but one entirely neglected by us as teachers. Yet how powerful is this influence; how marked the changes produced by the joyous or depressing passions on the human frame! Who witnesses these passions in all their violence more frequently than the medical man?—The wild joy of the mother who receives in her arms the beloved child rescued from some dangerous accident; or the bitter, all-absorbing grief, the stunned gloomy despair of her who watches the little pale face never more to be lighted up with its former happy smile. In one case how the cheek flushes, the heart palpitates, the body glows with pleasurable excitement, and every function feels a healthful stimulus; while in the other, the depressing influence on the nervous system, particularly the sympathetic portion, enfeebles the

heart's action, and every organ feels the effect of the imperfect supply of blood, exhibited by the pale face, deranged digestion, emaciation, and muscular debility. Whether sorrow arises from the pangs of despised love, disappointed expectations, sudden losses, the death of dear friends or beloved relations, the beneficial effects are nearly the same; and the physician will be anxiously expected to sympathise with the cause and remedy its consequences.

Since the last Introductory Lecture was given in this theatre, we have lost a most distinguished member of our staff, the late Dr. Hutton. It would be impossible for any one to be more universally popular, more regarded by his friends or by his professional brethren. The reason, no doubt, was the truthfulness and purity of his mind. Perfect fairness was a marked feature in Dr. Hutton's character—he gave to every one his due; if he differed in opinion, he said so at once, and gave his reasons clearly and simply. Though gentle in manner, he was firm and decided, and having carefully made up his mind, action promptly followed. As a surgeon his knowledge was deep and extensive, and he was familiar with all home and foreign practice. As he became early attached to this institution, he brought a large experience to the consideration of any case of difficulty or emergency. As an operator he could not be surpassed—bold and rapid where required; or light, delicate, and cautious, fertile in resources, and perfectly self-possessed. So richly endowed, he yet never exhibited the least self-conceit. The loss of his valuable voice in the consultation room is deeply felt by his colleagues. Though his invention of the catgut conducting catheter for strictures, and the application of compression in cases of aneurism, prove him to have possessed the high quality of originality, yet his distaste to writing was such that his merits in this respect were not as widely known as they would have otherwise been. He had also, particularly of late years, an equal dislike to lecturing, but at the bedside his clinical observations were most valuable, the fruit of a well-stored mind and great experience. Such was the character of that pure-minded man and excellent surgeon that we have lost—but yet not altogether lost. "The good men do, lives after them." And many of his pupils here, or scattered about in many regions, still look back to his example as the guide of their conduct, and his teaching as their means of doing good. Though he is gone, the inheritance of his high professional and moral qualities yet lives, for still "The actions of the just smell sweet, and blossom in the dust."

But it is time, Gentlemen, that I should bring these observations to a close. I have told you how much you have to do, and how short the time to do it in. Work, therefore, while it is day. Let the young student now first appearing among us begin at once. The knowledge obtained here will not be the only valuable fruit of your studies. As at school, education does not consist in the mere learning grammar, or Greek, or Latin, but also in that training which habituates the mind to application, and that steady industry, which, quite as much as the information he gains, will fit the boy for the serious duties of the man: so the careful study of disease now will fit you to grapple with the difficulties and responsibilities of your future professional life. Many of you will have scarcely left this hospital when these cares and duties will begin. Every medical man is a student all his life; each case requires to be studied on its own peculiarities. The experience gained here and the habits of observation will render this study light. Dr. Swanzy, a few months ago, was a pupil here, and my resident. Directly he got his degree he went to Germany, and volunteered in the Prussian Army Medical Service, and served during the recent war, having had the care of the many sick, for cholera abounded, and the still more numerous wounded, after the battle of Königgratz and other great engagements. IN THE MEDICAL PRESS AND CIRCULAR for October 3rd is a clear and interesting account by him of the admirable arrangements of the Prussian Medical Staff for the care of

the wounded. I feel happy that one so recently a pupil should have so soon assumed such a position, and have carried the principles and practice learned here to so early and so good a use; and I am confident that the familiarity he obtained in this hospital, while resident, with every kind of accident and sudden emergency qualified him to take his place with the best of the young Prussian surgeons, and to uphold the character of the surgery of his native land. It is not too much to say that the Irish School of Medicine stands high in the opinion of the world, as a practical school especially. This high reputation is due to the labours of the great physicians and surgeons who have preceded us, and to many of those who now hold deservedly prominent positions in our city. From your ranks, Gentlemen, we look for a succession of labourers in this field of honour, and for the future maintenance of the fame of the Irish School of Medicine at home and in distant lands. When we are gone you will succeed us.

"Like leaves on trees, the race of man is found:—
Now green in air, now withering on the ground
Another race the previous race supplies—
They fall successive, and successive rise."

For future honour and success you must lay the foundation now. The few short years of your student's life will have soon passed away. If profitably passed, with what pleasure you will look back on them! How grateful the memory of well-spent days, and the consciousness of well-stored minds! I hope such feelings will be experienced by many of those I now address. As the traveller on the summit of some lofty hill feels the glow of pride and pleasure at difficulties overcome and dangers passed, and regards the rugged road he has manfully trodden, and which has brought him nearer heaven, and opened to his view the wide expanse of plains, and woods, and winding rivers, so will the contemplation of past labours be sweet—labours which have opened to your view the wide domains of science—the wondrous living frame of man, with the restless, thoughtful brain, and the busy heart, which ceaseless throbs during the allotted three score years and ten, and never knows an instant's repose—enabling you to trace out the secret ravages of disease, and those marvellous processes of repair, which assume all the characters of reason, and evince the most consummate skill.

I have often thought: that the students at an hospital resembled a regiment going to battle: At the early part of the season, as at the beginning of the march, all is eagerness to get on; nothing seen but energy and a determination to advance; after a time the timid and weak drop behind—then the idle yield to their indisposition to work and straggle away; and still farther on, the ranks are thinned by the real hardships of the way and by disease, so that at the end a small but devoted band alone remains to do battle for life and independence.

I hope, Gentlemen, that the idle stragglers, and still more, those lost to us by disease, will be few, and that we shall have many to work with us to the end. Be honest in your intentions, faithful in their fulfilment. Be true to yourselves, and true to those who have sent you here—who have made many sacrifices for you, and to whom your success in the profession you have chosen is the one cherished object of their life.

CHOLERA.

By THOMAS MEE DALDY, M.D., M.R.C.P.Eng.

(Read before the Hunterian Society, at the London Institution, October 10, 1866.)

My object, Sir, in presenting this imperfect communication to the Society is not to furnish anything novel in reference to the treatment of cholera.

On the other hand, I assume that every one here present will acknowledge that we are all anxiously in search of the appropriate treatment to be adopted in our contention with the collapsed stage of the disease.

But the success of that search must seriously depend on the track through which it is followed up, and the chief question which I would propose for your consideration is, "Have we a sequent series of data through which, by dint of persevering, step-by-step investigation, we are likely to arrive at the elucidation of this obscure disease? Or must we fall back (as we have so often been compelled to do before) on its analogy to other diseases for the pursuit of its appropriate treatment?"

In the study of the history of medicine no incident is more striking than the obstructive influence which the inappropriate use of names, or nouns intended to express a fixed series of phenomena, has exerted on its progress. The word "cholera" adds one more to the many instances in which the advancement of medical knowledge has laboured under the heavy obstacles which result from an ill-conceived nomenclature; but for that unfortunate appellative men would have been originally induced to study the disease which it is intended to designate on far wider and broader principles than a term having reference only to derangement of the biliary and chylo-poietic systems could compass. They would have been led to exert their sagacity towards the unravelling of the mysterious phenomena of the disease, not in the direction of mere chylo-poietic derangement, tethering their minds in their search after remedies to what was calculated to redress the stomachic, the biliary, or the intestinal defect; but they would have sought in, so to speak, a more catholic spirit for remedies which could be addressed to the organization as a whole; endeavouring to embrace in their inquiry that ill-understood ganglionic and sympathetic nervous system on which the unknown poisons seem to produce so direct and so powerful an influence as through it to disturb and derange the function of each organ of the body dependent upon it for its destined work, and from this class of organs can we exempt any, great or small, whose appointed duty is that of secretion?

I suspect that this subject will elude the grasp of the morbid anatomist, who will admit nothing in the elucidation of the disease but that which is palpable to the senses, or to be arrived at by a very limited deduction from what may be touched or seen. He must (cautiously, it is true,) pass into the region of the impalpable and the unseen, and appeal to the analogies which the observation of other diseases will supply to him from his daily experience.

Nor is it clear to me that the production of many of the symptoms which cholera presents by actual disease of the abdominal viscera and mechanical obstruction in the intestinal tube, so lucidly brought before the Society at its last meeting by our esteemed member, Dr. Barlow, will help us in our quest of remedies; except inasmuch as they furnish other evidence of the power which local disease also possesses of so influencing the ganglionic nervous system as to engender similar symptoms. I think that we shall best pursue our object by investigating cholera as a disease, *per se*, engendered without any apparent local cause.

The term was adopted in reference to the disease of the present century, because it presented some symptoms in common with that to which Hippocrates, Galen, Celsus, Sydenham, Heberden, Fordyce, and others had applied the term "cholera," or "cholera morbus;" but I think a careful inquiry will show that the malady which they intended to designate wanted some of the characteristic features of that with which we are now, and have been, within our own generation, striving. The first step in our inquiry should, it seems to me, be the careful consideration of its *newness* within our own time; whether within the present century we have had to contend with and attempt to unravel a form of illness unknown to our ancestors.

The year 1822 furnishes a good start-point for this investigation, because in that year Mons. Fergus summarised in the *Dictionnaire Medicale* (then in the course of publication by the leading French physicians) the current knowledge of France on this subject; and at the same

time our own highly-gifted countryman, Dr. Mason Good, also published, with his wonted care and elegance of style, an epitome of what was known in England. He not only furnished us with a digest of the knowledge and opinions of the ancient authors and those of England during the three previous centuries, but he had access to the whisperings which were then arriving from our Indian medical authorities of the army (through the kindness of Sir James M'Gregor), before and after the great outburst of the disease at the Delta of the Ganges, in the year 1817. Moreover, he had the advantage of the friendship of Sir Henry Hallford and all the leading physicians of his day, whom he scrupulously consulted on every article which he wrote in his "Study of Medicine," with which each possessed any special familiarity.

In his article (1822) Mons. Fergus adopts Galen's definition of cholera, quoted by Bianchi, "because it enunciates the special characteristics of the disease without any speculation as to its primary or proximate cause:"—"Cholera is an acute affection with frequent bilious vomitings, oft repeated alvine dejections, contraction of the limbs and coldness of the extremities, the pulse becomes more feeble and less distinct?" He admits, at the same time, that if he is to be tied down to the etymology of the word, he must include several diseases which are essentially distinct; and after enumerating the hepatic and chylo-poietic diseases which would thus be included in the term, he says—"Do we know, indeed, that these phenomena do not often depend upon some action derived from the cerebral nervous system?" He says, also, that the nosologists of the time were contending whether it was an inflammatory or nervous disease—quotes Cullen as arranging it under the head of spasms; but he especially cites Pinel (who, he remarks, has done so much towards referring all general disorders to some local affection), who recognized cholera as a fever, and denominated it "la fièvre meningo-gastrique," although many contemporary physicians, and amongst them Broussais and Geoffroy, considered it "une plegmasie gastrique."

Mason Good, at the same period, writes—"We dare not say that it is an epidemic of modern origin, since it is distinctly described by Boutius, and is supposed by some writers, though without sufficient authority, to be glanced at by several Greek physicians, and even by Celsus; but we may at least assert that it has of late years assumed an activity, fatality, and extent of range that it does not seem, from any history which has descended to us, to have possessed in earlier times. And that cannot be contemplated without horror; on which account it has been compared by Mr. Orton (Madras, 1820,) to the sweating sickness and various other pestilences that with great fury and mortality ravaged the world at former periods."

I cannot trace in the writings of Hippocrates or the ancients, nor even in those of modern authors until the present century, any account of colourless stools or suppression of urine. Mons. Fergus, when treating of cases which proved fatal in twenty-four hours, and when he designates it "une maladie funeste," speaks always of "les vomissements bilieux," and frequent alvine dejections, without any special reference to the colour of the latter.

So does Mason Good, in allusion to all previous writers, until he arrives at the history of the disease as it occurred in India, and was described by Mr. Curtis in 1807; and even then he tried to explain away the significance of a symptom which could not have escaped the notice of such acute observers as Hippocrates, or such careful inquirers as Sydenham, Fordyce, Heberden, and Cullen, if it had existed in their experience. He says—"Mr. Curtis, whose history was published in 1807, regarded it at that time as a new disease, and finding no name for it in the nosological classifications, proposed from its leading symptoms to call it 'Cholera Spasmodica;' and as a better name could not be invented, it is thus denominated in the present work." To justify the use of the term even in the face of colourless stools (for here we meet with the first glimmering of their presence), Mason Good says:—"From

the absence of yellow bile, or, perhaps, bile of any kind, by which the disorder is peculiarly distinguished, some of the writers in India have objected to the term 'cholera,' as conceiving that it necessarily imparts a redundancy of this fluid, and that, too, of its natural colour and other qualities; yet, as I have already had occasion to show that there is no such necessity whatever imposed upon the term, but merely an understanding that the bile is morbidly affected in its secretion either in quantity or quality of any kind, there is no reason for changing the term on this ground."

My object in these quotations is to show that we really have witnessed in this century a new disease: a disease differing from the Indian Mordishee, corrupted by the French into "Mort de chien;" or the disease previously denominated "Cholera or Cholera Morbus;" that it occurred sporadically, as described by Mr. Curtis in 1807; that it broke out more markedly in Bombay under the name of the Bombay fever, in the description of which it is so often asserted that they "died in the cold stage;" and that it culminated in a pestilence at the Delta of the Ganges in 1817. I wish to show that this culmination manifested itself in the most intense form of ague. I will not travel over the old ground, so familiar to us all, of its wanderings, its capricious selection of places for the exercise of its virulence, the rapidity of its destruction of life, as in the cases of sentinels found dead at their posts, the tailor at Benares dying as he sat at work, &c.; but I allude to it for the purpose of comparison with the only mode of death parallel to it. You will observe that the jungle of Jessore, in which this outbreak originated, possessed at that time, if not now, all the elements necessary to the formation of the most intense miasmatic poison. Doubtless at the deltas of the Nile, the Rhone, the Mississippi, and other rivers, cases of rapid death frequently occur at certain seasons and under certain atmospheric conditions; but the most marked parallel for our present purpose is the sudden death produced by the miasm of the Pontine marshes before people learned the great danger of quitting Rome by the Appian way in the autumn of the year. You all know that when the debris has been swept down from the Appenines into these marshes in November and December, and the unhappy combination of unusual heat and moisture lend their aid to the decomposition of the dead vegetable matter, the shepherds hasten away with their flocks, no one dare ride through the marsh even in the day-time without taking every precaution, such as closing the carriage-windows, &c., but that to do so at night is looked on as certain and sudden death.

Here, then, I think that we find an association between the most intense form of fever which we know and cholera, as regards the production of almost sudden death; or, as Mason Good expresses it, "like the effect produced on the animal frame by a stroke of lightning, a violent blow on the stomach, or any other accident that occasions instant death, by a total and immediate discharge of the vital energy."

It is necessary to view the disease (ague) from this extreme point of view, in order to acquire a type of so perplexing a malady with which we can compare the modifications of it which have passed under our notice in the four epidemics of this century. It is, surely, a new disease, of which the pathognomonic signs, as far as my research goes, were first enunciated in this country by my friends Dr. Cobb and Dr. Little, who were appointed by the Governors of the London Hospital Commissioners to inquire into its nature at the outbreak of the disease in Sunderland in the year 1831. They reported that colourless vomiting, rice-water stools, and suppression of urine were the features of the disease, distinctive from, or rather added to, those existing in what had been previously called "cholera morbus."

My friend Dr. Billing was the physician who first distinctly recognized it as ague, using, as he so wisely does, the term ague as typical of fever, whatsoever its kind; and I cannot conceive under what head it can be noso-

logically classed, unless it be that form of disease which our imperfect knowledge compels us to call "fever."

Let us start out from this point, and consider not what fever is, but the phenomena which we witness in that which we call "fever," and their similarity to the phenomena evinced in cholera. The mode of attack in either may be sudden chilliness and almost momentary prostration, or it may be *malaise* and lassitude, or, as Dr. Goodeve expresses it, "I don't know what it is, but I must knock off work." In fever we witness an abatement of the function of the secreting organs; the salivary, gastric, and intestinal glands, as well as the kidneys, secrete their several products languidly and imperfectly; the liver secretes its bile, either redundantly (as in some forms of fever) for a time, or of an altered nature, or the secretion is entirely suppressed, and the function of the brain is feebly performed, if not disordered.

In cholera the function of every secreting organ is completely arrested. The salivary, gastric, and intestinal glands give up work, for the flux from the intestines is a mere exudation from the mucous surface of the water of the blood in direct consequence of arrested circulation, carrying with it some saline matter and a small portion of the earthy salts; the liver secretes no bile, the kidneys no urine, the heart comes to a stand-still, and its right side is choked, because, although not a secreting organ, it is an actively contracting organ, and its contractile function, like the secreting function of the other organs, is arrested. The brain, however, which is neither a secreting organ (in the ordinary sense of the term), nor a contractile organ, seems to retain its integrity of function even in this living death. It is true that in some instances the brain is overwhelmed by uræmic poisoning; but these cases are exceptional. So that the analogy between cholera and fever holds good as regards all the functions of organic life, the only difference being that in what we call fever, independent of structural lesion, the functions of all the organs are interfered with, but in cholera they are absolutely arrested.

This truly does not apply to the brain, and I would use this fact as an argument in proof of the action of the poison of cholera, whatever it be, influencing mainly the ganglionic nervous system. There is no evidence that the brain is dependent upon the ganglionic nervous system for the performance of its functions at all, but it is physiologically manifest that the secreting organs are, and the reason for the involvement of the brain in ordinary fever would seem to be that it is supplied, as all the organs are, with a poisoned or devitalized blood, capable of deteriorating the working power of each organ, but not possessing an intensity sufficient to positively arrest the functions of organic life, as in cholera.

To carry the comparison on to the morbid anatomy of the disease, I need not ask you to travel with me through the lucidly minute details of Parkes and Goodeve, because the points of it which bear upon my purpose admit of being briefly summed up.

The choked right side of the heart accounts for the fullness of the great trunks of the liver, the vascular and oedematous condition of the mucous membrane of the small intestines, the prominence of the agminated, but more especially of the solitary glands, the venous congestion of the peritoneum, the ecchymoses under it as well as beneath the pleura and pericardium—these are the direct results of mechanical impediment, which impediment may also, perhaps, account for the prominence of the glandular structure of the intestine; still the latter condition bears a curious resemblance to the morbid anatomy of fever.

But the cause of this state of the right side of the heart and the frequent absence of blood in the smaller arteries of the lungs demands our more patient consideration. It has been assumed that the bloodless condition of lung (not constant, by the by), depends on spasm of the minute arteries which will not allow the blood to reach the pulmonary veins. I do not see the necessity for this assumption. In the first place, it is not in accordance with our

common observation that spasm in muscles or arterial coats should persist to the period of death. Secondly, if the influence of the poison on the ganglionic nervous system be sufficiently severe to annihilate the functions of other organs, why should not the heart, which is so dependent on its ganglia, for its contractibility be influenced in the same way? And thirdly, if it were so, the right side of the heart which is endowed with the lesser nerve supply would be the more embarrassed of the two, and allow itself to be passively distended by the inflow from the cavæ.

I fear to weary the Society, Sir, with more minute details of the morbid anatomy, but, doubtless, they will be elicited in the course of our conversation afterwards.

If we trace, in its more general aspect, the affinity between cholera and fever, we may find many instances like the following, related to me by my friend Dr. Wm. Story:—The ship *Rinaldo* left Calcutta about the 8th of May, 1865, with 500 coolies. Of these forty were affected with cholera, but the authorities would not allow them to be landed. They were compelled to sail, and in the interval between quitting Calcutta and reaching blue water they all died. From the time of reaching the blue water, however, no fresh case of cholera occurred, but almost every one of the remaining coolies was attacked with fever, and 170 of them were thrown overboard.

In more minute detail the resemblance between cholera and fever, according to a report made by the authority of the Editor of the *Lancet*, on the 1st of last September. The reporter says, in reference to a visit which he has paid to the London hospitals:—"We remarked several cases which had the roseolar rash, and some who were then in a state of complete desquamation, presenting, indeed, the appearance of convalescents from scarlatina."

I dare not venture on the abstruse question of atmospheric predisposition, but unhesitatingly assert that for many months before the outbreak of cholera in 1848, 1854, and 1866, and during its prevalence, there existed a peculiar maladive state, which was expressed by the maladive act as marked ague, remittent fever, periodic neuralgia, and the culminating act being cholera; even at this moment this may be observed by those who will take the pains to notice it.

Well, then, Sir, if we may assume, even for the sake of argument, that this analogy between fever and cholera exists, what should be our line of search for its appropriate treatment? The notion of an eliminative treatment is very tempting, because, if true, it offers an easy solution of the difficulty. We may say, from analogy, that the pustules of small-pox are a means adopted by nature for the elimination of the poison from the system; it may be so, but we do not anoint the unaffected parts with tartar-emetie ointment to produce other pustules for her aid in the elimination. We may say that the sweat of ague is eliminative, and we have all witnessed it to an extent equivalent in the quantity of fluid ejected to the flux of cholera, but we do not when we find a man's bed-clothes, feather-bed, mattress, and bed-sacking, so sodden that the fluid may drop through them on the floor; we do not give that man sudorifics to aid nature's eliminative efforts, we leave her to do her own work in her own way. Or, if we give anything, we administer quinine even in that stage for the purpose of making an impression on his ganglionic nervous system.

So in cholera I am not aware that there is any tangible ground for supposing the fluid of this passive exudation (which in a close cavity you would call dropsy) carries with it poisonous elements derived from the blood, except it be the observation in stools *passed during life*, of fine granular cells, some large, some resembling pus-cells. But there is no evidence of the quality of their contents, and it seems highly improbable that an œdematous mucous membrane could secrete from the blood an *existing poison*; more especially as a very small quantity of scaly epithelium is found. But this subject of elimination by castor oil is one to which I particularly wish to direct the attention of the Society.

I believe that we are more likely to find our remedy in those agents which will stimulate the organic nervous system to renewed action. And of these the fever remedy proposed by Dr. Billing, *i.e.*, antimony used on the contra-stimulant plan of *Rassori* and *Tommasini** with or without the addition of sulphate of magnesia, the mineral acids, chlorate of potash, quinine, bark, effervescing medicines, very often mist. rubra (or do nothing), because these are all essentially fever medicines, each to be adapted to the individual case by the sagacity of the practitioner.

The time has gone by for the search after the philosopher's stone. We must strive more and more to render the practice of physic rational.

* It is not easy to convey the idea of a contra-stimulant (or, as I would express it, "exciter of secretion"), except by an illustrative case. In March last I saw the wife of a celebrated surgeon, aged forty-six, who was after a prolonged shiver in a state similar to that which occurs in concussion of the brain. My prognosis was probable fever, and if fever, typhus. The only hope of escape seemed to me sweating, but on my visit twelve hours afterwards I found that what I can almost certainly depend upon as a sudorific had failed me; the insensibility was deepened, and when roused she saw everything red. The only remaining chance seemed to be this contra-stimulant use of tartar-emetie. She was ordered to take the one-sixteenth part of a grain every half hour until she sweated. At my visit, fifteen hours after, I learned that after the fifth dose she burst out into a profuse sweat, which had lasted five hours. I found her pulse reduced from 130 to 76, the brain condition had subsided, and from that moment my difficulty was over. She convalesced rapidly.

TREATMENT OF TYPHUS FEVER BY TEA; WITH CASES.

By THOMAS WRIGLEY GRIMSHAW, M.B.,

ONE OF THE PHYSICIANS TO CORK-STREET HOSPITAL; LECTURER ON MATERIA MEDICA IN STEEVENS' HOSPITAL.

TEA has been frequently employed in the treatment of fever, chiefly as a stimulant to rouse patients labouring under comatose conditions. Dr. Perceval, in 1818, employed tea for the purpose just mentioned. Dr. Clutterbuck, Dr. Green, and Dr. Nolan have also used it in a similar way; and Dr. Kennedy at present orders tea as an extra article of diet to his patients in Cork-street Hospital. Dr. Parkes has also recommended extract of coffee with a like object. Dr. Parkes found that doses of extract of coffee given to fever patients considerably increase the amount of urea excreted in the twenty-four hours. The experiments of Böecker and Lehmann have shown that tea and coffee tend to diminish the amount of waste of nitrogenous tissue, which at first sight seems to be a contrary result to that obtained by Dr. Parkes. The fact appears to be that tea and coffee tend not only to diminish the amount of waste of nitrogenous tissue, but also to assist the elimination of the urea already formed by the nitrogenous waste. The result of these observations by Perceval, Graves, Virchow, Parkes, and Lehmann, is that tea and coffee appear to contain many of the qualities required for the treatment of continued fever, especially typhus, the great characteristic of which is the rapid waste of nitrogenous tissue, and some of the most prominent dangers of which appear to be produced by the accumulation of effete nitrogenous particles in the blood. The stimulant properties of tea must not be overlooked when considering its use in treating fever. It might be thought that the power which tea possesses of producing wakefulness might be an objection to its use in typhus, but from this I have experienced no inconvenience, except, perhaps, in Case 24. I have not been able to ascertain any instance in which tea has been relied upon as a single remedy in the treatment of fever. I have therefore thought tea well worth a trial as a single agent, and in combination with other agents, in the treatment of fever. The following cases show the result of this treatment in thirty-one cases of typhus and one of typhoid fever:

Case 1.—Ann M.—aged 50 years; ten days ill before admission; admitted September 20th; maculated. The case followed the usual course to recovery, the spots having disappeared on September 26th. Two ounces of wine

were given on the 24th, 25th, and 26th, more to please the patient than from any expected benefit. The highest temperature was attained on the 21st and 22nd, when it reached 103° Fahr. The case was treated all through, until the temperature fell to 98, by two-ounce doses of infusion of tea every three hours.*

Case 2.—Ann McC., aged 3 years; five days ill before admission; admitted September 19th; no spots; treated with one-ounce doses of infusion of tea every three hours. The highest temperature, 102°·5, was reached on September 20th (sixth day). The patient was convalescent on September 26th.

Case 3.—Mary P., aged 15; eight days ill before admission; maculated; admitted September 7th. The spots followed their usual course until the 16th, when they had gone. The highest temperature, 104°·5, was reached on September 13th. This case, which was rather a severe one, was treated with two-ounce doses of infusion of tea every three hours; and was transferred to Dr. Mason in a state of convalescence on October 1st.

Case 4.—Bridget E., aged 30; ten days ill before admission; admitted September 10th; maculated. This case, which was complicated with bronchitis, was treated in the same way as the last, with the infusion of tea. The highest temperature was reached on September 12th (eleventh day), and the patient was convalescent on September 23rd (twenty-second day).

Case 5.—Bridget L., aged 10 years; admitted September 18th; typhus, without spots; brother and sister also had typhus. The highest temperature was reached on September 22nd (tenth day), and the patient was convalescent on September 27th (fifteenth day). The patient was treated with two-ounce doses of infusion of tea every three hours.

Case 6.—William C., aged 13 years; ten days ill before admission; admitted September 18th; no spots. The highest temperature was reached on September 20th (thirteenth day). The case was complicated with diarrhœa, which was checked by the addition of sulphuric acid and the infusion of tea, which was administered in two-ounce doses every three hours, as usual in the cases I have treated with tea. The patient was convalescent on September 24th (seventeenth day).

Case 7.—Luke B., aged 14 years; five days ill before admission; admitted September 14th, with mottling of the skin, which afterwards followed the usual course of the typhus eruption. This case was a severe one for a patient of the age, the thermometer showing the unusually (in my experience) high temperature of 105°. On September 18th (ninth day), there were head symptoms, which were relieved by leeches. The case was treated with the infusion of tea in three-ounce doses every three hours. The patient was convalescent on September 27th (eighteenth day).

Case 8.—Jas. D., aged 17 years; eight days ill before admission; maculated; admitted September 11th. The temperature in this case was not noted. The patient had an unsatisfactory convalescence by September 20th (seventeenth day), but since had a slight relapse. He was treated with the infusion of tea in the usual doses.

Case 9.—John H., aged 12 years; eight days ill before admission; admitted September 25th; maculated. This case appeared to have been ill longer than stated (eight days). He was treated with the tea infusion, and was transferred convalescent to Dr. Mason on October 1st.

Case 10.—William H., brother of the last patient, aged 14 years; eight days ill before admission; admitted September 24th; maculated. This case also appeared to be ill longer than stated (eight days). Treated with infusion of tea; convalescent on September 29th.

Case 11.—Robert McC., aged 13 years; eight days ill before admission; maculated; sister ill with typhus admitted September 18th. The highest temperature was

reached on September 21st (tenth day), and the patient was convalescent on September 28th (seventeenth day). Treatment—Infusion of tea, two ounces every three hours. Diarrhœa occurred on the twelfth day, which was checked by the addition of sulphuric acid to the tea.

Case 12.—Matthew M., aged 10 years; three days ill before admission; admitted September 10th; highest temperature, 103°, on September 13th (fifth day); convalescent, September 20th (twelfth day). No spots were seen in this case, but a faint mottling of the skin was observed on the eighth day. Treatment—Infusion of tea, one ounce every three hours.

Case 13.—Matthew D., aged 48; seven days ill before admission; admitted September 13th; maculated; son also ill with typhus. The highest temperature, 103°·5, was reached on September 15th (ninth day); and the patient was convalescent on the seventeenth day. This case was complicated with bronchitis, which required treatment by blisters to the chest, back and front. The case was treated with infusion of tea, two ounces every three hours.

Case 14.—Felix McC., aged 22; three days ill before admission; admitted August 28th; maculated. No notes of temperature were taken in this case. Convalescent on September 8th. The patient was treated with tea, except on the first two days after admission, when he was treated with nitro-muriatic acid.

Case 15.—Thos. B., aged 10 years; six days ill before admission; admitted September 1st; maculated. Highest temperature 104°, September 5th (tenth day). Convalescent on 17th day. Treatment—Infusion of tea, two ounces every three hours. This was a severe case for a boy of his age, and was complicated with bronchitis, which required the application of a blister to the chest.

Case 16.—Jane F., aged 15 years; eight days ill before admission; admitted September 12th; maculated. Highest temperature, 104°·25, on September 13th (eighth day). Convalescent on September 28th (fifteenth day). Treatment—Infusion of tea, two ounces every three hours. This case was of a very severe type, the high temperature and dense spots lasting for several days.

Case 17.—John B., aged 19; five days ill before admission; admitted September 5th; maculated. Highest temperature, 104°, was reached on sixth day, and again on the eighth. Convalescent on fourteenth day. Treatment—Infusion of tea, two ounces every four hours.

Case 18.—Mary K., aged 16; five days ill before admission; admitted September 6th; maculated. This was an ordinary and not severe case of typhus. No notes were taken of temperature. The patient was probably more than five days ill before admission, perhaps six or eight days. She was convalescent on September 10th. Treated by infusion of tea.

Case 19.—Thomas R., aged 15 years; four days ill before admission; admitted September 3rd; maculated. Highest temperature, 104°, reached on seventh day. Convalescent on fifteenth day. Treatment—Three ounces of infusion of tea every three hours. This was a very severe case, the spots being dense and dark.

Case 20.—Patrick D., aged 15 years; one day ill before admission; admitted September 13th; maculated on fifth day. Highest temperature eighth day. Convalescent on sixteenth day. This boy's father was in the same ward with typhus (see Case 12). The typhus was complicated with pneumonia on the eighth day. The case was treated with three-ounce doses of infusion of tea by the hour, until the pneumonia appeared on the eighth day (the spots also fading on the same day), when the patient was placed on a mixture containing turpentine. Convalescence took place on the sixteenth day.

Case 21.—Thomas C., aged 11; eight days ill before admission; admitted September 24th. This case was treated with infusion of tea, two ounces every three hours, and was handed on recovery to Dr. Mason, on October 1st. The case was convalescent by the 5th of October.

(To be continued.)

*The infusion of tea is made by infusing three ounces of tea in one pint of cold water for twenty-four hours.

Hospital Reports.

SPECIAL REPORT ON THE TREATMENT OF CHOLERA BY VENOUS INJECTIONS.

II. THE EPIDEMIC OF 1832.

(Continued from page 437.)

To Dr. O'Shaughnessy belongs the distinction of having first proposed to combat the collapse stage of cholera by means of venous injections, although the credit of actually carrying out the suggestion was reserved for Dr. Latta of Edinburgh. The idea of Dr. O'Shaughnessy seems to have been that the dark blood of cholera might be decarbonized by conveying to it a salt containing a large proportion of oxygen. Such a salt is chlorate of potash, and he proposed to inject a solution of this into the veins, being encouraged in his suggestion by the history of what had already been done in this way in other diseases, and of which we have already published a *resumé*. We should also add that Dr. O'Shaughnessy further proposed the use of alcohol in this manner.

Dr. Latta, when he put this idea into practice employed a solution of common salt and carbonate of soda, as representing the saline ingredients of which the blood had been deprived during the vomiting and purging, so that the theory by which he was encouraged to adopt the proceeding differed essentially from that of its proposer, Dr. O'Shaughnessy. One seems to have intended to supply the blood with *oxygen*, the other with *salines*. Be this as it may, Dr. Latta having opened a vein of a cholera patient injected large quantities of this saline fluid; for the relief given was so far beyond all his hopes that the operator was, not unnaturally, induced to continue his injection and repeat his operations, until in a few hours many pints of the solution had been introduced into the patient's circulating system. In nearly every case in which the treatment was tried the most extraordinary relief was obtained, but, alas! in too large a majority the amendment did not prove lasting. Nevertheless, five cases of profound collapse recovered out of fifteen injected by Dr. Latta—a proportion which at least warranted others in trying the plan. Nor was it long before other practitioners had other successes to record, some being rewarded with a much larger proportion of recoveries. Thus we gather that Dr. Murphy had two recoveries and one death. Dr. Tweedie had one case of recovery in four. Dr. Craigie of Edinburgh had one death and one recovery. Dr. Girdwood reported four recoveries and three deaths. Mr. Arthur of Shadwell, more successful than all, had thirteen recoveries and only five deaths.

We may here pause to remark that, in 1832, cholera was scarcely as strictly defined as now, and that the differences in the severity of the cases may possibly account for the varying success obtained. A new disease imperfectly recognized, met by a new remedy diversely applied, might naturally lead to very different results.

Dr. Little was, we believe, the first to add alcohol to the saline fluid injected. This he tried in the hope of rendering the reaction more lasting, a hope he had the pleasure of speedily realizing. The attention of this gentleman had been strongly directed to cholera by his having been appointed by the Committee of the London Hospital to accompany Dr. F. Cobbe (late senior physician to the hospital) to Newcastle, where the disease was raging violently. They remained there throughout the epidemic, actively engaged in rendering such relief as art could sup-

ply, and in their joint report (which we regret to say is now out of print) they first pointed out those essential symptoms of arrest of function, which distinguish true cholera.

On returning to London Dr. Little availed himself of the opportunity of continuing his labours presented by the outbreak in the East of London, and especially in the neighbourhood of the London Hospital—for it is a fact worthy of note that the very spots where cholera most raged in 1832, have furnished the most cases in the present year. It was in these localities, in the homes of the poor sufferers, that he first tried venous injections of saline fluids, to which a small quantity of alcohol had been added.

The success attained was not equal to that obtained by some other practitioners; but, taking into account the many disadvantages under which they were performed, we are inclined to regard these cases as most important. Dr. Little having kindly allowed us to peruse his MSS. notes, taken by the bedside at the time, we consider they form so essential a link in the chain of progress of the remedy that we have requested permission to use them. Our request having been kindly complied with, we proceed to detail the cases in the very words of the author:—

ASIATIC CHOLERA; COLLAPSE; FIVE SEPARATE SALINE VENOUS INJECTIONS DURING THE LAST TWENTY HOURS OF LIFE; TOTAL QUANTITY INJECTED 210 OUNCES; DEATH.

Case 1.—John Tennant, æt. 24, 1, New Nicholl-street, Bethnal-green, when seen by Dr. Venables, to whom I am indebted for the earlier portion of the history of the case, presented on June 15, 1832, at ten A.M., the following appearance:—"Cadaverous look; eyes sunken; slight lividity of nails of hands and feet; general coldness; great thirst and burning pain at stomach; urine absent since last night; pulse small, thready, and very weak; very copious vomiting and purging of a gruel-like matter." When I first saw him at half-past six P.M., said he was a fish-porter, lived hard, by which I suppose he meant that he fared badly; stated that his bowels were relieved once on the 13th inst., but that he had been previously subject to occasional bowel complaints. Yesterday morning he had profuse diarrhœa, followed at six p.m. by gruel-like vomitings, and at midnight by cramps. His condition has become aggravated since morning; pulse imperceptible after having been out of bed to stool, but after being some minutes recumbent, it was felt frequent and very weak; tongue and breath cold; thirst, diarrhœa, and vomiting have continued. Continue Stevens' saline treatment in use since the morning.

Quarter to ten P.M. No improvement in his condition; pulse from 104 to 110; thighs *feel* cold to the hand of the examiner, but the thermometric temperature of other parts of the body is not so low as the hand would indicate. Thus, under the tongue it is 95° F., in the axilla 93°, *meatus externus* 93°, palms of the hands 79°.

Half hour past midnight. Vomiting and diarrhœa continue; feels worse; feet of more venous hue; hands and forearms of dusky brown hue; pulse 118, a mere thread, indistinct; intense thirst; a solution of sodæ mur. ℥i.; sodæ carbon. ℥j.; potassæ chloratis, gr. vi.; water, ℥xl. was made, of which fifty ounces were cautiously injected into the basilic vein of right arm. After twenty ounces had been injected, he expressed himself better, but had more pain in abdomen. The pulse had fallen to 104, and was fuller and regular. During the continuance of the injection he complained of uneasiness in the chest, though there was no alteration of breathing. This was quickly followed by severe rigor, and he complained of cold. He vomited during the injection. It was now thought proper to discontinue the process. The pulse at this time was 98, fuller and steady; wine ℥j.

* It is worthy of remark here that Dr. Little completely anticipated the thermometric observations to which so much importance has recently been attached. —Ed. *Hospital Reports*.

An hour later—*i.e.*, half-past one A.M., Saturday, June 16th, complains of much pain in the abdomen, but says he feels quite strong; countenance very much improved; eyes less sunken, and he converses more freely; pulse remains 98, fuller. The coldness has been succeeded by a sensation of warmth; no stool since commencement of injection; pulv. opii. gr. ij, placed on the tongue.

Half-past two A.M. Has vomited slightly, so as probably to have rejected the powder.

Five A.M. Pulse only occasionally perceptible; no vomiting, but two dark dejections have been passed involuntarily; has been delirious and very restless; is universally cold; reinjection resolved upon, ingredients as before. The tube was introduced into the same vein; the operation was discontinued after twelve ounces had been introduced, in consequence of slight extravasation of fluid in cellular tissue around the vein, produced as was supposed by laceration of the vessel by the too sharp point of the injecting tube, and the friends not permitting us to open another vein. The small quantity injected benefited him; he expressed himself better, that he felt warmer; the colour of his lips improved; the pulse, also was more distinct.

Quarter to seven A.M. His friends, observing him to be sinking, allowed us to open a vein in the opposite arm; the pulse 120, very weak; in other respects as bad as ever.

Sixty-four ounces of solution containing the same ingredients as before were slowly injected, the patient during the whole time complaining of no uneasiness except on one occasion, which depended on the circumstance of the fluid being too warm (our thermometer was broken just before). The pulse fell to 90, and was full. Without further enumerating symptoms, suffice it to say, he was much improved, and felt so.

Ten A.M. Has been delirious and very restless; at present is almost insensible; lies supine, throwing his arms about. When loudly questioned, says he feels quite strong; has no pain, but points to his head. The former dusky lividity of face and lips has yielded to a bright red hue; eyes half closed and suffused; conjunctiva injected; pulse varies from 100 to 125, weak; has had no evacuations of any kind; warmth of upper part of body.

Wine, ʒj.

Six leeches to the forehead.

Noon. Pulseless and again collapsed.

Half-past two P.M. Entered the room, finding his relations weeping, himself pulseless and moribund. As a last resource proposed to inject again, which was consented to. The fluid (ingredients as before) was introduced at the left cephalic vein as at the last time to the amount of fifty-one ounces, with astonishing benefit. His pulse returned, he replied to questions, asked for drink; after a time there was a perceptible difference in the temperature of the skin. We left him without hopes of his ultimate recovery, requesting his friends to give him occasionally a small quantity of brandy and water. We returned at half-past seven P.M., found him pulseless, insensible, cold, and with more blueness than ever, indeed as marked as in any case I have seen for some time past. I was again induced to inject, not with any confident hope of success, but felt justified by the circumstance of his having been so frequently relieved by the operation, and from the belief of myself and Mr. Bennett, who assisted me, and who assiduously watched the case, that he was indebted to the injection alone for the last eighteen hours of his existence. The tube was inserted into the left media basalic, and the same kind of fluid used as before. On commencing to inject he struggled and spoke, but ere thirty to forty ounces were introduced, respiration became laboured and hurried. The operation was discontinued, and within a quarter of an hour he died. The only explanation of the struggles during the injection, if caused at all by the process, is that the fluid was too quickly introduced.

MALIGNANT CHOLERA; COLLAPSE; ONE INJECTION OF FORTY-EIGHT OUNCES ABOUT EIGHTEEN HOURS AFTER SEIZURE; SOLUTION OF SALINE INGREDIENTS USED STRONGER; DEATH THREE HOURS AFTERWARDS.

Case 2—June 17th, 1832, seven P.M., Mrs. —, aged 40, now looking 60. Her friends state that she had diarrhœa and vomiting this morning at six A.M., which have continued, with cramps at intervals, until now. She says that while alone she fainted, and with difficulty arose. Stools and vomited matters rice-water-like. Imperceptible pulse and other marked symptoms of epidemic Indian cholera present. Continue Stevens' saline treatment.

Ten P.M.: Is now almost insensible; shows few signs of life; respiration laboured; pulse at carotid 160; vomiting and diarrhœa ceased. After the injection of forty-eight ounces of the following solution:—

Sodæ muriatis ʒij.

Sodæ carb. ʒij.

Potass. chloratis gr. xiv.

Aquæ ʒlx.

The pulse was felt at the wrist (120), though previously imperceptible there.

June 18, one A.M. Pulse weak at wrist, but rapid; distinctly coupted at temporal artery 160; legs and thighs hot and moist; respiration deep, and about twenty in the minute; hands thought to be a little warmer; insensible; died twenty minutes after this note was taken.

MALIGNANT CHOLERA; COLLAPSE; INJECTION OF THIRTY-FIVE OUNCES OF SALINE FLUID AT TEMPERATURE 115° F., NINETEEN HOURS AFTER COMMENCEMENT OF THE ATTACK; SECOND INJECTION FIVE HOURS LATER; DEATH.

Case 3.—June 19th, 1832, six P.M. Edward Tanant, aged 12, complains only of excessive thirst; his mother states that at eleven P.M. last night, he was attacked with vomiting and purging, and with some pains in limbs (cramps?); the pulse has now been imperceptible two or three hours at the wrist; eyes sunken; feet inkish and colder than natural; temperature of room 78° F.; body clammy; sometimes replies to questions but with difficulty; pulse at carotid 160; after injection of thirty-five ounces at temperature F. 115, of

Sodæ muriatis, ʒj.

Sodæ carb., ʒi.

Potass. chloratis, gr. vii.

Aquæ, ʒxl.

The pulse returned at wrist 130, but although he improved during the operation, so as to express himself easier, he is now, at a quarter to seven P.M., apparently no better; the lips being very blue.

Brandy, ʒj.

Ice ad libitum.

Nine P.M. Feels better; pulse 120 at wrist, full and strong; profuse warm sweat; feet warmer; tongue moist and clean; thirst; no evacuations. Continue weak brandy and water. Since two P.M. has taken calomel gr. i., Cayenne gr. i. every hour, with half a grain of opium occasionally.

Half-past eleven P.M. Pulse about 140, weak; disposed to insensibility; no evacuations; trunk warm; perspiration ceased; face again more choleraic. Second injection of * ounces of the same solution as before. The pulse again became full and comparatively strong; he was delirious occasionally; during the injection he became brighter and lively; complained of uneasiness, which caused me to desist, after which he relapsed into a state of stupor, yet swallowed willingly some brandy and water; the pulse continuing 135, full and strong.

June 20th, two A.M. Pulse 140-50, weak; still profuse sweat; nurse reports his having had a convulsive fit;

* The number has not been filled in in the MSS. note-book.—Ed. Report.

there are now spasmodic twitchings of eye-lids and facial muscles. Died at half-past three A.M.

MALIGNANT CHOLERA; EIGHTY OUNCES SALINE INJECTION INTO VEINS ABOUT TEN HOURS AFTER OCCURRENCE OF URGENT SYMPTOMS; DEATH FOUR OR FIVE HOURS AFTERWARDS.

Case 4.—June 20th, midnight, visited—Dawson, aged 63, Bethnal-green, reported to have had diarrhoea in the morning, followed by severe symptoms at half-past one P.M. He is now in complete collapse and has been pulseless for hours; still vomits and purges; is disposed to sleep or is exhausted, lying quiet for some minutes, then suddenly calls out in a husky voice; profuse sweat, much blueness; cautiously injected 80 ounces of Dr. Lewins' solution, in proportion as he continued to revive. The improvement in him was greater than in any case previously witnessed by me. During the injection his pulse became full, his voice strong and clear; he spoke freely, and expressed himself better; the vomiting continued, and in half-an-hour afterwards again flagged in strength. Cataplasms were applied. Death at five A.M. The gentleman left in charge of the case did not repeat the injection.

MALIGNANT CHOLERA; ONE VENOUS INJECTION FIVE HOURS AFTER OCCURRENCE OF URGENT SYMPTOMS; DEATH TWO HOURS AFTERWARDS.

Case 5.—June 21st, 1832, one P.M. Saw Mrs. Day, 33, Brick-lane, reported to have had diarrhoea yesterday; urgent symptoms this morning; pulseless one hour; temperature under tongue 83°; skin clammy, no blueness; eyes sunken; injected forty ounces; pulse restored though not strong. She said she was better, but there did not appear much improvement; stimulants were freely given; again pulseless one hour and a-half after injection. Died at half-past three P.M.

CHOLERA COLLAPSE; INJECTION OF FORTY OUNCES OF SALINE FLUID EIGHT HOURS AFTER COMMENCEMENT OF URGENT SYMPTOMS; TWO HOURS LATER, SECOND INJECTION THIRTY OUNCES WITH ADDITION OF TWO DRACHMS OF ALCOHOL.

Case 6.—June 22nd, 1832, eleven A.M. Saw Mrs. Bowles, aged 35, living at 99, Brick-lane. Has had diarrhoea upwards of a week; severe symptoms set in at half-past three this morning; pulseless an hour or two; head seems clear; purging and vomiting continue; coldness, no blueness; injected forty ounces of Dr. Lewins' solution (see journals of the period); the pulse returned; she said she no longer saw double, that her head was clearer; the intense thirst continued; stimulants were freely given; cataplasms employed; immediately after the injection she had a severe rigor and appeared moribund.

Half-past one P.M. Rigor has ceased; pulse continues, although weak; skin feels somewhat warmer; slight diarrhoea. Ordered copious warm gruel enema with salt, brandy in effervescing mixture.

Half-past two P.M. Pulse extinct; has been complaining of intense oppression and pain at the chest, afterwards of pain in the loins; breathing 60 in the minute; sinking fast. Injected thirty ounces of same fluid as before, with the addition of two drachms of alcohol; the pulse returned full and strong, and she appeared intoxicated. This improvement continued only a short time. Death at three-quarters to four P.M.

In furnishing the writer of this report with the above extracts from his note-book of 1832, Dr. Little remarked that reperusal of these old notes reminded him that he assisted at injection of salines in one case in Ratcliffe or Shadwell, which recovered. He also assisted at injection of another case (fatal) in Aldgate, one of the ingredients used being quinine. He mentioned these cases, because in former publications he had spoken of having injected, or having assisted to inject, only six cases altogether in 1832, six cases only being recorded in his own note-book of that period.

ADELAIDE HOSPITAL, DUBLIN.

STRICTURE OF THE URETHRA.

FORCED DILATATION; NO BLOOD LOST; MARKED IMPROVEMENT.

(Under the care of Mr. B. WILLS RICHARDSON.)

Mr. RICHARDSON stated that before he made any observations on the case, he would first read the report of it by Mr. Alexander Duke:—

"J. J—, aged 44, a private tutor, was admitted into the Adelaide Hospital on the 12th of July, 1866, to be treated for stricture of the urethra, and vesical irritation apparently consequent thereon.

"He mentioned that he contracted gonorrhœa about seven years ago, which he allowed to run its own course. Two years after the first appearance of the discharge, the stream of urine commenced perceptibly to diminish in calibre, and he began to suffer from irritability of bladder, with incontinence of urine. The latter symptoms became aggravated six or eight months before his admission into hospital, and the stream of urine was reduced to a very small size.

"After he had been in the hospital a few days, and had taken some warm baths, Mr. Richardson made an exploratory examination of the urethra, and ascertained that the canal was very much narrowed in two situations—(1) about a couple of inches from the orifice, and (2) at the bulb. Both the strictures seemed to be of an obstinate and intractable nature, for the process of dilating them with the bougie up to No. 4 size of Weiss' gauge was rather tedious, so much so that Mr. Richardson determined to stretch them according to Luxmoor's principle—i.e., by forcible dilatation. This method of treatment having been explained to the patient, he, after a little hesitation, wished it should be tried."

The instrument I used in this case was not Perrève's, so frequently and so successfully employed by Mr. Holt, and now so familiar to the profession, but the instrument of Lyons, in which the two steel blades or bars are separated by means of a screw, and not by the conical forcer, as in Mr. Holt's urethral dilator. Mr. Henry Thompson uses an instrument somewhat similar to that of Lyons', and which has some advantages over it, particularly when there is but one stricture in the canal.

In Mr. Thompson's instrument, the blades are united throughout four inches of the shaft, and, as in Lyons' dilator, by turning a handle containing a screw, are slowly and gradually made to diverge at a given spot, "forming a spindle-shaped figure three

Lyons' Dilator (Lüer).

or four inches in length, and a third or half an inch in diameter." This instrument being constructed to allow the blades only to separate to the distance just mentioned, I do not consider so suitable when there are more strictures than one, and therefore I used Lyons' dilator, the blades of which can be divaricated nearly their whole length. The patient having two strictures some distance from each other, both could, at the same time, be forcibly stretched with Lyons' instrument, and I therefore preferred using it.

The stretching of strictures with the screw dilator requiring some minutes for its performance, chloroform ought to be used. It was suggested to the patient, but he declined it.

The intention in slowly separating the blades of the dilator is, as Mr. Thompson expresses it, "to overstretch the morbid tissues as much, and to rupture them as little as possible, in order to destroy, or, at all events, to greatly impair the natural tendency of the stricture to contract."

The after-treatment of this case differed from Mr. Thompson's in respect to the introduction of the catheter after the distension was effected. I postponed doing so until four days after the operation, when Nos. 8, 10, and 12 bougies could be passed with facility. A larger bougie than No. 12 was not used, as the patient has naturally a narrow urethra. Metallic bougie No. 12 was passed from time to time, and on the last occasion, a fortnight intervened between it and the previous passing of the instrument, when it was found that no recontraction had taken place, which was most satisfactory, considering that the prior treatment of the patient by vital dilatation had been wholly unsuccessful, the strictures becoming in a few hours after the passing of the bougie as narrow as they had been before it.

Lyons' dilator is one, comparatively speaking, easy of introduction, and may be made of very small size, and, with ordinary care, to work without risk of breaking. I have one of the smaller sized screw dilators, also of Luër's make, the size of which at the point is only a full No. 1 of Weiss' gauge, and less than this for two inches backwards, when it gradually increases to No. 3 of same gauge, which size it maintains to the handle.

I do not wish it to be understood that I advocate forcible dilatation to the exclusion of other methods of treating urethral narrowing. I, however, think it should be conceded that forcible dilatation is a valuable auxiliary in certain obstinate cases of stricture, which, from their resistance to dilatation by the vital process, render the latter exceedingly tedious, and particularly in strictures situated in the anterior portion of the urethra. Moreover, as far as this case goes, it supports the opinion that forcible dilatation diminishes the tendency of stricture to recontraction.

Reviews.

THE MEDICAL OFFICER'S VADE MECUM, or POOR-LAW SURGEON'S GUIDE: containing the Regulations at present in force relating to the Relief of the Poor in Sickness, and the Appointment, Qualifications, Duties, and Remuneration of Union Medical Officers in England and Wales: with a note on Vaccination and Public Vaccinators. To which is added an Appendix, containing, *inter alia*, all the "Medical Acts;" also a copious Index. By NUGENT CHARLES WALSH, Esq., of the Poor-law Board, Barrister-at-Law. Pp. 196. London: Renshaw. 1866.

The above title-page is so copious that we are relieved from the necessity of indicating the different heads under which Mr. Walsh has arranged the materials of this very useful manual, and an analysis on our part is the less called for, as many if not most of the subjects introduced have been frequently discussed in our pages. Too many of our readers, also, have been made acquainted, by painful experience as

Poor-law Medical Officers, with the numerous and often vexatious Rules, Orders, and Regulations of the Poor-law Board, and have, no doubt, wished most heartily that many of them were abolished altogether. Still, there are many members of our profession entering upon the thorny duties of Poor-law Surgeons, and others already occupying that position, to whom Mr. Walsh's book will be very acceptable, as containing a great amount of information which is actually necessary for their guidance, and a perusal of his pages may perhaps save many of them from falling into mistakes on legal and technical points. Mr. Walsh's style is clear and precise, and the various duties and responsibilities of the Poor-law Medical Officers are so definitely laid down that they can hardly go wrong if they trust themselves to his guidance.

THE POPULAR SCIENCE REVIEW. Edited by HENRY LAWSON, M.D. October, 1866. London: Hardwicke.

The present number of this excellent periodical contains, as its frontispiece, a photographic engraving of Baron Liebig, and the letter-press embraces contributions from many distinguished cultivators of Natural Science. An article which will be extensively read, as referring to a recent memorable achievement, is that on the Electric Principles of the Atlantic Telegraph, in which the writer, Professor G. C. Foster, of University College, London, explains in popular language, and illustrates by well-executed engravings, the mechanism of the wire which now connects the two worlds, and the theory by which its operation is explained. But there are many other articles of great merit, among which is one on the Movements of the Diatomaceæ, by E. Ray Lankester; one on the Bone Caverns of Gibraltar, Malta, and Sicily, by Mr. A. L. Adams, and one on Modern Views of Denudation, by Mr. E. Hull. The number contains also a series of reviews, and a scientific summary of recent discoveries and theories, and the whole of the contents fully maintain the high reputation which the journal has acquired.

CHART OF MEDICINAL PREPARATIONS. Compiled by H. MACNAUGHTEN JONES, M.D.

A VERY useful chart for every Medical man—Doctor, Apothecary, or Student. It gives, in a simple form, the strength, composition, and dose of every preparation in the Pharmacopœia. If Dr. Jones will add to his next edition a short note of the incompatibles of each preparation, it will be complete.

MEMOIR OF SIR PATRICK DUN (Knt.), M.D., M.P., Physician-General to the Army, and some time President of the College of Physicians; including his Will, his Deed for constituting a Professor of Physic; and other important Records concerning the Profession of Physic in Ireland, never before published. By T. W. BELCHER, M.D., Dublin; B.M. and M.A., Oxon and Dublin; Fellow, Censor, Examiner, and Hon. Librarian, King and Queen's College of Physicians in Ireland, &c. Second Edition. Revised and Enlarged. Printed and Published by authority of the College. Dublin: Hodges, Smith, and Co. 1866. 8vo. Pp. 80.

In the Memoir above described, we gladly hail another important contribution, from the able pen of Dr. Belcher, to the history of the Medical Profession in Ireland. As the author himself observes, the present essay may be looked upon as continuing the history of the College of Physicians from the death of its founder, Dr. Stearne, to the present time. Most of our readers are, no doubt, familiar with the record of the life and times of the last-named philanthropist, for which also we are indebted to Dr. Belcher's untiring zeal and industry, and to which the present work may be considered as a sequel. We rejoice, too, that

a more extended notice than those previously published by Prof. Osborne and Sir Wm. Wilde, of a distinguished physician, to whom the medical profession and the cause of medical education in Ireland are so deeply indebted, has now seen the light. This notice contains "several original and important public documents not hitherto printed, as well as private letters of Sir Patrick and Lady Dun, and other interesting matters."

"The subject of the present memoir was born in Aberdeen in January, 1642. His father, Charles Dun, (itser (or dyer), was a burgess of Aberdeen, and Patrick was his second son by his second wife, Katherine Burnet. This branch of the family of Dun had been then long settled in Aberdeen, and belonged to the ancient stock of Dun of Dun, or of that ilk, near Montrose. Charles Dun was one of the nephews of Dr. Patrick Dun, Principal of Marischal College, and the munificent endower of Aberdeen Grammar School, where his name is to this day held in great respect; and where his portrait (by Jamieson), presented by his representative, Archdeacon Bisset, may be seen."—P. 15.

The early part of Dun's life seems to be buried in obscurity; the first notice of him occurring in a letter written from Dublin Castle by Sir John Hill in 1676, in which he is spoken of as "one Dr. Dun, an Aberdeensman, who is Physician to the State and to my Lord Lieut." Within a year or two from the date of the letter referred to, he was chosen a Fellow, and on the 24th of June, 1681, he was for the first time elected President of the College of Physicians, which office he continued to hold, as it would seem, until St. Luke's Day (18th October), 1687. To the same position he was re-elected in 1690, 1691, and 1692, and on 15th December in the last-mentioned year, he was nominated the first President under the charter of William and Mary, being also re-elected in 1693, 1696, 1698, and 1706. From the Catalogue of Oxford Graduates, 1772, it would appear that Dun was a graduate of Dublin, and incorporated thence with Oxford. In 1692 he entered the Irish House of Commons, having been elected both for the Manor of Mullingar, in the county of Westmeath, and for the borough of Killileagh, in the county of Down. He elected to sit for the latter, and was again chosen member for Mullingar in 1695 and 1703. In 1696 he was knighted by the Lords Justices of Ireland; and on the 25th of March, 1705, he was appointed Physician-General of the Army.

We have thus briefly indicated a career full of success, and it is pleasing to reflect that the fortunate recipient of so much good was not ungrateful to the land of his adoption, to which he owed his prosperity. The splendid hospital which is called by his name, and the Professorship of Physic founded by him, remain as lasting memorials of his philanthropy, his liberality, his love of his profession, and his enlightened views. The funds bequeathed by him have provided alike for the wants of the poor, in their hour of special trial and of sickness, and for the education of the young aspirants to the professional success he had himself attained.

Dr. Belcher has done well in aiding to spread more widely the memory of so distinguished a member of our profession and such a single-minded benefactor of his race; and to his essay we must refer our readers for many interesting details and valuable historical documents connected with the brilliant and exemplary career of Sir Patrick Dun.

CHILDREN'S HOSPITAL AT BRISTOL.—A new Hospital for Sick Children and the Outdoor Treatment of Women has been inaugurated at Bristol. The following form the Medical Staff:—Drs. J. Symonds and J. Beddoe (Consulting Physicians); Messrs. Chas. Greig and W. Ormerod (Consulting Surgeons); Dr. W. G. Carter (Physician); Messrs. T. G. L'Enardi Baretti, C. Steele, and Dr. E. Williams (Surgeons). The Resident Medical Officer is Mr. H. T. Hetling. A building known as Fort-house, Royal Fort, St. Michael's-hill, formerly the residence of Reynolds, the philanthropist, has been purchased and converted to the use of the institution at a cost of upwards of £1200.

London Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 7, 1866.

A PROSECUTION UNDER THE MEDICAL ACT.

A FEW days ago a case was tried at the Police Court in Greenwich presenting some very great points of interest to the Medical Profession, although the particulars occupy only a rather obscure corner in the columns of the leading English journal, the *Times*.

It appears that a Mr. DENNY, of Rotherhithe, has been falsely representing himself to be, and practising, as a Surgeon, thus rendering himself liable to a fine of £20. The case was very distinctly proved, the defendant having announced himself as a Surgeon on his door-plate, and having actually attended patients and received payment for his attendance. He even went so far as to propose to Mr. MURDOCH, a qualified member of the Profession residing in the same locality, that the latter should make a post-mortem examination, for a Coroner's inquest, of one of DENNY's patients, and that the two *should divide the fee*, DENNY being, of course, unable to appear in the Coroner's Court as a witness. This proposition was at once, and very properly, declined by Mr. MURDOCH, who told DENNY that he would have nothing to do with him.

The defence offered was of the most feeble kind, and turned out unsuccessful. It was to the effect that DENNY was at present attending the lectures at the Middlesex Hospital, and had taken up all but one degree to enable him to practise as a surgeon. Whether this story be true or not, we know not; nor is its truth or falsehood of much consequence, for it obviously does not affect the merits of the case. The magistrate remarked that the defendant had for the last twelve months at least falsely represented himself to be, and had practised as a regularly qualified surgeon, and he therefore inflicted upon him the penalty of £10, with costs. On hearing this decision, we are told in the report that the defendant became much excited, and ventured upon the very improper remark that the effect of the decision would be to make him sell his business to a chemist, or to some other unqualified person, *who would also put forth a plate describing himself as a surgeon*.

Now, this case is not only important in itself, but the evidence adduced points to a great and grievous evil, which is daily and hourly suffered to exist among us, and which is doing extensive mischief, not only to the Profession but to the public. On the one hand, the legally qualified members of our body are unfairly deprived of their legitimate gains by the practice of impudent pretenders; and on the other hand the public, and especially the lower classes, are exposed to the danger of having their health injured and their pockets drained

by persons pretending to be what they are not. The defects of the Medical Act are well known to our readers, and it is scarcely necessary to point out that it was only by the most utter folly and recklessness that the defendant, in the above case, exposed himself to the penalty which was inflicted upon him. The fact seems to be that, in consequence of the immunity so long enjoyed by the quacks and pretenders to medical knowledge, in spite of the provisions of the Medical Act, these gentry have presumed too much upon the forbearance of the Profession and the sluggishness of the law, and have at length boldly thrown off disguise, and, as it were, have defied public and professional opinion.

Offenders of Mr. DENNY's class are unfortunately very numerous at the present day, but they manage their plans so ingeniously as to escape their well-merited punishment. Not only are there very great difficulties of a technical nature to overcome before a conviction can be obtained, even in some of the clearest cases, but the onus of prosecuting the offenders is very unfairly laid upon the members of the Medical Profession, or upon some other private individual, instead of being entrusted to a public prosecutor. In this respect the Government of the country exhibits a culpable neglect of its obvious duty, although it is energetic enough in instituting prosecutions where the rights or emoluments of the several departments at the head of the State are concerned. Suppose that a person, however respectable in other points, were to sell spirits or tobacco without a license, he would be very soon dealt with by the laws of the country; but impostors and pretenders are allowed to ply their unrighteous calling as sham doctors with almost perfect immunity; for, although a law exists for the suppression of this unrighteous traffic, there is no public functionary to put it into execution, and what is worse, there are lawyers and even judges who, instead of looking at the obvious meaning of the statute, exert their ingenuity in enabling delinquents to evade its provisions.

A conviction, however, has now been obtained, and, in the absence of a public prosecutor, we think that Mr. ROGERS and Mr. MURDOCH, surgeons, of Rotherhithe, are entitled to the gratitude of the Medical Profession for instituting the recent prosecution, and we hope that in other districts the same activity may be shown in proving that the Medical Act is not a dead letter. There are plenty of persons now practising illegally who richly deserve the same fate as that which has befallen Mr. DENNY, and we hope that they may be exposed and punished.

THE SCHOOL OF PHYSIC IN IRELAND.—II.

IN our last number we furnished our readers with a summary of the history of the School of Physic Act, and we concluded our observations with remarks on the Hospital of Sir PATRICK DUN, which was completed in 1814. For six years before that time, however, a

small portion of the edifice had been used for clinical purposes on what we should now consider a very mild scale. It was fully developed as a complete medical institution in 1814, and reformed as a Medico-Chirurgical Hospital in 1865.

We have already noticed the three University Professorships which belong to the School of Physic. These were originally Lectureships; in 1785 they became Professorships by Act of Parliament; and such is their legal status at present. The Professor of Anatomy and Chirurgery has, however, for a long time back given up lecturing on Surgery, and this part of the duty has been performed by a separate Professor of Surgery, whose office was instituted by the Board of Trinity College a few years ago. The old office of University Anatomist has also been restored, and his duties may be best described as those of the Senior Demonstrator and Anatomical Lecturer in other schools. It is not our object to introduce personal details into this article; but we cannot refrain from saying that the Professors chosen by the Board of Trinity College have almost invariably been the right men, and therefore their choice has generally met with the full approval of the profession. These Professors, with those on DUN's foundation, are chosen for seven years, but it is usual to re-elect them at the close of each septennial period, so that their offices are virtually tenable for life. At present there is one vacancy—viz., in the Professorship of Botany; and it is of great moment to the well-being of the School of Physic that the future Professor should be a competent clinical teacher, as we hope afterwards to show. On one occasion a gentleman, who was not a medical man by profession, but who was a first-rate botanist, was chosen for this office. The School of Physic Act required that he should be a Doctor in Physic; and this difficulty was overcome by giving him an honorary degree to enable him to compete for the place. Of course this was a mere evasion of the law; the Professor so elected never gave Clinical Lectures, as he was bound to do by Statute, for the best of reasons, because he was not able; and, therefore, he really did not discharge the full duties required of the Professor of Botany by the School of Physic Act. To repeat a blunder of this kind now would prove of serious consequence; for, since the passing of the Medical Act in 1859, any one holding the degree of Doctor of Medicine from a body recognized by the Statute, can be registered and act as a Medical Practitioner. Thus the exercise of the power of granting honorary degrees in medicine becomes of vital consequence to the public; for if such a case as that to which we refer were to occur again—as indeed it did the other day in another University than that of Dublin—a man who has had no medical education at all, but who may be a chemist, or a botanist, or a naturalist, may become an honorary graduate in medicine, and be let loose to practise physic among her Majesty's subjects, or to give medical evidence in her Majesty's Courts of Law.

The other three Professors of the School of Physic appointed by the Statute of Parliament are those of the Institutes of Medicine, of the Practice of Medicine, and of *Materia Medica* and Pharmacy. The mode of election of these officers is curious. The College of Physicians elect, always from their own body, three "Electors," who, with the Regius Professor of Physic in the University of Dublin and the Provost of Trinity College, form the five Electors of the King's Professors. This arrangement leaves the appointment with the College of Physicians, because their three Electors, who form the majority, always vote together; so that the real election is on the question—Who shall be the three Electors?

These Professors are required to give Clinical Lectures in Sir P. DUN'S Hospital, and should any of them be a Fellow of the College of Physicians—and it never has happened otherwise—he vacates his Fellowship by the fact of his election to the Professorship. The same occurs on the election of a Fellow of the College of Physicians to a University Professorship; and these latter Professors also are *ex-officio* Clinical Lecturers at the Hospital.

The College of Physicians has added to the statutable professorships two others:—those of Midwifery, and of Medical Jurisprudence. Neither enjoys any of the funds of DUN'S estates; but as soon as the Hospital can support 100 patients the Professorship of Midwifery becomes a King's Professorship on the same footing as the others. The College of Physicians are trustees not only for the King's Professors, and for the Clinical Hospital, but also for the interest of the Professor of Midwifery, for DUN'S Library, and for other matters to which the surplus funds may be, and in some cases are, applied in accordance with the Statute. As DUN'S Hospital has more than once supported 100 patients, it becomes a nice legal question as to the interests of the Professor of Midwifery; for the Act does not require that the 100 patients should constantly be supported, or that this should be done wholly out of the trust-estates.

The excellencies of the professional system of the School of Physic are, that under it the public have the best possible guarantees for the election and perpetuation of good teachers; that by the income of the Professors consisting partly of fixed salaries, and partly of fees variable with their excellence as teachers, men of standing can be found to take the chairs, and yet when they do take them they have every motive for keeping abreast of the tide of Medical Science. These excellencies are, however, accompanied by drawbacks. Among such may be noted the compulsory vacating of Fellowships on election to the King's or University Professorships.

In the case of the King's Professors this operates on the theory that it would not be equitable to have men who are trustees of the estates at the same time deriving income from them, and voting on the disposal of the money. But this is mere theory; for, as the salaries are fixed by Act of Parliament, no more could be given to any one than his legal right; and as to exercis-

ing influence, by voting or otherwise, the College of Physicians has always ranked its professorial *ex-Fellows* among themselves, just as if they had the right of voting; and inasmuch as these Professors are chosen from among the most influential of the Fellows, it is plain that they retain their influence in the College for all practical purposes, although they cease to be chartered members of it. University Professors lose their Fellowships just that they may be at equal disadvantage with those on DUN'S foundation; and here it is more of the nature of a grievance, because they derive no income from DUN'S estates. Another anomaly is, that Professors who may be Fellows of the College of Surgeons continue to hold their Fellowships. This is as it should be; but the enactment about the College of Physicians' Fellowships ought to be repealed. The idea of the Act was that the King's and University Professors should be on equal terms; and as the latter enjoy respectable fixed salaries, in lieu of which they lecture all students in arts gratis, receiving fees from all others; so the salaries of DUN'S Professors ought to be raised to the amount enjoyed by their University brethren, they lecturing students in arts as the University Professors do. This would be not only just, but equitable, and would serve to atone for some of the injustice done to DUN'S Professors by the School of Physic Act, which confiscated most of their property. Except in the cases of the Professors of Institutes, and Practice of Medicine, and Surgery, clinical teaching should be made separable from the duties of the other Professorships; and where the holders of these latter were unfit, or unwilling, to perform clinical duties, provision should be made for their performance by one or more Clinical Professors specially chosen for the purpose.

It may be, perhaps, objected to reforms of this kind that the School of Physic Act should not be touched, lest the whole system created by it should tumble down. To this, however, it may be replied that it already has been touched by subsequent legislation, and in important particulars too. The clause restricting the College of Physicians from granting leases for more than thirty years has been repealed in part, and they now may, and do, give leases for sixty years, under certain circumstances. Again, the statutable qualifications for Fellowship provided by this Act have been repealed in the present reign; and when it is considered that the entire was drawn up, it is said, by Provost ELLINGTON, afterwards Bishop of Ferns, and Dr. ROBERT PERCEVAL, neither great legal authorities, we shall not be surprised to find that various clauses of it are open to diverse interpretation, and that the whole is based on an incorrect title of a former Act, which it professes to repeal, but which, according to some, is not repealed at all. We refer to those clauses which profess to repeal most of an Act said therein to have been passed in the 21st year of GEO. II., but which really was passed in the fifteenth year of that King. The clauses regarding the maintenance and government of DUN'S Hospital are also

open to controversy; but as we purpose to discuss the Clinical Department of the School of Physic in a future article, we shall reserve our remarks on this part of the Act for that occasion.

CHOLERA.

"A NEW outbreak of cholera at Woolwich." That is the most serious item in our weekly summary of the progress of the epidemic. But for this we should have had to chronicle the most remarkable diminution that has yet occurred in any one week. In the forty-third week of the year, 112 deaths were registered from cholera, and 32 from diarrhœa, giving a total of 144 from both forms of disease, as against 199 in the week preceding. But out of the 112 deaths from cholera no less than 30 occurred in the Woolwich Dock-yard, and the Plumstead sub-districts near the southern out-fall sewer. About the marshy districts of Plumstead, where many cases have occurred, the houses are surrounded by tidal ditches, which not unfrequently find access to the basements of those built at the lowest levels. There were no less than 10 deaths from cholera in Woolwich on the 26th of October. We may here repeat a fact to which we have more than once drawn attention—that Woolwich alone, of all the metropolitan districts, appointed no special Health Officer before cholera became epidemic. The cases that are described by the Medical Officer of Kidbrooke and Charlton were of a severe and rapidly fatal type—the duration being from eight to sixteen hours. Surely it is time the inhabitants insisted on their local authorities taking up the matter in earnest. On the 26th ult. we find out of 22 deaths registered from cholera, no less than 16 took place in the Southern districts, besides 3 from diarrhœa, out of a total of 6 for all London. On the following Monday only 15 deaths from cholera took place in all London, but 12 of these were in the Southern districts, which further had 2 deaths from diarrhœa, out of 5 in the whole metropolis. It is sad, and even alarming, for one district thus to have the power of becoming a new focus of the epidemic, and if the local authorities are indisposed to cope with the emergency, the safety of the kingdom requires that their powers should be transferred to others more competent to wield them.

The annual rate of mortality for the week has been 24 per 1000 in London, 29 in Edinburgh, and 41 in Dublin. At the Royal Observatory, Greenwich, the mean height of the barometer was 29.791 inches. The mean temperature of the air 49.1, which was 0.9 deg. above the average. The mean degree of humidity was 90. The total rain-fall amounted to 1.13 inches.

THE THAMES.

Four cases have been admitted on the *Bellisle* from a brig moored near the Victoria Dock and which had had no communication with Woolwich. No cause has been assigned, though the water (obtained from Plymouth) is suspected.

EDINBURGH.

Out of the first cases received in hospital, as reported in our last, 17 had occurred during the week. Of the 50 cases, 34 had proved fatal, and 11 had recovered, 5 remaining in hospital. In Leith there had been a considerable diminution during the week. In Slateford, a village two miles west of Edinburgh, 12 fatal cases had occurred within six days, all the victims, with one exception, having

resided in one tenement supplied with water from a well which had become affected by percolations from the adjoining stream of the Water of Leith. A coal merchant, his wife and child, his brother and two of his carters, have all died. An hospital had been opened in the village hall under the care of Dr. Balfour, who on hearing of the outbreak hastened to give his services, and Lord Dunfermline had been almost a daily visitor to the hospital. There had only been two recoveries—two cases remaining under treatment at last report. Bonfires were lit in the affected parts of the village for the purpose of agitating and disinfecting the air. Since then there has been a decline in the number of cases. In Musselburgh, and particularly in the Fishherrow section of the town, the epidemic has been very severe, no fewer than 42 cases of cholera and diarrhœa having been reported, with a fatal result in 20 cases. In the fishing village of Buckhaven, on the south coast of Fifeshire, there have been 28 deaths, and on Sunday 12 cases were under treatment. Many of the inhabitants had fled from the presence of the deadly visitor. In a considerable number of the villages of the Lothians and Fifeshire the epidemic has appeared during the autumn, but in no case has its presence been of long duration in Scotland; the disease has hitherto appeared mainly on the east coast.

DUNDEE.

Two cases of Asiatic cholera have been reported in Dundee, and in the large manufacturing village of Lochee, immediately adjoining the town, there has been a terrible outbreak of the epidemic. From Friday to Monday there were 19 deaths from cholera and its attendant diseases. A house-to-house visitation is being made, and every available precaution adopted. At Brechin four deaths from Asiatic cholera were reported during the last week, and the dreaded malady is said to have also appeared in the town of Forfar.

THE NORTH.

Time has only confirmed the supposition that the outbreak at North Shields was due to contaminated water. The cutting off the supply of the suspected water was at once followed by a diminution in the number and fatality of the cases. Yet, within a fortnight, some 100 persons have perished. There are also constantly reported cases in the towns on the Tyne, the Wear, and the Tees. At West Hartlepool, for the last two or three months, occasional cases have occurred, in some instances several members of a family being swept off. On Thursday evening the death of a mother followed close upon that of her son, and hers was the seventh fatal case of cholera which had occurred within a radius of not more than twenty yards. In the previous week there were fatal cases at Seaton Carew, a fashionable village watering place near Hartlepool. Stockton has been visited with several fatal cases. One or two deaths have occurred at Middlesborough. At Darlington there was a case, though it was clearly imported from Shields, in which the wife of a leading tradesman succumbed to the disease. Two other fatal cases had previously been imported into the town from West Hartlepool by persons who had gone to attend on relatives seized with the disease. The disease has never been so capricious in any former outbreak. Within the last three months a town or village has been visited with one or two malignant cases, and nothing more has been heard of the disease for some weeks, when more

isolated attacks recur. Outbreaks occur in places which have always been regarded as having a special immunity from cholera—small agricultural towns and villages. Last week there was a fatal case at Yarm, a small agricultural town in the North Riding, not far from Darlington, and the previous week there had been three fatal cases. Five deaths have occurred at Aiskew, a small village between Richmond and Ripon. At Wolviston, a village in Durham, within the Stockton Union, there have been about twenty deaths from the disease.

Notes on Current Topics.

THE ACQUITTAL OF RISK ALLAH BEY.

RISK ALLAH BEY, who has just been acquitted in Belgium of the charge of murder, is a member of the medical profession. He is a native of Lebanon, and when a young man he came to England and studied medicine, and obtained the diploma of the College of Surgeons of England. In the Crimean war he served in the Turkish army, and when peace was declared he returned to England as Medical Attaché to the Ottoman Embassy, having received from the Sultan the order of the Medjidie and the title of Bey. In 1857 he married a widow with a fortune of £25,000, who died soon afterwards, leaving him £20,000, and the remaining £5000 to a young man, named George Readley, of whose murder Risk Allah was accused. This youth passed as the nephew of the widow, but it is stated that he was her natural son. As he was under age when his mother died, he was made the ward of Risk Allah, and in March, 1865, when he was very nearly 21, he and his guardian were staying at an hotel in Antwerp, and one morning he was found dead in his bed, with a loaded fowling-piece, recently discharged, lying by his side, and a piece of paper on his dressing-table, containing, in his own handwriting, the sentence, "I have done it."

This circumstance, and the fact that deceased had suffered some disappointment in love, seemed to indicate suicide, but there were several other facts which excited suspicion against the Bey, who was entitled to the £5000 if he survived the young man Readley, and who had only a short time before the death of the latter insured the life for £1000. As to the facts of the death itself, they were sufficiently mysterious, for although the wounds were of such a nature as to cause immediate death, the deceased was found lying covered with the bed-clothes, with his hands folded quietly across his breast. On the other hand, it may be urged that it was hardly worth while for the Bey to run the risk of a trial for murder in order to obtain the comparatively small sum of £6000, he having already received £20,000; and again, a surgeon would hardly adopt such a coarse method of murder as to shoot his victim in bed in a public hotel. The whole story, however, was sufficiently strange to justify the Belgian authorities in putting Risk Allah on his trial for murder, and the case will always remain one of the "*causes célèbres*" which the lovers of the marvellous will peruse with interest. Among the incidents of the trial itself, we are informed that the "experts" excited great sensation in court by their energetic mode of giving their evidence, and by their practical demonstrations of the opinions they held. We are told, for instance, that a live sheep was introduced on a bed in court, and was shot in order to show the effect of such a wound as that which caused Readley's death; and that one of the experts actually lay in the bed himself and discharged a gun under the bed-clothes, to show his opinion of the manner in which the suicide was accomplished. We

may add that the experts differed in their opinion as to the method by which the death was caused; some of them believing that it was a case of suicide, but others holding another view.

DR. HASSALL.

THIS well-known member of our profession has just been placed on the Civil Pension List, for his public and scientific services. While congratulating him upon having obtained the recognition of Government, and sincerely regretting to hear that he is suffering from severe illness, we cannot but express our surprise that Dr. Hassall should stand in need of a pension. In any other profession but our own his energy and learning would, assuredly, have secured him a better reward. At the same time we may add that when a contemporary journal, in the course of a flattering article, confesses that but for him its proprietors "might have been materially injured, if not absolutely ruined," we are tempted to ask whether Dr. Hassall could have been adequately remunerated for such important services? Surely if a journal be truly prosperous, contributors of such importance ought not to be left to the cold charity of the Civil List. Of course a journal with a declining circulation might reasonably make some such statement, but in one aspiring to lead opinion, and professing to be a good property, it is strange to read such an account of the liberality of proprietors who "*might have been*" ruined.

HACKNEY WORKHOUSE.

THE master and matron of this house have anticipated any action on the part of the Poor-law Board by sending in their resignations. It will be remembered that they refused to comply with the urgent request of the Medical Officer to admit a poor child in a dying state from cholera, and in spite of an attempt to throw blame on the Surgeon, the investigation clearly proved that they took upon themselves the entire responsibility of ignoring his wishes. It is to be hoped that their successors may act in a different spirit.

INTERNATIONAL MEDICAL CONGRESS.

OUR lively neighbours across the Channel, profiting by the great Exhibition to be held next year, are busy organizing an International Medical Congress, which is to open on the 16th of August, 1867, and last for about a fortnight. This will afford an excellent opportunity for those of our brethren who understand French, and can afford the time, to enjoy a scientific holiday in Paris. We believe that the subjects proposed for discussion are such as to interest many of our readers, and therefore subjoin the programme, merely adding that this does not exclude the introduction of other topics:—

1. Anatomy and pathological physiology of tubercle, including tubercularization in different countries, and its effects on the mortality.
2. Accidents that cause death after operations.
3. Can effective measures be proposed to the Governments, for preventing the propagation of venereal diseases?
4. On the influence of the diet of various countries in producing disease.
5. On the influence of climate, race, and the varying conditions of life on the function of menstruation.
6. On the acclimatization of Europeans in tropical countries.
7. On Entozoa and Entophytes in man. Those who may desire further information can address the Secretary, Dr. Jaccoud, 4, Rue Drouot, Paris.

POOLE DEFENCE FUND.

THE appeal to the profession for the reimbursement of Dr. Poole has met with a cordial response. The list of subscribers will shortly close, and we earnestly trust not without the liquidation of every shilling of the costs incurred.

THE LATE DR. SNOW'S SISTERS.

OUR profession has unfortunately ever been a needy one, notwithstanding the encouragements offered by our October orators. But it is more than usually humiliating that the relatives of a man who had attained such a reputation as the late Dr. Snow, and whose life was passed in the best kind of service to the people, should be compelled by straitened means to solicit aid from the Government. At a time when the epidemic he did so much to elucidate is ravaging our capital we should be guilty of a dereliction of our duty did we omit to urge the claim that has been so modestly put forward on behalf of his sisters. The theory he proposed as to the origin and propagation of cholera is now widely accepted, and even the minority who do not subscribe to his opinions testify to the value of his labours. He was a physician who worked hard throughout his career; he carried out in practice the precept—"Whatsoever thy hand findeth to do, do it with all thy might." He touched no subject on which he did not shed some light, and in all he did or undertook he conferred benefit on the nation. The Government is now asked to place his two sisters on the Civil Pension List. Can the request be refused? Every report of the Registrar-General, pointing to the propagation of cholera by water, is but the fruit of poor Snow's unrequited labours. The Medical Society of London has just passed a resolution to forward in every way the claim of his sisters to the nation's assistance. But this Society is exclusively medical, and medical men are well aware of Snow's merits. It is the public who require to be reminded, and on this account the Health Department of the Social Science Congress has exercised a more powerful influence in passing a similar resolution. The people are not ungrateful, and we therefore feel sure that Government will be applauded for such an act of justice, should they at once gracefully concede the claim. We trust, in our next impression, to be able to report that these two ladies are beyond want. We erect statues to the men who destroy life. Let us not suffer to starve the families of those who save it.

POISONING BY NORWAY LOBSTERS.

The Glasgow correspondent of the *Scotsman* represents the late supposed cases of fatal poisoning by shellfish in that city as veritable cases of cholera, and alleges that the medical gentleman in attendance is of that opinion. We have no doubt that that impression is incorrect, for we have had opportunity of observing a precisely similar case some years since. Five members of the family of a medical man in Dublin partook of some Norway lobsters, which were apparently perfectly fresh and good, and differing in no respect from others which had been eaten from time to time without injurious result. Five hours afterwards every person who had eaten was seized with violent purging and some vomiting, attacking with greatest severity those who had eaten most of the shellfish. Happily there was no fatal result; but as the family partook of no meal together, except luncheon, at which the shellfish was consumed, it is evident that it must have been the cause.

We may remark that the Norway lobster described in the papers as "Norwegian shellfish," is native in our seas, and commonly known in our markets as prawns, and is not necessarily a foreign importation at all.

THE LONDON CHOLERA RELIEF FUND.

THE Committee of this Fund have presented their report, which will be found in another part of our issue. It appears that, within their knowledge, there have been 4396 deaths from cholera, and 646 from diarrhoea. For the relief of the distress, consequent on this mortality, about £40,000 passed through their hands, and their estimate of the total sum

contributed and expended reaches the princely sum of £70,000. This sum amounts to £14 expended for every death in London, and not much less than £1 for every case, six out of seven of which were diarrhoea.

The Cholera Relief Fund in Dublin cannot hope to emulate even its relative proportion of this munificent charity. Let it be remembered, however, that while the relative mortality in Dublin has been greater, the condition of the unfortunate widows and orphans is even worse, and let us hope that few will give grudgingly to so urgent an appeal for help.

THE IRONWORKERS' STRIKE AND THE CHOLERA.

IT would appear that the workmen in the iron trade have taken all their measures and are prepared to wage a desperate war with capital during the winter months. It is not for us to dilate upon the politico-economical aspects of the strike, but we may fairly draw attention to one fact of considerable import to a large number of our professional brethren.

Cholera has not yet left our shores. According to the most recent accounts it has assumed a very threatening appearance in numerous northern towns. It is not at all improbable that the districts where the men are on strike may have to endure the additional calamity of an outbreak of cholera. Are the leaders of the trades-unions prepared to invite the epidemic? They will argue that the men on strike will be supported by the unions as well as by their earnings, but has this ever been the case? We know by experience that strikes bring want in their wake, and that hunger and distress afford food to disease, especially to epidemics. When these calamities are upon them, we know also that the men will turn instinctively to our profession for aid, and our brethren will devotedly labour to alleviate the pain and distress around them. The sufferers will be unable to pay, and thus another item will be added to the huge debt of the people to the medical profession. Nevertheless, it is a hard thing that the doctor, who devotes all his energies to the emergency and often sacrifices his life to the calls of humanity, should be left unrequited—that, as too frequently happens, at his death he should leave his wife and family unprovided for. If the trades-unions support hundreds of men in idleness, they might as well devote part of their funds to the payment of their members' doctors' bills.

We do not suppose our suggestion will be adopted. The doctor is only appreciated at the moment his services are wanted. But we beg to ask the supporters of those strikes, which bring so much misery, what would be the consequence if the medical men united in a similar manner and refused to attend any man on strike until they had received their fee?

THE VACANT SURGEONCY OF DR. STEVENS' HOSPITAL.

THE election to the vacancy caused by the death of Dr. Glascott Symes has been adjourned to the 15th inst. The candidates who presented themselves for this important office were only two—Dr. De Ricci and Dr. O'Grady. The election was not proceeded with, and it was determined to adjourn, with a view to advertising the vacancy.

We believe the explanation of the absence of competition for the appointment is, that it was tacitly understood that the elected surgeon must be prepared to undertake the duty of lecturer in the medical school attached to the hospital. We understand that a section of the Board of Governors, including two learned judges, repudiated this understanding, and insisted on an adjournment, that the office might be thrown open to candidates for the hospital surgeoncy alone.

In addition to those mentioned, two very formidable candidates are now in the field—Mr. Butcher, the President of

the Royal College of Surgeons, well known by his writings to our readers; and Dr. Robert McDonnell, a physiologist of some distinction, and a Fellow of the Royal Society.

THE CHARTER OF THE QUEEN'S UNIVERSITY IN IRELAND.

THE Secretary of the University has received official intimation that proceedings are about to be instituted in Chancery to restrain the Senate from acting on the Supplemental Charter accepted by them at their late meeting.

THE MEDICAL COUNCIL.

A SIGN of activity at length appears in the Medical Council. The Registrar has been directed to erase several names from the Register. The offences for which this punishment has been decreed include felony, perjury, misdemeanour, registration fraudulently obtained, and infamous conduct in a professional respect. Now that the first step has been taken, it remains to be proved whether the Council will see that their decree carries with it the punishment intended, and prevents the delinquents from acting as medical practitioners, or whether they will allow an evasion of the law to make their decision practically of no avail.

THE MANSION HOUSE CHOLERA FUND.

THE Mansion House Cholera Relief Committee, to which we have on several occasions directed attention, has now closed its labours. During the three months in which it has existed, it has powerfully contributed to alleviate the distress caused by the epidemic, and has demonstrated how the large-hearted liberality of the English people can be directed to the noblest purposes by a machinery called into existence in a few days to meet a special emergency.

In the first week after the Lord Mayor made his appeal, about £1000 per day was sent to his Committee; and, in fact, when the disease began to abate, so continuously did the money come in that it seemed probable a large surplus might be left on hand at the close of the epidemic. The Committee has distributed in the best possible manner some £20,000. Half this amount was applied by means of local agency to those districts in which cholera was most prevalent. About £2000 was reserved for convalescents, and £7000 was appropriated for the orphans and widows of those who have died of the disease.

The report of the Committee, agreed to at the final sitting on the 29th ultimo, is a document of such interest in the history of the epidemic, and tells its own tale so clearly, that we cannot do better than append it in full:—

“Early in the month of August it became too evident that there existed great distress and suffering in the cholera-stricken districts of the east and north-east of London. A deputation of gentlemen connected with the city waited on the Lord Mayor and invited his Lordship to place himself at the head of the committee for dispensing a City Cholera Relief Fund. The Lord Mayor gave his warm approval to their proposals, and this committee held its first meeting at the Mansion-house, under his Lordship's presidency, on the 7th of August.

“At that time the great want in the cholera districts was local organization to grapple with the disease. The first care, therefore, of this committee was to create local committees in those districts, not merely for the administration of relief, but also for a house-to-house visitation, and for the application of precautionary and remedial measures. They were also especially anxious that a fund entrusted to them as a cholera fund should not be diverted to purposes of general relief, and to meet these objects they laid down from the first the principle that ‘the funds placed at the disposal of this committee shall be applied only to the prevention of cholera, to the relief of cholera patients and of

sufferers from the effects of that disease, and that all grants shall be administered as far as possible through local committees.’ To this principle the Mansion-house Committee have steadily adhered, and to it they attribute much of the success which has attended the administration of the fund. Of the 92 local committees and institutions with which this committee has been in communication, a large number became committees for cholera purposes, and many were called into existence owing to this determination.

“To these local boards and to hospitals and dispensaries 164 grants have been made, amounting in all to £9121 9s. In every instance the committee required an undertaking that the money should be applied exclusively to cholera purposes, and that a return should be made of the manner in which the grant had been expended. In the distribution of so large a sum to thousands of cases, mistakes must necessarily sometimes be made, even by the most vigilant of local boards; but this committee have reason to believe that the grants were generally well administered, and that the money in the great majority of cases was appropriated to the purposes for which it was given by the public.

“At an early stage of their proceedings the committee took into consideration the claims of orphans, and voted them a sum of £5000, which they subsequently increased to £6570. The course taken was as follows:—In the first instance a return was called for from each local committee of all the children in their district who had been left orphans by the cholera. The returns, which stated all the particulars connected with each child, were submitted to a careful scrutiny, all errors were, as far as possible, corrected, and the whole digested in a tabular form. A selection was then made from the corrected lists; all children were excluded whose parents had been in the habit of receiving parochial relief, as it was felt that for all such orphans provision should be made out of the poor-rates. Children who had relatives able to support them were excluded, also those above the age of 15, and those whose fathers were still living, and were not permanently disabled from work. The next step was to confer with the Metropolitan Relief Association, who had also resolved to set apart £5000 for the relief of orphans. Care had to be taken that no orphan should be relieved out of both funds; and the two committees, having compared their lists, divided the orphans, amounting to over 1260, between them. Since that time others have been added to the list, and in all 710 orphans have been assisted out of the Mansion-house Fund, with a total grant of £6570. A detailed scheme was required from each local committee of the manner in which the money would be applied to the maintenance of each child; and also a written undertaking so to apply it, signed by persons willing and competent to act as trustees. It was not until these schemes had been examined and accepted, and the names of the trustees had been approved, that the grant in each case was finally paid.

“The case of widows left in a state of destitution also engaged the attention of the committee, and £541 was set apart to be distributed in small sums wherever such relief could be of permanent benefit; 277 widows were thus assisted, and with the most beneficial results. In addition to the grants already enumerated, a sum of £2000 was set apart for convalescents. No greater boon can be conferred on the poor in sickness than to aid them in the earlier stages of recovery by giving them the means of removal into a purer air, and maintaining them until strong enough to return to work. It was with much pleasure, therefore, that the committee voted grants to all well-planned undertakings for the relief of cholera convalescents. In addition to the grants of £2000 specifically made for this purpose, considerable sums were employed for the benefit of convalescents by the local boards out of the grants which they had received from this fund.

“The committee have received cholera returns from 56 local committees and from 14 hospitals and dispensaries, but these returns do not include all cases received into the larger hospitals, and are not made up to the present date. The number of persons attacked with cholera is returned at 10,424, and with diarrhoea at 68,975; of those 4396 died from cholera, and 646 from diarrhoea. These returns, however, are almost entirely made up of cases in the east and north-east of London, and convey an inadequate idea of the extent of the epidemic.

“The funds placed at the disposal of this committee and of the Metropolitan Relief Association amounted to a sum

not far short of £40,000, and to this must be added the Cholera Fund of the London Hospital, amounting to many thousands, and the many contributions which flowed through other channels. It is below the mark to say that £70,000 have been contributed to relieve the sufferers from this calamity.

"They cannot conclude their report without calling public attention to those permanent evils which lie at the root of almost all epidemic diseases, and which are not to be cured by temporary expedients. All such efforts are only temporary palliatives, and often draw off public attention from the urgent need for permanent reform. The real evil remains wholly untouched. That evil is to be found in the wretched sanitary and social condition of a vast number of the labouring classes; and especially in the filthy, dilapidated, and overcrowded dwellings, in which many of them are compelled to reside. This miserable condition results partly from public neglect, partly from the unwillingness of landlords to do their duty, and from causes over which the poor themselves have no control; but in some measure also from the ignorance and from the improvident and intemperate habits of too many among the poor. Of all the matters which affect the peace and prosperity of this nation, there is not one more full of danger, or which more urgently needs reformation, than the sanitary and social condition of the poor in London and in our great towns.

"Signed on behalf of the Committee,

"B. S. PHILLIPS, Lord Mayor.

"Mansion-house, October 29."

Correspondence.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I was perfectly amazed and astounded on reading in the columns of your journal that the M.D. Honoris Causa, which was awarded to Professor Greene by the Senate of the Queen's University, is confirmed by you—that it is an accomplished fact, a stern reality, upon which there can be no doubt, and about which there can be no misunderstanding.

Such proceedings are perfectly disgraceful to the Senate of the Queen's University, who granted the degree, and to Professor Greene, who did not blush to receive it at their hands. If, Sir, the M.D. Honoris Causa was in reality only an honorary title—if it did not entitle the Professor to practise Medicine and Surgery as a properly qualified medical man, to give evidence in courts of law, and to hold medical appointments—then, sir, these negative qualities might be urged in extenuation or mitigation of such proceedings, or form a kind of apology or excuse for them; but when we find that Professor Greene is entitled by his Honoris Causa degree to every right and privilege that a man who has gone through the proper curriculum at a recognized University has a right to, then, sir, the injustice of granting such a degree becomes glaring in the extreme.

I perfectly agree with you that the Medical Council should take the matter into hands, and if they be powerless with respect to the prevention of the granting of such degrees, they should at least make it known to the several examining boards, in a plain and explicit manner, that they will not receive or recognize such honorary degrees.

By inserting this in your valuable journal you will do me a great favour.—I remain, sincerely yours,

GEORGE WM. THOMPSON.

Castlewilliam, 1st November, 1866.

DR. MARY WALKER visited one of the London hospitals on Saturday week, and was conducted through the establishment. The students were somewhat surprised at her appearance, for it seems that she has not only donned the M.D., but the breeches as well. She wears a low-crowned plain felt hat, a dark plush coat not quite reaching to the knees, and black cloth trousers.

THE LATE POOR-LAW INVESTIGATION AT DONNYBROOK.

THE official verdict of the Poor-law Commissioners on the conduct of Dr. Murdock in this case was read at the meeting of the Board of Guardians of the South Dublin Union on Thursday last. It will be remembered that a charge of neglect was made against Dr. Murdock, on the death of a woman from cholera. Application had been made to that gentleman several times, but the case had not been represented as urgent, and he had given prior attention to another case of cholera within his district, the first not being strictly within his duty at all. The decision of the Commissioners is to all intents a complete acquittal of Dr. Murdock. The Commissioners observe as follows:—

"The circumstances detailed in evidence throw great discredit on the administration of medical relief in the Donnybrook district, and unfortunately at a time when it was most desirable that confidence in the efficiency of the arrangements to meet the invasion of cholera should have been established; and the Committee of Management themselves appear to the Commissioners to be by no means free from blame in the matter, but, on the contrary, to be responsible in some measure for the unhappy series of circumstances which deprived Elizabeth Aspill of the timely aid to which, by law, she was entitled, and which, if rendered in due time, might possibly have preserved her life. As regards Dr. Murdock, it is clear that in strictness he was not bound to attend a case arising out of his district, while there was another medical officer responsible for attending; but unfortunately he did not decline to attend the case; and, according to his own statement, the messenger was given reason to expect that he would do so, and thus it never became known to the husband of the poor woman that he ought to apply to Dr. L'Estrange, who, the Commissioners presume, if applied to would have attended the case immediately. The result has been that a poor woman, suffering in advanced stage of cholera, remained seven hours without receiving medical assistance, although living within a few hundred yards of the dispensary, and although her husband was vainly all that time endeavouring to procure the assistance that it occurred to him to get. The repeated messages delivered at Dr. Murdock's residence showed sufficiently that the case was one of urgency, and if, through his servant's default, whose evidence on the subject was by no means satisfactory, he did not receive all of them, still he should have adopted a more decided course, and either declined going, or have attended with more promptitude."

A censure on Dr. Murdock, because "unfortunately he did not decline to attend the case," is equivalent to a testimony to his earnest desire to go even beyond his duty in the cause of humanity, and is the highest compliment which could be paid to him. We simply ask what expletive would have been sufficiently strong for certain members of the Board of Guardians, if Dr. Murdock had decisively refused to attend the case? We can imagine the feelings of these gentlemen, who used every influence to transfer the blame of the gross neglect of the Dispensary Committee, in omitting to have correct notices posted in the district, to the unfortunate doctor, who, it now appears, was guilty simply of an over-anxiety to do his duty, which it would be well if his masters had emulated.

THE MATRICULATION EXAMINATION OF THE QUEEN'S COLLEGE, GALWAY.

THE following letter appears in the *Freeman's Journal*, signed "A Student, E.S.R." We give it with a view of court-ning a denial and refutation, and that it may stand with our readers *quantum valeat*. The instances are almost incredible:—

"KEEPING UP THE STANDARD.

"TO THE EDITOR OF THE FREEMAN.

"MY DEAR SIR,—As it is so seldom that facts concerning the Queen's College, Galway, are brought before the public,

I hope you will have no objection to insert this letter in your influential journal. I have been, for the past week, present at some of the scholarship examinations held annually in this institution, and although in the very midst of puzzles and conundrums, yet I could not refrain from contrasting the present appearance of that hall with that of years gone past, not that any material change has taken place in the hall itself, but there has indeed in the occupants thereof. Alas! that hall which once contained men of years, education, and ability, is now thrown open to every comer, provided they possess 10s. as college fee, and have heard of the Latin grammar, Greek letters, English parts of speech, and the simple rules of arithmetic. No doubt a few candidates may know a little about the course of matriculation, but the majority of them are wonderfully ignorant. Let me ask then, ought any one be allowed to become a member of any college who would say that the word 'horse' was a 'pronoun,' 'you' an 'interjection,' and that the 'Black Sea' separated France from Spain? I certainly think not, and still, wonderful to be told, they are 'passed' by the examiners here. I know, on private information, that not a single candidate for matriculation in Queen's College, Galway, this session has been rejected. No doubt the examiners are determined to keep up the numbers in this college, being at the same time indifferent as to whether they possess a preliminary education or not. I know very well that the 'entrance' examinations of most colleges are 'shams,' but there is, or at least ought to be, a certain limit."

LEGAL INTELLIGENCE.

HOW THE MEDICAL PROFESSION IS IMPOSED UPON.

At the Marylebone Police Court, Mary Martin, 24, who described herself as a sempstress, living at 4, Ware's-passage, Chalton-street, Somers Town, was charged with attempting to obtain money by false pretences from Dr. Dyce Duckworth, a physician, residing at 70, Wimpole-street, Marylebone. The prisoner was further charged with obtaining 2s. 6d. from Dr. Duckworth under a false and fraudulent pretence.

Prosecutor said that about twelve o'clock the previous night he was aroused by the prisoner coming to his house, and on inquiring her business she stated that her sister had suddenly been seized in labour, and implored him to give her some pecuniary assistance to enable her to convey her to the Queen Charlotte Lying-in Hospital, Marylebone-road. He at once recognized her as a woman who came to him at a similar hour one night in September last, when she told him a story somewhat like the present, but she then stated that her name was Mary Wells, and it was in consequence of what she then told him that he gave her half-a-crown. Subsequently he discovered that the whole of her statements were false, and it was on that account he (on the previous night) called in a police-constable and gave her into custody.

Police-constable 105 D deposed that the prisoner had given a false address.

She was remanded for a week for inquiries to be made.

At Greenwich Police Court, Mr. H. Denny, 314, Rotherhithe-street, Rotherhithe, appeared to a summons charging him with falsely representing himself to be and practising as a surgeon, whereby he had rendered himself liable to a penalty of £20. Mr. Hughes, solicitor, of Woolwich, attended for the prosecution, and Mr. Brookes for the defence. Mr. Hughes, in opening the case, said the proceedings were taken under the 21st and 22nd Victoria, cap. 90, sec. 40, and they had been instituted for the protection of the public. Mr. Rogers, a surgeon, of Rotherhithe, deposed that, having seen a plate at defendant's place of business describing himself as a surgeon and accoucheur, and knowing that he had attended patients, witness wrote to him, saying that he could not allow an unqualified person to practise within 200 yards of his own residence without noticing it. The defendant afterwards called upon him and stated that he was attending patients for a cousin, who was a surgeon, but he did not state where his cousin lived. He pointed out to the defendant that he was doing wrong, when the defendant defied him, saying there was nothing in the Medical Act which could touch him. Mr. W. Murdoch, surgeon, of Ro-

therhithe, said the defendant had been describing himself as a surgeon about twelve months. A short time ago witness was called to attend a man who had met with an accident on board ship. On going on board the vessel he met the defendant attending the case, the man being then dead. The defendant said there would most probably be a post-mortem examination of the body ordered, which witness could make, but that he should expect half the fees. The witness told defendant that, being a qualified man, he could have nothing to do with him. Mr. Hughes here said he would put in the *Medical Directory*, which did not contain defendant's name, and in the absence of proof to the contrary this was to be taken and received as evidence that the defendant was not a qualified person under the Act. Two women were also called as witnesses, one the mother of a child whom the defendant attended in its illness. They deposed that defendant stated that he could not attend without being paid 1s. 6d. for each visit, and the mother of the child said she had paid five such visitation fees at the time of obtaining the medicines. The child, she added, died. Mr. Brookes, for the defence, said the defendant was at present attending the necessary course of lectures at Middlesex Hospital, and had taken up all but one degree which would entitle him to practise as a surgeon. Under these circumstances, he had to ask that his Worship would not consider the case as one of a quack doctor, or as deserving of punishment by way of fine. Mr. Traill said the case was one which the Act of Parliament under which the present proceeding was taken was passed to provide against. It had been proved that defendant had, for at least a period of twelve months, represented himself as a regularly qualified surgeon, and for which he would pay a fine of £10 and costs, being half the full amount. The defendant became excited on hearing the decision, the effect of which would be, he said, that he should sell his business as a chemist to some one who would also put out a plate describing himself as a surgeon. Mr. Traill said the observations of the defendant showed that he had acted unwisely in not imposing the full penalty of £20, and if the fine and costs were not paid on the following day a distress warrant upon his goods for the amount would issue.

THE POOR-LAW IRISH INSPECTORSHIP.

THIS important office has been filled up by the appointment of Mr. Roughan, of Ballinrobe. Not being informed what that gentleman's qualifications for the office may have been, we append his description of himself in the "*Medical Directory*:"—"Roughan, George F., Ballinrobe, county Mayo, L.R.C.S.I., 1842; L.M. Dub. Lying-in Hosp., 1846; Med. Off. Union Workh.; formerly Med. Att. Moycullen, Spiddal, and Outerard Fev. Hosps.; late Insp. Fev. Hosps."

Mr. Roughan is what racing men would call "an outsider," for we have never heard his name mentioned as a candidate, and he is almost unknown either to the profession generally or Poor-law Medical Officers. He is a L.K.Q.C.P., of August last, never wrote a line worth reading—never held an investigation or adjudicated on a case. But he possesses superior qualifications. He is a Roman Catholic in religion, and is said to be of the extremest national politics.

To summarise the facts, he appears to possess every qualification which a medical man elected to such a position ought not to have. To any candidate on the list published in a late issue of our journal, or to others not included in that enumeration, Dr. Roughan bears not the most cursory comparison. Many of these gentlemen being of scientific and literary rank, all of them are well known and respected in the profession. The selection is a theme for our political journals worthy of their notice, for they have ample scope for comment in an appointment which stands badly beside that of Professor Croker King's, the last selection of Sir Robert Peel for a similar post. As soon as the inquiries which we have instituted are completed, we mean to return to this matter; at present it looks like one of the most disgraceful jobs ever perpetrated in Ireland.

THE VOLUNTEER SURGEONS AT BRUSSELS.

THE Surgeons of Volunteer Regiments present at the late meeting at Brussels have, with justice, complained of an insult offered to them by Colonel Lindsay, in omitting to include their names in the lists forwarded to the Belgian Minister for invitation to the dinners and fêtes to which combatant officers were bidden. This is a gratuitous insult, which ought not to be passed over, and Volunteer Surgeons, in the course which they may take, should remember that their services to the volunteer regiments are of a nature such as they may at any time resign, should it be attempted, in spite of their remonstrance, to degrade them in the eyes of their coequal combatant fellow-officers.

THE SUPPLEMENTAL CHARTER OF THE QUEEN'S UNIVERSITY IN IRELAND.

A MEETING of the Committee of the Senate was, we understand, held within the last week to take into further consideration the steps to be taken with reference to the adoption of the Supplemental Charter. The first proposition which came under discussion was that the Queen's University, Trinity College, the Catholic University, and the Magee College, Derry, should for the present be the only Colleges recognized under the new charter, as qualifying for the degrees of the University in affiliation with the Queen's Colleges of Belfast, Galway, and Cork. This proposal having been negatived, it was further moved and carried, that candidates from other educational bodies be admitted, but that they be required to study three years and pass six examinations at the University within that period, while candidates educated at the Queen's Colleges and affiliated bodies should be required only to pass two examinations conducted in each institution by its own examiners. It must be manifest to our readers that this last proposition is simply a prohibition on all students who may be prevented by any circumstances from taking their education in the recognized Colleges. It would be almost as unreasonable to require the extra collegiate candidate to pass sixteen as six examinations, such a requirement being equivalent to disfranchising other educational bodies altogether.

Medical News.

APOTHECARIES' HALL OF LONDON.—The following gentlemen passed their examination in the Science and Practice of Medicine, and received certificates to practise, on October 25th:—

- Bowen, David, Newport, Pembrokeshire.
- Coombs, Rowland Hill, Bedford.
- Cremonini, John, Tottenhall, Staffordshire.
- Denton, Frederic George, Claycross.
- Grime, John, Blackburn, Lancashire.
- Hall, John Henry Wynn, Barking-road, E.
- Heelas, Martin Luther, The Holt, Wokingham, Berks.
- Levick, George, West Ham, Essex.
- Marriott, Osborne Delano, Sevenoaks, Kent.
- Wilkinson, Alfred George, Aston-road, Birmingham.

THE FACULTY OF MEDICINE OF PARIS.—Loud complaints have of late been made touching the inefficient manner in which the professors are discharging their duties. Ill-health and advanced age have disabled several of the eminent men occupying chairs, and the work has mostly been done by substitutes. Resignations have, however, recently come in. M. Trousseau has resigned from pressure of practice, M. Andral from ill-health, and now we find that the well-known M. Piorry has also given up his chair. *L'Union Médicale* states that several other resignations will soon be sent in.

By this mail a contribution to science is forwarded to one of the London societies by Dr. Hector, F.R.S., the Go-

vernment geologist, in the shape of some elaborate drawings, &c., of a portion of a moa's egg, with the bones of the chick in an advanced state of incubation. The egg was found at Otago.

IN some parts of Germany every bottle containing poison is labeled with a death's head and cross bones, and every parcel of poisonous medicine sent to a patient has a similar label over the address.

MR. CORBETT, the Metropolitan Poor-law Inspector, has lately visited Lambeth Workhouse several times, prosecuting inquiries as to the alleged locking up of women. The master and matron of the establishment have tendered their resignation.

ANALYSIS of the water of the several London Water Companies for the month of October, by Professor Frankland, F.R.S., of the Royal College of Chemistry:—

Companies.	Number of Houses supplied in September, 1866.	Average Quantity of Water in Gallons during the Month of September, 1866 (See note.)	Solid Matter in 100,000 parts of the Water.	Organic and Volatile Matter included in Col. 4.	Amount of Oxygen required for oxidation of Organic Matter.	Total Hardness.
Thames.						
Chelsea.	36,463	8,212,800	27.54	0.70	.0834	18.5
West Middlesex	26,147	8,744,436	26.38	0.72	.0730	19.1
Southwark and Vauxhall	73,895	3,801,000	28.11	1.30	.0670	20.0
Grand Junction	25,631	8,861,011	28.97	0.79	.0761	20.2
Lambeth	36,728	9,755,600	28.58	1.70	.0804	20.0
Other Sources.						
Kent	33,162	6,830,229	39.28	1.40	.0082	27.4
New River	112,535	23,923,000	26.56	0.71	.0258	18.5
East London			30.21	1.25	.0425	20.2
Do., filtered through animal charcoal	90,174	20,726,981				
South Essex*	850	209,914	21.71	0.28	.0073	7.1
			38.91	0.98	.0088	25.3

The table may be read thus:—100,000lb. of Chelsea water contained 27.54lb. of solid matter, of which 0.70lb. of organic and other volatile matters was driven off by incineration; 0.0834lb. of oxygen was required to oxidize the organic matter in the said quantity of Chelsea Water. Of the solid matter, 18.5lb. were carbonate of lime, or its equivalent of hardening salts. The fourth column contains the amount of solid matter left on evaporation and desiccation at 120 deg. C.—130 deg. C. (248 deg. F.—266 deg. F.) The results are recorded in 100,000 parts. By moving the decimal point one place to the right the above figures express in milligrams the quantities contained in one kilogram of the several waters. The waters were all free from turbidity when drawn from the companies' mains.

Note.—The water includes the supply for manufactures and for various purposes other than domestic consumption. This return, as compared with that for the previous month, shows an increase of 319 houses, and a decrease of 4,568,793 gallons of water supplied daily.

* The secretary to the South Essex Waterworks Company states:—"We have not extended our mains at present west of Romford."

THE *Times* records the arrival of Miss Shaw Stewart, and eight other lady nurses, at Woolwich, from Nctley, and says that the inmates of the military hospitals prefer the attendance of the male nurses of the Army Hospital Corps. Of the 300 patients now in the Herbert Hospital, nineteen out of twenty have expressed their dislike at having the attendance of these lady nurses thrust upon them, contrary to their desire.

THE precautions taken in the French cholera hospitals to prevent the spread of the disease are of the most minute character. On the death of a patient, for instance, phenic acid is sprinkled all round the bed; in the coffin the body rests on chloride of lime, and the remainder of the space is filled with sawdust impregnated with phenic acid. Lastly, when the coffin is placed in the grave, and the latter partly filled up, a layer of chloride of lime is spread all over, and moistened with a watering pot; the grave is then completely filled up, and chloride of lime again sprinkled upon it.

MISS BURDETT COUTTS is about to establish a great covered market in Bethnal-green. Provisions will be sold there cheaply under strict inspection, so that the sale of unwholesome food will be prevented.

THE quarantine imposed on arrivals from Great Britain at Malta has been reduced from fifteen to ten days.

THE Midland Medical Society of Birmingham has just entered upon its nineteenth session, with the following officers:—President: Mr. J. S. Gamgee. Vice-Presidents: Dr. Wade and Mr. Alfred Baker. Treasurer: Mr. J. Harmar. Hon. Sec.: Dr. Balthazar W. Foster. Hon. Librarian: Mr. E. Mackey. The first ordinary meeting of the Society was held on Wednesday last, October 24th, at the Birmingham Midland Institute, when interesting pathological specimens were exhibited by Mr. Goodall, Dr. Foster, and Mr. Mackey, and an able paper on Cerebro-spinal Meningitis was read by Dr. Wade. The Society meets twice a month, from October to May.

THE judicial statistics for 1865 contain several interesting statements. The total number of summary convictions before magistrates during the year was 312,832. Of these 470 offenders were flogged. In 1864 the number whipped was 443. Assault cases appear to be greatly on the increase. In 1865 the number amounted to 13,834, being an augmentation of 388 over the preceding year. Under the head of Coroners' Inquests, it appears that the number in 1865 amounted to 25,011. Of these no fewer than 8667 were upon children under sixteen years of age, and 11,397 are returned under the head of Accidental Death. There is an addition of 275 to the number of offences against the Game Laws, which were 10,892 during the past year.

DR. DANIEL BRAINARD, Professor of Surgery at the Medical College of Chicago (Illinois), has just been carried off by the cholera on returning from a voyage to France. He is well known by various memoirs on surgical subjects, among others the injection of spina bifida with iodine, and the treatment of ununited fracture by suture of the bones.

CORONERSHIP OF THE CITY OF LONDON.—There is a probability of a vacancy taking place in this office, as Mr. Serjeant Payne, who has held the appointment thirty-seven years, has applied for the retiring pension which the Act of Parliament allows. We understand that a candidate will probably appear in the person of a Graduate in Medicine of the University of London of some standing in the Profession, and who is the author of a work on the Hospitals, &c., of Paris.

SOUTH DUBLIN UNION.—An election of a third medical officer took place last week. Several candidates had applied, but all withdrew except Dr. Joseph Burne (*sic*), son of Mr. John Byrne, T.C., who had up to the present acted as extra medical officer to the Grand Canal-street Dispensary.

ROYAL COLLEGE OF SURGEONS, EDINBURGH.—At the annual meeting of this College, held on Oct. 17th, the following office-bearers were elected for the ensuing year:—President: James Dunsinure, M.D. Treasurer: John Gairdner, M.D. Secretary: James Simson, M.D. Librarian: Archibald Inglis, M.D. President's Council: James S. Combe, M.D., Andrew Wood, M.D., Robert Omond, M.D., Benjamin Bell, James D. Gillespie, M.D., James Spence. Ex. Off.: John Gairdner, M.D. Examiners: James Simson, M.D., Richard Huie, M.D., William Dumbreck, M.D., Archibald Inglis, M.D., Andrew Wood, M.D., Robert Omond, M.D., James Dunsinure, M.D., Peter David Handyside, M.D., James D. Gillespie, M.D., Henry D. Littlejohn, M.D., Patriek H. Watson, M.D., David Wilson, M.D. Assessors to Examiners: James S. Combe, M.D., James Syne, William Brown, James Spence. Conservator of Museum and Registrar of Students' Tickets: William R. Sanders, M.D. Officer: John Dickie.

WHEREAS formerly five children might be counted for each marriage in France, at the commencement of the century that number fell to four; and now each marriage hardly produces three children in the country and two in Paris.

THE MEDICAL DIRECTORY.—Prospectuses have been issued of a "Directory of Homœopathic Practitioners," at the head of which is printed the exact registered title of the "London and Provincial Medical Directory," which Messrs. Churchill have published for twenty-two years. Pending proceedings against the proprietor of the homœopathic work in question, Messrs. Churchill caution advertisers against being misled by the imitation.

BIRTHS and DEATHS registered and METEOROLOGICAL during the Week ending Saturday, October 27, 1866, in the following large Towns:—

Boroughs, &c.	Estimated population in middle of the year 1866.	Persons to an Acre. (1866.)	Births Registered during the week ending Oct. 27.	Corrected Average Weekly Number.	Deaths.			Temperature of Air (Fabr.).	Rain Fall.

3	29.73	57	51	56	54	SW	—	—	do.

Notices to Correspondents.

Nauta—Latin is very particularly required for the Navy Competitive. If, as you say, you know nothing of it, you cannot acquit yourself creditably in any branch of the profession.

J. M. C.—We fear you have no redress. The matter has been repeatedly represented to the authorities.

Dr. M.—Dr. Armstrong, King-street, Cork, will receive your subscription with thanks.

Mr. Cason.—The notice has been received.

Dr. R. shall receive a private note.

A Sufferer should avoid the whole tribe of quacks, and place himself under the care of a respectable surgeon.

St. Peter's Hospital for Stones in the Bladder and other Urinary Diseases, 54, Berners-street.—The Medical Staff at this Hospital has been re-organised. Mr. T. W. Nunn, Mr. Walter J. Coulson, and Mr. W. F. Teevan, have been appointed surgeons, vice Mr. Armstrong Todd. Assistant-Surgeon: Mr. W. Herbert Scott.

Communications received from Mr. J. P. Cesari, St. Peter's Hospital Mr. Herbert Jackson, Mr. Ruding, &c.

ERRATA.—In Dr. Hayden's paper on "Cerebro-spinal Arachnitis" in our last, p. 440, l. 51, the words coloured respiration should have been laboured respiration, and same p. l. 57, meeting the roots of the spinal nerves should be enveloping.

BOOKS &c. RECEIVED.

Diarrhoea and Cholera: Their Nature, Origin, and Treatment. By John Chapman, M.D. London: Trübner and Co., 60, Paternoster-row.

Pharmaceutical Journal for November. London: John Churchill and Sons.

The Calendar of the Pharmaceutical Society of Great Britain. The Journal of Anatomy and Physiology. No. I., 1866. Macmillan and Co., London and Cambridge.

Late Publications in Medicine & Science,

(From the Publishers' Circular.)

- In Medical Literature we note Clinical Histories, with comments by Henry Day, M.D.; Works on the Cholera, by Charles Shrimpton, Archibald Billing, and others; a New Method of Treatment of Cancer, by W. H. Broadbent; on Exuberant Growths of the Tonsils, by James Carsley; and a volume on Bleeding and Change in Type of Diseases, by W. O. Markham.
- Anderson (Dr. McCall)—Contributions to Dermatology. 8vo, sewed, 8s.—Churchill.
- Beatty (Thomas Edward)—Contributions to Medicine and Midwifery. 8vo.—Dublin, Fanning, pp. 653, cloth, 15s.—Longmans.
- Billing (Archibald)—On the Treatment of Asiatic Cholera. New ditto, 8vo, sewed, 1s.—Churchill.
- Broadbent (W. H.)—Cancer: a New Method of Treatment. 8vo, sewed, 1s. 6d.—Churchill.
- Brown (I. Baker)—On surgical Diseases of Women. 3rd edit., revised and enlarged. 8vo, cloth, 15s.—Hardwicke.
- Chapman (John)—Diarrhoea and Cholera; their Nature, Origin, and treatment through the Agency of the Nervous System. 2nd edit., enlarged. 8vo, pp. 266, cloth, 7s. 6d.—Trübner.
- Crisp (E.)—On Malignant Cholera: its origin, Pathology, &c. 8vo, cloth, 5s.—Hardwicke.

Appointments.

LONDON.

- ANNETT, H., M.R.C.S.E., has been appointed Surgical Registrar to the Middlesex Hospital.
- BUCE, A., M.B., F.R.C.S., has been appointed Surgeon to the Islington Dispensary.
- VELEY, W., M.D., has been appointed Medical Registrar to the Middlesex Hospital.
- ULSON, W. J., F.R.C.S.E., has been appointed one of the Surgeons to St. Peter's Hospital for Stone.
- ENN, T. W., F.R.C.S.E., has been appointed one of the Surgeons to St. Peter's Hospital for Stone.
- EVAN, W. F., F.R.C.S.E., has been appointed one of the Surgeons to St. Peter's Hospital for Stone.
- ANKART, J., M.B., F.R.C.S.E., has been appointed Surgeon to the Metropolitan Free Hospital, Devonshire-square, vice G. Borlase Childs, F.R.C.S.E., resigned.
- GROTH, L.R.C.P.L., has been appointed Physician to the Islington Dispensary, vice W. H. Witherby, M.D., resigned.
- OCR, ALEX., M.B., F.R.C.S.E., has been appointed Surgeon to the Islington Dispensary, vice H. Summerhayes, M.R.C.S.E., resigned.
- ATER, S., M.R.C.S.E., has been elected Surgeon to the Metropolitan Free Hospital, Devonshire-square, vice J. Hutchinson, F.R.C.S.E., resigned.
- UCKNELL, H. H., M.B., M.R.C.P.L., has been elected Physician to the Royal Infirmary for Diseases of the Chest, City-road, vice J. Althaus, M.D., resigned.

PROVINCIAL.

- MILTON, A., L.R.C.P., Edinburgh, has been appointed House-Surgeon to the District Infirmary, Ashton-under-Lyne.
- ADINE, J. L., M.R.C.S.E., has been appointed Surgeon to the Village Hospital, Capel, Surrey.

- SANKEY, G., M.R.C.S.E., has been appointed Surgeon to the West Kent General Hospital.
- TAYLOR, J., M.D., has been appointed House-Surgeon to the North Staffordshire Infirmary, Etruria, Staffordshire.
- MICKLEY, A. G., M.R.C.S.E., has been appointed Resident Surgeon-Apothecary to the General Hospital, Nottingham, vice Littlewood, resigned.
- LITTLEWOOD, J., M.R.C.S.E., has been appointed Surgeon to the General Hospital, Nottingham, vice W. Wright, F.R.C.S.E., resigned.
- ELLISTON, G. S., M.R.C.S.E., has been appointed House-Surgeon and Secretary to the East Suffolk Hospital, Ipswich, vice Ralph Gooding, B.A., M.R.C.S.E., resigned.
- BARTON, Mr. G. P., has been appointed Medical Officer for the Lymington District of St. Thomas's Union, Devon, vice A. Bennie, L.R.C.P.Ed., resigned.

SCOTLAND.

- M'VAIL, D. C., L.R.C.P.Ed., has been appointed House-Surgeon to the Alanck Infirmary, vice A. J. Main, M.D., resigned.
- MALAN, C. H. W., C.M., has been appointed Medical Assistant in the Crichton Royal Institution, Dumfries, vice H. G. Stewart, M.D., appointed Medical Superintendent of the Newcastle-upon-Tyne Borough Lunatic Asylum.

IRELAND.

- STOKES, W., M.D., has been elected President of the Medical Society of the King and Queen's College of Physicians, Ireland, for 1866-67.
- BROWN, W., L.F.P. and S., Glasgow, has been elected Resident Medical Officer to the Fever Hospital and House of Recovery, Cork-street, Dublin.

Vacancies.

POOR-LAW MEDICAL VACANCIES.

- Burton-upon-Trent Union.—Lullington District; area 2907; population 625; salary £10 per annum.
- Droxford Union.—Droxford and Loberton; area 13,154; population 3330; salary £55 per annum. Workhouse; salary £45 per annum.
- Kirkby Moorside Union.—Union; area 53,631; population 5739; salary £46 per annum. Workhouse; salary £11 per annum.
- Reigate Union.—Area 13,860; population 9817; salary £100 per annum. Workhouse; salary £50 per annum.
- West Ham Union.—The Woodford District; area 2143; population 3458; salary £50 per annum.

Births, Deaths, and Marriages.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

- FOX.—On October 28, at 12, Pavillion-parade, Brighton, the wife of O. A. Fox, L.D.S., of a daughter.
- HOMFRAY.—On October 26, at Tredegar, Monmouthshire, the wife of C. A. Homfray, M.R.C.S.E., of a son.
- LEDWARD.—On October 20, at York-street, Cheetham, Manchester, the wife of R. W. Ledward, M.D., of a daughter.
- RIDINGS.—On October 21, at Walmer, the wife of G. W. Ridings, Surgeon R.N., of a daughter.
- SEALY.—On October 8, at Spring-hill, Barbadoes, the wife of J. Sealy, M.D., of a son.
- SEYDEWITZ.—On October 22, at 21, Shadwell-road, Upper Holloway, the wife of Dr. Paul von Seydewitz, of a son.
- WARD.—On October 23, at Woolwich, the wife of W. P. Ward, Surgeon, Royal Artillery, prematurely of a son.
- WARDEN.—On Wednesday, October 31st, at 272, Huxley-road, Edgbaston, Birmingham, the wife of Dr. Charles Warden, of a son.

MARRIAGES.

- COMBE—AINSWORTH.—On October 24, at the private chapel of P. Ainsworth, Esq., Smithill's Park, Lancashire, M. Combe, M.D., Surgeon-Major Royal Horse Artillery, to Louisa Sarah, third daughter of the late T. H. Ainsworth, Esq., of Moss Bank.
- DAWSON—CHAPMAN.—On October 27, at St. Margaret's Church, Lee, Smith Houston Dawson, M.D., of No. 5, Carlton-terrace, Kilburn-park, to Rosie Annie, second daughter of Henry Chapman, Esq., of Lee, Kent.
- HALL—NOAKES.—On October 24, at Christchurch, Folkestone, H. J. Hall, L.R.C.P.L., to Eliza, second surviving daughter of Mr. John Noakes, late of Gillhope, Mayfield, Sussex.
- WILSON—HUNTLEY.—On October 29, at Percy Main, near Newcastle, Thomas Wilson, Esq., M.R.C.S.E., of Wallsend, to Sarah Hassall, third daughter of the late Dr. Huntley, of Howdon.

DEATHS.

- BURNETT.—On October 25, at Westbrooke House, Alton, Hants, C. M. Burnett, M.D., aged 60.
- CARTER.—On October 20, at Wellington-road, Dublin, J. C. Carter, M.D., Inspector-General of Hospitals.
- CONQUEST.—On October 24, at The Oaks, Plumstead-common, J. T. Conquest, M.D., F.L.S., (late of Finsbury-square), aged 77.
- CROCKER.—On October 16, in London, Henry Crocker, M.R.C.S.E., of Berbic (formerly Assistant-Surgeon R.N.), aged 42.
- DYER.—On October 23, at Stevenage, Herts, J. F. Dyer, M.R.C.S.E., aged 43.
- MCCARTHY.—On October 18, at Kenmare, county Kerry, Timotheus McCarthy, M.D. Edin., J.P.
- QUINLAN.—On October 19, at the Royal Military Hospital, Phoenix Park, Dublin, Thomas Quinlan, M.D., Assistant-Surgeon 1st Dragoon Guards, aged 32.

JAMES DUDGEON AND SON, AGENTS,
113, GRAFTON-STREET.

THE ADELAIDE HOSPITAL,
PETER STREET, DUBLIN.

Physicians:

HENRY H. HEAD, M.D., F.C.P., M.R.I.A.
JAMES LITTLE, M.D., L.K.Q.C.P., L.R.C.S.I.

Surgeons:

ALBERT J. WALSH, M.D., F.R.C.S.I., Member of Council, Royal College of Surgeons.
JOHN MORGAN, F.R.C.S.I., Professor of Practical and Descriptive Anatomy, Royal College of Surgeons.
JOHN K. BARTON, M.D., F.R.C.S.I., Lecturer on Surgery, Ledwich School of Medicine.
BENJAMIN WILLS RICHARDSON, F.R.C.S.I., Member of the Court of Examiners in the Royal College of Surgeons, and one of the Hon. Secretaries to the Surgical Society of Ireland.

Assistant Physician:

DAVID B. HEWITT, B.A., T.C.D., L.K.Q.C.P., L.R.C.S.I., Demonstrator R.C.S.

Assistant Surgeon:

ALEXANDER MACALISTER, L.K.Q.C.P., L.R.C.S.I., Demonstrator, R.C.S.

The WINTER SESSION of this Hospital commenced the FIRST MONDAY in OCTOBER. It now contains 100 beds, of which twenty-four are devoted to the Special Diseases of Infants and Children. There is a detached Fever Hospital for the treatment of Contagious Diseases.

CLINICAL INSTRUCTION.—Two Medical and two Surgical Lectures, including Lectures on the Diseases of the Eyes, will be delivered in each week; Bedside Instruction being given daily by both the Physicians and Surgeons. Practical Demonstrations in the use of the Stethoscope, Laryngoscope, and Microscope, as applied to the Diagnosis of Disease, will be given during the Session. Ophthalmoscopic Demonstrations every Saturday morning at 11 o'clock.

DISPENSARY.—There is a numerous-frequented Dispensary attached to the Hospital, which is attended daily by the Physicians and Surgeons.

FEES.—For Nine Months' Hospital Attendance, £8 8s. 0d.; for Six Months' Hospital Attendance, £6 6s. 0d.; for Summer Three Months' Hospital Attendance, £3 3s. 0d.; Perpetual Pupils (paid at entrance), £21.

PRIZES.—Two Medical and two Surgical Prizes will be given at the close of the Session.

Certificates of Attendance upon this Hospital are fully recognized by all the Licensing Bodies of the United Kingdom.

The central position of the Hospital, and its close proximity to the Schools of the Royal College of Surgeons and the Ledwich School, render it peculiarly convenient to Students attending those Institutions.

Further particulars can be obtained from Dr. Little, Secretary to the Medical Board, 24, Lower Baggot-street, or any of the Physicians or Surgeons.

Mater Misericordie Hospital,
ECCLES-STREET, DUBLIN.

SESSION 1866-67.

PHYSICIANS.
Dr. Hughes.
Dr. Hayden.

SURGEONS.
Dr. O'Reilly.
Dr. Ellis.
Dr. Stapleton.
Dr. Cruise.
Dr. Curran.

The Hospital is visited daily at Nine o'clock A.M.

TERMS OF ATTENDANCE:

Nine Months	£S 8 0
Six Winter Months	6 6 0
Three Summer Months	3 3 0

Certificates of attendance upon this Hospital are recognized by the Royal College of Surgeons in Ireland, by the King and Queen's College of Physicians, by the University of Dublin, and by all the Licensing Bodies in the United Kingdom.

For further particulars apply to F. R. Cruise, Honorary Secretary to the Medical Board, 37, Westland-row, or to any of the Medical Officers.

Dr. Steevens' Hospital and Medical COLLEGE, DUBLIN.

Physicians and Surgeons.

C. P. CROKER, M.D.T.C.D., Ex-Pres. R.C.P., M.R.I.A., Consulting Physician.

S. G. WILMOT, Ex-President of the Royal College of Surgeons, Visiting Surgeon.

C. FLEMING, Fellow and Member of the Court of Examiners R.C.S.I., Surgeon to the Richmond Hospital, Visiting Surgeon.

H. FREKE, M.D.T.C.D., F.C.P., M.R.I.A., Physician and Professor of Medicine.

W. M. BUAKE, F.C.P., M.R.C.S., Physician in Ordinary to his Excellency the Lord Lieutenant.

W. COLLES, Ex-President, Royal College of Surgeons, Surgeon and Professor of Surgery.

E. HAMILTON, M.D.T.C.D., F.R.C.S.I., Surgeon and Professor of Anatomy and Physiology.

Surgeon and Professor of Anatomy.

G. ST. G. TYNER, L.R.C.S.I., L.C.P., Resident Surgeon, Demonstrator of Anatomy.

S. L. HARDY, M.D., F.R.C.S.I., M.R.I.A., Physician-Accoucheur and Professor of Midwifery.

E. PERCIVAL WRIGHT, M.D.T.C.D., F.R.C.S.I., Surgeon Attendant to the Ophthalmic Dispensary, Professor of Botany.

J. A. BAKER, F.R.C.S.I., Surgeon-Dentist, Professor of Dental Surgery.

J. ALDRIDGE, M.D., M.R.I.A. Professor of Chemistry and Natural Philosophy.

C. A. CAMERON, M.D., F.C.S.L., Professor of Chemistry.

J. F. POLLACK, M.B.T.C.D., L.R.C.S.I., Professor of Medical Jurisprudence.

T. W. GAINSHAW, M.B.T.C.D., L.R.C.S.I., Professor of Materia Medica.

R. L. SWAN, L.R.C.S.I., L.C.P., Demonstrator of Anatomy and Curator of the Museum.

J. SHORRT, L.R.C.S.I., L.C.P. Demonstrator of Anatomy.

The Hospital contains 250 Beds, with distinct Wards for Fever, Syphilis, Diseases of the Eye, and Diseases of Females; there is also in connexion with the Hospital a Maternity Department, and an extensive Dispensary for Out-Patients.

SYSTEMATIC COURSES OF LECTURES are delivered during the Winter and Summer Sessions on all the subjects required by the College Halls, and the Public Service. These Lectures are given in a commodious Medical School, within the walls of the Hospital, whereby great saving of the students' time is secured, as well as more abundant opportunity of observing accidents and important cases, immediately on their admission.

Students enjoy the advantages of a Reading Room, Museum, and Lending Library.

There is accommodation in the Hospital for two Medical and six Surgical Resident Pupils as Dressers. Fee, £21, including Hospital Certificate.

Comfortable lodgings may also be procured in the vicinity of the Hospital (five minutes' walk from Phoenix-park), of which a Registrar is kept by the Resident Surgeon. Parents and Guardians have thus an opportunity of placing the Pupil under the supervision of one of the Surgeons or the Chaplain of the Hospital. Some of the Lecturers receive Pupils to reside in their families.

SPECIAL PRIVATE CLASSES are held for the preparation of Gentlemen for the Licensing Bodies and Competitive Examinations.

SENIOR, MIDDLE, AND JUNIOR EXHIBITIONS, with Cusack Medals, will be awarded at the end of the Session to those whose answering exhibit general proficiency in every branch of their professional studies.

There will also be Two Prizes for the best reports of the cases which have occurred in the Hospital during the Session.

TWO MIDWIFERY ASSISTANTS are each year (month of November) selected by competitive examination—salary £30 per annum.

THE DISSECTING-ROOMS, which are most spacious and well ventilated were opened on October 1st for Practical Anatomy. The Lecturers and Demonstrators attend unremittingly throughout the day, to assist the student in this most important pursuit.

The Sessional Courses of Lecturers will commence on the First Monday in November.

FEES, each Course—Hospital, £7 7s.; Lectures, £3 3s. Perpetual to both Hospital and School, 75 guineas, payable in two instalments.

Further particulars on application to Dr. Tyner, Resident Surgeon at the Hospital; or to E. Hamilton, M.D., Secretary, 120, Stephen's-green.

Westmoreland Lock Hospital, Dublin
WINTER SESSION, 1866-7.

The usual course of Clinical Instruction will be delivered in the Hospital during the Session.

SURGEONS.

THOMAS BYRNE, A.B.M.B., T.C.D., Fellow and Examiner, Royal College of Surgeons, Ireland.

BENJAMIN F. MACDOWELL, M.B., Trin. Coll., Dublin, L.R.C.S.I. Lecturer on Materia Medica, and Therapeutics, Ledwich School of Medicine, Honorary Physician to the Sailors' Home and Marine School.

Further information upon application to Dr. BYRNE, 187, Great Brunswick-street.

DISEASES OF THE EYE.

DR. JACOB will deliver a full Course of Lectures on the Anatomical Physiology, and Optical Mechanism of the Eye, during the ensuing Session, in the College of Surgeons, and also a separate Course on the Pathology and Diseases, with the Operations required in their Treatment, in the City of Dublin Hospital.

London Medical Press & Circular.

TREATMENT OF ASIATIC CHOLERA

ON THE
OPIATE OR ANTIDOTAL AND CONSERVATIVE
PLAN.

By WM. BEAMISH, M.D., M.R.C.S.E.,

PHYSICIAN TO THE CORK FEVER HOSPITAL AND COUNTY AND CITY
OF CORK JAILS.

As Asiatic cholera has now come amongst us, and as I find that, notwithstanding the experience we have had, there are still so many conflicting opinions as to its pathology and treatment, and so many going over the beaten track, thereby losing not only time but life by persevering in remedies already tried and found ineffectual—one advocating the eliminating or purgative plan, another emetics, another astringents, another calomel, another the expectant or do-nothing plan, and another the mechanical plan, and none proving satisfactory—having had considerable experience in its treatment, and taken a particular interest in it, and much trouble in recording the results of my treatment in the years 1849 and 1853, when it prevailed here, and as one bedside fact is worth a thousand theoretical observations, I have resolved upon laying aside all private considerations, expressing my views of its nature and treatment, and publishing forty-six cases treated by me in the Cork Fever Hospital, and Hospital of County Cork Jail—thirty-eight on the opiate, or, as I think it might be called, the antidotal or conservative plan, and eight promiscuously, having previously tried all other methods in vain. Out of the thirty-eight I lost but eight (two in hopeless collapse when seen), and out of the eight I lost three (two under saline treatment). I may here mention that I was driven, I may say, to unusually large doses of opium in ordinary diarrhoea and dysentery previous to the outbreak of cholera, finding the usual astringents and ordinary doses perfectly ineffectual. When cholera, therefore, appeared I was naturally led to test its efficacy in of course large doses again.

The fact is, as long as we are at issue as to the nature of cholera, and therefore what the indications of cure are, so long must our treatment in this disease as in all others prove, to say the least, experimental, empirical, and therefore unsatisfactory. The question is—Is cholera a blood poison, or a disease caused by prostration or suspension of the vaso-motor powers? If a blood poison, why should it not be eliminated or carried off by the kidneys as well as by the bowels? Why should nature select one and reject the other? We all know how often nature takes advantage of the kidneys, as a critical outlet in serious diseases.

With regard to the exciting cause of the disease, there are so many conflicting opinions, so many ingenious theories have been advanced, and so much written upon the subject, that time will not permit me to discuss the matter here. I shall, therefore, merely say that I think we may rationally suppose it to be caused by some peculiar atmospheric condition capable of unlimited diffusion, and rendered more active by local or predisposing causes, as miasmata, want of cleanliness and ventilation, overcrowding, &c.; but whatever may be the exciting cause, the brain and great nervous centres, the solar, gastric, and splanchnic plexuses, seem to me to be primarily and principally involved, so far as being deprived of their tone and energy (a remarkable peculiarity in cholera being retention of consciousness to the last), hence headache, vertigo, deafness, noise in ears, and a train of symptoms follow which

constitute the disease. The nerves of circulation and respiration are also implicated.

It may be defined an exhausting disease, in which there is an excessive elimination of disintegrated blood, an inverted state of the system, what should pass off by skin and kidneys passing off by stomach and bowels. The indications or requirements of cure therefore appear to me to be—first, to restore the tone and energy of the brain and nervous system; 2ndly, to check all excretions and determination to internal surface (the cause of præcordial oppression, or, as the patient expresses it, "crushing of the heart," so much complained of); and 3rdly, to promote capillary circulation and cuticular secretion, and counteract effects of vascular depletion.

The desideratum to baffle cholera, therefore, seems to be to discover some medicine that will promptly (FOR TIME IS EVERYTHING) meet these indications, and will be soothing to the mucous membrane, stimulant to the nervous system, astringent, and non-eliminative.

Opium, I assert, answers all these requirements of cure, if given at once, and in doses suitable to the stage of the disease (as quinine is given in ague), and in proportion to the quantity, quality, and frequency of the discharges, and amount of nervous prostration. I know no drug which exercises more, or even as much influence over the nervous or sympathetic system as opium, and therefore (if my view is correct) the only medicine to be relied on in cholera, particularly if aided by the horizontal posture, which for obvious reasons must be rigidly enforced even in the premonitory diarrhoea; also by every means calculated to promote perspiration, so as to reverse the inverted state of the system, as external heat by hot solid substances, viz., bottles or jars of hot water, hot bricks, and hot sandbags placed in the axillæ and between the legs; also hot mustard stupes to feet, and sinapisms over region of heart and pit of stomach. The judicious and moderate use of cordial stimulants spiced, and copious warm, spiced diluents, as whey, toast water, mint tea, soda water, and cold water *ad libitum*, to which I find the addition of a little sweet spirit of nitre renders it not only grateful but useful in tending to skin and kidneys; drinks of the dilute nitro-muriatic or sulphuric acids are also grateful and useful; the patient always craving for "something tart;" a little iced water is also very palatable, and tends to allay the sensation of burning heat in the epigastrium, the incessant thirst and irritability of stomach. Perspiration tends to excite the absorbent system, so that where this is the case less opium is required; also to counteract the possibility of any narcotic effect from the opium, which in itself produces a most extraordinary amount of perspiration, so much so that the nurse-tenders in charge of the cholera patients used to remark "that they were tired of mopping them."

Opium, then, besides allaying pain, promotes warmth, gives energy and tone to the capillary circulation, calms irritation of nervous system, and equalizes the balance of the circulation, and it is "conservative" in its effects, inasmuch as by controlling or checking the losses it sustains the strength, gives time for treatment, counteracts injury to the alimentary canal and shock to the nervous system from too rapid and profuse losses. As fullness in the blood-vessels of the brain is a sure preventive to the use of opium, so is an emptied state of the vessels (as in cholera) an indication for its use, and an anæmic or exsanguinated state of the vessels of the brain disarms the opium of its narcotic property.

The effect produced on the brain and nervous system in cholera is, in my opinion, in many respects similar to that caused by prostration of nervous energy from sudden and excessive loss of blood, as in uterine hæmorrhage, where opium (as is well known to the profession) is one of our most valuable medicines, and the quantity that can be borne without narcotism when the losses are excessive is incredible. In an excellent work lately published on cholera by Dr. MacPherson, the case of "a sickly Indian native" is mentioned, who took 600 drops of laudanum in

one night and recovered; and "a gentleman was saved from impending death by taking 400 drops; it never in the largest quantities produced affections of the head." Not only is it useful in vascular depletion, but in affections of the nervous system, as lockjaw, where two ounces of the tincture is said to have been taken with advantage and without narcotism; also where pain is present, as in passing of renal calculi—in fact, in every affection where it meets a counteracting agent. It is therefore in cholera the antidote, and this is one reason why the doses I have given had no narcotic effect. In cholera, therefore, it is useful not only in checking excessive secretions and vascular depletion, but in counteracting great nervous depression, exciting the animal electricity, and by its stimulant properties correcting the anæmic state of the vessels of the brain, thereby maintaining the equilibrium of the cerebral circulation, and favouring a certain amount of congestion and consequent pressure necessary for healthy cerebral action.

A. T. Thompson says—"In all cases where there is a deficiency of blood in the capillaries, opium is to be preferred to the salts of morphia, its stimulant properties excite the capillaries, which relieves the internal congestion, and brings on sweating as a critical exertion. Combined with aromatics it increases its stimulant effect and lessens its sedative; it increases the energy of the brain and contracts the diameter of the vessels which include the excretory ducts through which the serum passes, and diminishes all the secretions and excretions except the cuticular, which it promotes." Dr. Armstrong in his work on scarlet fever, says with regard to opium—"I cannot better illustrate the effects of this drug in cases where excessive irritation and debility exist without organic lesion than to compare it to the effect which it produces in the last stage of cholera morbus, sometimes snatching patients from the jaws of death. My general experience of the efficacy of this medicine in copious eruptions of blood, fully confirms the commendations which Dr. Stewart has bestowed upon it in uterine hæmorrhage, when the system has been excessively exhausted by loss of blood, or extreme nervous agitation arises. This agitation is often so surprisingly calmed by opium that I have seen patients seemingly in the jaws of death saved by its administration."

Dr. Hughes (assistant-physician to Guy's Hospital) says—"I consider cholera a huge drain from the alimentary canal, which, whether excreted from the anus or merely secreted into the intestines, I believe to be the true cause as well of the collapse as of the diminution or cessation of the secretion of bile and urine. For stopping this drain I have found nothing so effectual as a large dose of solid opium by the mouth, followed by astringents of ammonia and opium in a fluid form, with an enema of starch and full dose of laudanum. If these means are employed early in cholera (and by cholera I mean neither diarrhœa, however profuse on the one hand, nor the collapse of cholera on the other), I believe this will be found generally effectual in checking the disease."

Mr. Brown trusted to opium alone in solid form; Mr. Delany, opium in fluid state (150 drops in brandy). Tweedie and Gassalie found opium more effectual than any other remedy. Orton and Sydenham "opium the sheet anchor, and one dose enough to cure the disease" (see Orton's Essay on Cholera in India). Welshman, opiates and diluents. Jobert, laudanum in seltzer water. Ryan, "full doses of opium to allay disturbance of nervous system, brandy and ammonia to support strength, and full doses of opium to arrest the discharges, the disease being thus easily cured." Tweedie says—"Cholera may be arrested at any period anterior to collapse by efficient doses of opium—the Chinese opium and camphor." Dr. Mahir employed in the Polish army large doses of opium and prussic acid. Dr. James Johnson lauds stimulants and astringents as severally well adapted to the stages of diarrhœa and collapse. "The fit (he says) is readily arrested by opiates, if recent, and the blood not too far deprived of its serous constituents."

I could quote many more eminent authorities in support of my views of the nature and treatment of cholera did time permit me, want of which, together with anxiety that the result of my observations and experience should be made public while the disease is amongst us, must plead my apology for the crude and imperfect manner in which they must therefore appear. In advocating the use of opium, and on reference to the cases I have treated, it will no doubt be remarked that the dose has, in some cases, far exceeded that usually given in the most obstinate cases of ordinary diarrhœa. The fact, however, of the total absence of the usual narcotic effect of a large dose of opium, except in one case (where twelve grains and a half were taken at one dose, with perfect recovery from cholera), proves, I think satisfactorily, the tolerance of this drug, especially when the same dose (short gr. ss.) was given in a similar case without the *least inclination to sleep*; on the contrary, the patient's remark was, when asked how she felt some hours after she had taken it, "I would be quite well now if I had a little sleep," and twenty-five drops of the tincture of opium now had the desired effect. This fact proves how absurd it would be to expect any benefit from such a dose as a grain of the powder or fifteen drops of the tincture in a case of cholera, as has been recommended. It should also inspire confidence in those who believe opium to be the remedy (and I believe the majority of those who have had any experience in the disease are of this opinion), but are afraid to give a suitable or efficient dose. Much better not give it at all, as, under those circumstances, it is not only sure to fail, but to get a valuable remedy into disrepute. With regard to the narcotic effects of opium in cholera, it is necessary it should be borne in mind that patients dying in cholera generally die comatose, or apparently narcotized, and I have, therefore, known instances where those appearances were attributed to an over-dose of opium, where, in some cases, it had not been given at all, and in others where the dose taken could not by possibility have had the effect. The tolerance of the drug may be accounted for in three ways:—1st, by its narcotic properties being counteracted by meeting the poison in the system (by poison, I mean loss of the vital fluid)—in other words, by its being the antidote; 2nd, by the inactivity of the absorbents; and, 3rd, by the exhausted state of the nervous system, which is in itself an antidote to the effects of stimulants, and creates a tolerance of wine and opium, proving, therefore, the utter inutility, nay, serious consequences (as it is time lost) of prescribing even for ordinary diarrhœa (especially when cholera is epidemic) a smaller dose of the tincture than from twenty-five to forty minims for an adult, and for an actual case of Asiatic cholera, with a pulse distinct, a smaller dose than three grains of the powder, with a drachm of the tincture, or about six or seven grains; and in a more aggravated case, short of collapse, a larger dose again, say six grains and a drachm of the tincture, or about nine or ten grains. I have often checked a case of decided cholera in the earlier stage with a drachm of the tincture, or from sixty to one hundred minims. Where vomiting is not very frequent, I prefer giving the medicine in draught; but when it is constant, in pills, as you can see them if rejected, and repeat accordingly, whereas if the fluid is rejected, you are, of course, at sea as to how much is retained, and therefore how much to repeat; and I may here remark that, as in the most fatal cases vomiting does not often occur till near collapse, the treatment should not be the less active. Cramps are also often absent in the most fatal forms, and you may have a case of malignant Asiatic cholera, without either purging or vomiting, "cholera siccæ," the most rapidly fatal form—a proof, I think, of my view of the nature of the disease (nervous paralysis or prostration), as I have originally mentioned. These are, however, fortunately rare and exceptional cases in this country, especially without purging, and occur only, in my opinion, when the shock to the nervous system has been so sudden and so great that there was no power or time

for the system to rally, as in a case of death from a stroke of lightning, or sudden concussion from any cause acting on the great nervous centres. Rapidly fatal cases have been described in India where spasm had been the only symptom; but on post-mortem examination the bowels were found distended with the characteristic fluids. Out of sixty cases described by Dr. Jackson, in his report of cholera in Paris in 1832, there were only two without vomiting and five without cramps, and in the "Medico-Chirurgical Transactions" for 1838, in twenty cases there were two without vomiting or cramps. The following is the form of pills and mixture I prescribe, called anti-cholera pills and mixture:—

℞ Pulv. opii, gr. xxiv.

— capsici, gr. xij., ℥ ut ft., massa c. ext. gentianæ. q. s. et in pilulas, xij. divide. Signr., "anti-cholera pills," from one to five, for a dose for an adult.

℞ Tinct. opii, ℥i.

Ætheris chloric.

Spt. an. mon. aromat. aa. ℥ss.

Mist. camph. ad. ℥viiij. ℥, in partes octo divide.

Signr., "anti-cholera mixture," one part for a dose for an adult.

I have hitherto ordered camphor, in addition to the above pills; but as my chief reliance is on the opium, as a small pill is so desirable, and as camphor adds so much to the bulk, I have omitted it, especially as I usually order the mixture with the pills, which contain some camphor. In the stage of actual collapse (hopeless collapse, as it is often not inaptly called), no drug will have any specific effect, and even if it were absorbed (so far as opium is concerned), it will not be so much indicated, as the losses it were meant to check will have subsided of themselves, the patient will have been drained; at same time I would by no means discard the use of opium, but feel my way with it in smaller doses, repeated according to circumstances, to assist in stimulating the brain and nervous system, and bringing about reaction. We must, however, trust very much to the *vis medicatrix naturæ*; at same time do all in our power, as in the earlier stages, to promote perspiration by external heat, sinapism over pit of stomach (and, if necessary, a small blister, and the surface afterwards sprinkled with morphia), and region of heart, and hot mustard stupes to feet, and give copious warm spiced drinks and stimulants, &c., as I have mentioned, for the earlier stage; and as absorption by the rectum, in this stage especially, is more likely than by the mouth, I would recommend starch and laudanum enemata, with the addition of acet. plumbi, also nutritive enemata.

In regulating the dose of opium for a case of Asiatic cholera it may be some guide if we keep three objects in view—1st, prescribe a dose sufficient to check the discharges (if they exist); 2nd, add to this a dose sufficient to restore the brain and nervous system to their normal state; and, 3rd, add further to these such a portion as will be sufficient to counteract the depleted or emptied state of the vessels. This will account in some measure for the dose being necessarily larger than on ordinary occasions, and why a smaller dose will be sufficient in collapse when the discharges will have ceased. The great secret I find is to hit off a sufficient dose at once, as no repetition will answer so well, and this is important also, as there is too often no time for repetition, and I don't see the use of ordering a medicine to be taken every quarter or half hour (as is so often done), when, in nine cases out of ten, the patient, if he lives to take a second dose, may be even in that short time in hopeless collapse. You must, therefore, hit off such a dose of such a medicine as will be likely to meet the indications in the shortest possible time. Give an ordinary or inefficient dose at first and the patient will assuredly be lost. With regard to infants and children, opium must of course be given with the greatest caution. A case has just occurred in the Cork Fever Hospital: a boy, aged seven years, brought in with serous purging and vomiting, pulseless, no urine, sunk countenance, and choleraic voice; two and a half grains

had the desired effect, and next day reaction set in with a good pulse, hot skin, and he passed urine twenty-four hours after admission. Every powerful agent requires limitation and control, and nothing can be termed a remedy that is not used under appropriate circumstances, nor can any medicine be given at all times innocuously. It is incumbent on me here to guard against the idea that a *large dose constitutes the treatment*; on the contrary it will be perceived by the cases I have treated that the dose varied from two or three grains to ten or twelve (the average I found to be about six grains); it is no "rule of thumb" matter, it requires great discrimination, judgment, and experience, and the dose must be regulated, as I have said before, by the stage of the disease, the degree of nervous prostration, and the character and amount of the losses; extreme cases will require extreme doses. But what I wish to insist on as the result of my observation and experience is, that opium, physiologically and pathologically speaking, is the remedy, but that success does not depend on it alone, but on the combined effects of the horizontal posture, external heat by solid substances, and every means calculated to produce perspiration; and I am confident that if every medical man carried in his pocket a small bottle of laudanum and pills, such as I have mentioned, and administered *on the spot and before sending to hospital*, not only would time (all important) be saved, but the disease (to say the least) would, in my opinion, in nine cases out of ten, be greatly, if not altogether checked, and the patient by the time of arrival at hospital be most probably in a fair way of recovery, and this I often found to be the case.

In the cases I have treated on the opiate plan, the absence of consecutive fever is remarkable, and may, I think, be accounted for by the checking of the discharges.

With regard to "elimination" or assisting nature, as it is called, founded on this occasion, I take for granted, on the very erroneous homeopathic principle of *similia similibus curantur*. I am on all occasions a great advocate for assisting nature, and think that the best way to do so is to use such a remedy as will produce such a state of things as nature would present *when in health*, and this view of assisting nature will, I think, bear out my treatment, as, when the efforts of nature are excessive, and therefore *injurious to health*, they must of course be controled; and here, as in my opinion the use of purgatives in cholera (if generally adopted) would be attended with serious results, I must say a few words.

If the diarrhoea is of a bilious character and attended with pain, and that there is a good pulse and foul tongue, and reason to suspect that it is caused by some offending matter keeping up irritation, and should therefore come off, I would eliminate, so far as one dose of castor-oil, or in preference some mild warm aperient, and even so, I would add a few drops of laudanum, so cautious would I be *during a cholera epidemic* of purgatives, especially saline or drastic. Dr. McIntosh, says, "he has known many destroyed by taking a laxative or emetic, and others fall into a state of collapse, while using saline medicines during prevalence of cholera;" and Dr. Laycock, in the *Medical Gazette*, says, "For my own part, I have such a dread of purgatives in Asiatic cholera that even after the patient is recovered I would allow two or perhaps three days to pass before prescribing even a gentle aperient, for fear of relapse." A case in point has just occurred to myself in hospital: a patient who had recovered from cholera, in whom the serous losses from the bowels had been, as he said, "so frequent he could not count them, before admission;" he got well, and was four days without a motion, when I ventured to give him a mild and warm aperient; the result was, it produced a return of the symptoms, and I had to treat him again in a modified form. He is now well. This I consider an important case, showing how cautious we should be in acting on a mucous surface, already over-acted on, even by gentle means, and in future I would prefer a simple warm-

water enema. In a late number of the *Medical Times and Gazette* I find observations so much in accordance with my views on the subject, that I think I cannot do better than quote them.

Speaking of the "efforts of nature," it says—"Let us see how nature deals best with poison, and how experience teaches us to treat cases in which the 'efforts of nature' may be either inadequate or excessive.

"Let us take the case first of a mineral or vegetable poison—say calomel, arsenic, or elatesium. Either of these substances, in certain quantity, sets up vomiting and purging, by which after a time 'nature eliminates the poison,' and the patient recovers; but let us suppose the dose very large, so that it gets, as we may believe, into the blood, that the vomiting and purging are intense and exhausting, does the physician aim at elimination, pure and simple? Not a bit of it; he seeks to put the patient into a state that shall render him less sensitive to the effects of the poison. He diminishes and controls the efforts of nature, so that a large dose of poison may act like a small one, and on a weak system like a strong one. The stronger the system the less violently does nature react against the poison; and that which will make a weak system act like a strong one is opium. Give repeated doses of calomel till they purge, producing, perhaps, intense tenesmus and bloody stools, and what is the treatment? Opium. Under the influence of this the poison is no more heard of; pain and discharges cease, and we may suppose that the poison eliminates itself quickly without damaging the alimentary canal.

"Let us take the case of poisons of a zymotic order—typhoid or cholera. If a moderate dose be administered to a patient in first-rate health and spirits, how does "nature" act? Why, she may not condescend to notice it. It is on patients exhausted, ill-fed, or already prone to illness, that the poison acts as a specific poison. To produce its full effect, it must provoke certain reactions in the system of the recipient; it must feed on the patient and multiply itself, and it is the weak, ill-fed, nervous, irritable, and exhausted who fall into those reactions and permit that multiplication most readily.

"Suppose, then, a population, breathing air, drinking water, swallowing dust, eating food with unwashed hands, all impregnated with cholera poison, and suffering from incipient bowel disorder. What is the indication? Is it to eliminate? Certainly not, but to recruit the forces, and to resist the action of the poison in the alimentary canal, and for fulfilling these indications the experience of half the world points to 'opium.'"

Dr. McCormac, writing in a late number of THE MEDICAL PRESS AND CIRCULAR, relates the circumstance of a house-to-house visitation in an Irish town. "Do you purge?" was the question asked, and if the answer was "yes," an opium pill was put into the respondent's throat "sans ceremony." The result was successful. The system at large, and the alimentary canal in particular, were soothed, comforted, and rested; the poison was "locked up," but could do no harm; the patient was protected. And this, concurrently with the experience of hundreds of practitioners in the last three cholera epidemics, shows that a soothing astringent and non-eliminative treatment of diarrhœa is a pretty good safeguard against the fully-developed phenomena of cholera.

With regard to "calomel," as it is still spoken of and prescribed, I must offer a few observations; and, first, I do not see how it is indicated, inasmuch as the hepatic function is not suspended. Though bile does not appear in the discharges, the liver is acting, and hence the distended gall bladder, always seen on post-mortem examinations;* the secretion is retained, not suppressed; and the suppression is the effect, not the cause of the disease.

We must first, then, cure the cause. Besides, calomel, though said to be a sedative in \frac{ij} . doses, is more or less an irritant, and those who advocate its use generally give it in small doses—they certainly steal in a little of the opium with it. Even so, calomel, in my opinion, only tends still further to promote a secretion from a membrane already too profuse.

Again, if it is "the specific action" is looked for, we all know how difficult it is to produce that, even when the absorbents are active, in a shorter time than from twenty to forty hours. I find, on reference to the "Fever Hospital Journal," that in the year 1849 a patient recovering from pneumonia, and while under the specific influence of calomel, was attacked, notwithstanding, with cholera; so much for its preventive or curative properties in this disease. Mr. Orton, in his essay upon "Epidemic Cholera in India," says—"Calomel was frequently found at the bottom of the fluid contents of the stomach, and adhering to the mucous membrane." Except in the consecutive fever, then, or in convalescence, I do not see how it is indicated; besides, it will not act until the morbid action is arrested by other means, or by the "vis medicatrix naturæ." I shall say nothing upon the application of "ice to the spine," strychnine, &c., &c., further than that I trust whatever experiments are tried they may be founded on something rational. *Stimulating* liniments or dry mustard rubbed into the spine may be useful.

A few words on Prophylaxis or preventive measures. As nothing predisposes more to an attack of cholera especially than fear (the disease being in my opinion of the nature I have stated), it is most important that the public mind should be impressed with the fact that it is within the reach of the profession when promptly and efficiently treated, and that there need not be so much apprehension in attending upon their sick friends on the scene of contagion, as in my opinion, generally speaking, it is only contagious when predisposed by fear, or from overcrowding and consequent want of proper air and ventilation, or from some depressing or debilitating cause; at all events it is not disseminated, as contagious diseases usually are, under circumstances of free intercourse. There are many proofs of its non-contagious character, which time and space do not permit me to enter upon. I shall merely mention the inefficiency of quarantine regulations in preventing its extension, and the extraordinary immunity from the disease of the nurses and medical attendants in constant contact with it, under the most unfavourable circumstances, compared with that of other contagious diseases. The shortness of the duration of the epidemic is, I think, another proof of its non-contagious nature, and the remarkable immunity of the rich compared with the poor. As preventive means, maintain the tone of the constitution and nervous system as much as possible; avoid everything tending to irritate the digestive system, particularly the abuse of alcoholic stimulants; observe regular hours, and avoid everything tending to fatigue and debilitate the nervous system, and exposure to cold or damp. Therefore, wear warm clothing, and a light flannel or silk belt round the abdomen, the great and rational object being to preserve the capillary circulation, particularly in this quarter, and thereby prevent receding of cuticular excretion to internal parts, and consequent congestion. Silk inside-clothing, as being a non-conductor of electricity, is very valuable, this essential to health being so deficient in cholera. As perspiration is the grand object to be attained in the cure of cholera, so is the preservation of the capillary circulation as a preventive to be preserved.

Diarrhœa (even of a bilious character), if excessive, should be judiciously checked; as, during a cholera epidemic, I have known it when allowed to continue soon run into serous cholera.

The necessity for cleanliness, proper ventilation, and above all things avoiding overcrowding, and the use of pure water, is so obvious and so universally dwelt on, I need only mention the fact; also the free use of disinfectants, added to the excrete, and sprinkled about the rooms—as

* Some pathologists have noticed in such cases a stricture at the mouth of the "ductus communis choledicus," preventing the flow of bile into the intestine, when pressure is made on the gall bladder.

Condy's Fluid, Carbolic Acid, McDougal's Disinfecting Powder, Chloride of Lime, &c. To insure pure water, boil and let it cool for use. Should any object (as of course they will) to these my views as to the nature of Asiatic cholera, the indications of cure or treatment, all I can say is, that both one and the other are the result of personal bedside observation, experience, and no small amount of labour; and that I am not therefore prejudiced in favour of my pathology or treatment of the disease, on any theoretical or fanciful grounds. On the contrary, should any more rational views of its nature and more successful mode of treatment in the same number of cases be shown me, I shall gladly avail myself of both one and the other. As it is, I have the gratification to feel that I have, under God, been enabled to save many lives, which, judging from past events, would have been sacrificed by other or more feeble treatment.

"Who'er thinks a faultless piece to see,
Thinks what ne'er was, nor is, nor e'er shall be."

In 1849, having published my treatment, I received a letter from a lady in Castlemartyr thanking me and begging of me "to continue to send help far and near," and stating that she had made inquiries of a clergyman in Belfast (where the cholera then raged) as to the result of the opiate treatment then adopted there, and that his reply was, that "having been one of the visiting committee of the General Hospital, sometimes passing whole nights there, in consequence of the conduct of the nurses to the patients, he had ample opportunities of judging of the treatment, and that he considered it eminently successful."

I cannot close these observations without recording a case of extremely malignant Asiatic cholera (in addition to the two already alluded to), just now convalescent in Cork Fever Hospital:—

October 25th, 1866, half-past nine o'clock P.M. Patrick Barry, æt. 15, paralyzed from birth at one side; serous purging and vomiting incessant; no pulse; surface livid; eyes sunk; no action from kidneys since the day before admission; vox cholericæ. *Hæbat pil. opii 2 (gr. iv.)*; external heat, spiced drinks and stimulants, mustard stupes, &c.

26th, half-past eight o'clock A.M. No discharge from bowels; vomiting still incessant; no pulse; no urine. *R. Pulv. opii, gr. ij.*; *sinapism epigastrio.*

Two o'clock P.M. No reaction; no purging; vomiting continues. *Hæbat mist. anti-cholericæ, ℥ss. (træ opii, ℥ss.)*

Five o'clock P.M. No pulse; vomiting quarts of serum on getting a teaspoonful of any fluid.

Half-past ten P.M. No discharge; skin icy cold; no pulse.

27th, nine o'clock A.M. No stool; vomited once since last visit; no pulse, but surface a little warmer. *Hæbat træ opii, ℥xx.*

Eleven o'clock A.M. Pulse distinct at 112, and action of heart distinct; surface warm and perspiring; slept a little; no vomiting.

Five o'clock P.M. Pulse 100; skin warm; bears everything on stomach.

Half-past ten P.M. Pulse 100; no discharge.

28th, nine o'clock A.M. Pulse 100, and fair strength; no action of kidneys, yet vomited once; no stool.

R. Spt. æth. nit.

Sp. vin. gal. aa. ʒj.

Aquæ, ʒj.

Ft. haust. stat. sumend.

Two o'clock P.M. No discharge; pulse 100; skin warm; tongue a little parched; a little fulness over pubis; catheter introduced and brought off a pint of urine (four days suppressed); gin, two ounces.

29th, eight o'clock A.M. No vomiting or purging; passed a quantity of urine; pulse 88, and strong; surface and countenance natural; convalescent.

When the primary symptoms in all diseases are made the most important, we shall then learn the advantage of

promptitude and efficient treatment, and the danger of delay and trifling practice, especially in Asiatic cholera.

If a powerful impression be not made at once, little good can be expected, so quickly does the stage of collapse set in; and it is to this fact being lost sight of—this golden opportunity lost—that the fatality may be attributed, rather than to its so-called incurable nature.

In support of my views as to the pathology and treatment of this disease, I beg to append the cases alluded to.

Want of space prevents us from publishing the cases, which shall appear in our next number.

NOTES ON
AFFECTIONS OF THE WOMB,
AND THE

PARTS IN IMMEDIATE RELATION WITH IT.

By G. de GORREQUER GRIFFITH,

PHYSICIAN TO THE FAMILIES OF THE OFFICERS OF MILLBANK PRISON;
PHYSICIAN TO THE HOSPITAL FOR DISEASES PECULIAR TO WOMEN AND CHILDREN; PHYSICIAN-ACCOCHEUR TO ST. SAVIOUR'S MATERNITY.

A CASE IN WHICH LABOUR WAS RENDERED TEDIOUS BY A BAND, FORMED OF THE MUCOUS MEMBRANE OF THE VAGINA, STRETCHING ACROSS THE POSTERIOR HALF OF THAT CANAL, INTERCEPTING THE PASSAGE OF THE CHILD.

Since my appointment to "the Hospital" I have had abundant opportunities of making vaginal and uterine explorations. In the course of these examinations I have rather frequently met with distinct bands formed of the lining membrane of the vagina, and so firm and dense that they make that canal divisible into pouches or pockets. These being arranged, in many instances, in a shelf-like manner, it is easy to understand how they become impediments to the advance of parturition, and cause a very great delay in the birth of the child.

These bands are not always mere projections of the vaginal membrane, or protrusions of the natural rugæ, which have become tough, dense (though not thick), and very slightly inelastic or unyielding, but are sometimes formed by the adjacent parts of the lining membrane becoming adherent together, so that a chamber is made to exist above and below, or between these bands, should there be more than one.

A third way in which these bands—if I may so term them—are formed is probably by the agglutination of the adjacent vaginal walls, or of the adjoining rugæ, the yielding of the plastic material by which the agglutination was effected, the subsequent development of this material into the organised tissue, and the projecting of the vaginal folds united together by it.

In this last case the band would be composed partly of the organised plastic material, and partly of the projecting rugæ or folds.

The term "band" is hardly applicable, not being sufficiently descriptive of the conformation to which I allude, and might be laid aside for the word "shelf," inasmuch as this latter conveys a more correct idea of the malformation.

My colleague, Dr. Oates, has, as well as myself, been not a little surprised at the frequency with which we have found bands or shelves.

I do not remember an instance of their occurring in unmarried women, and for the most part they were met with in women who had borne more than one child. They obtained most usually posteriorly, or laterally, or postero-laterally—that is, extending from the back of the vagina to one or even both sides of the canal, varying, according to size, from half moon shape to that of smaller segments of a circle.

I have no doubt that many of these shelves are the result of ulceration, or abrasion, affecting the cervix uteri,

or the lips of the os uteri, or both, as well as a contiguous portion of the vagina, and that as the ulceration, or abrasion, heals, the parts so contiguous become united, and form the shelf or band.

I can call to mind only one patient in whose person this thin wall or partition existed anteriorly.

Sometimes these bands or shelves exist higher up in the vagina than the level of the os uteri, and here would not perhaps be an obstacle to labour, though as the entire uterus was lifted into the abdominal cavity by the growing fœtus, the os uteri might be drawn up above the band or shelf (as the case would happen to be), and so the barrier to the birth of the child would come to be raised. It is possible that, as the vagina was elongated and stretched in the course of the growth of the child, the band or shelf might be obliterated; but, as the child descended, and the vagina became subjected to the pressure from above of the child's head, the malformation would probably again return, and the impediment to labour be created.

The shelves or bands were, however, most frequently met with either on a level with the os uteri or below it; and, when on a level with the os, were arranged in such a manner that the os could be drawn up above them, leaving them below, and capable of becoming an obstacle to labour.

I shall now proceed to relate a case in which labour was retarded and very much interfered with by one of these bands or shelf-like partitions. The history of the case is as follows:—The patient was a young and strong woman, belonging to the artisan class; she had been, I understood, in very strong labour for some time before I had been called in, and the pains had been so sharp, frequent, and strong, but withal so ineffective to expel the child, that the gentleman who was in attendance had thought it better to remain near her during the two days and nights preceding my visit, and had sent for me because he feared that the child could not be born without the aid of instruments, or the woman delivered unless at the expense of the child's life.

The general condition of the woman augured the necessity for immediate interference, and as the child was still living, the necessity was rendered the more imperative to save its life also.

The pains had become so feeble that the woman scarcely perceived them, and they were wholly insufficient for the birth of the fœtus; the vagina was hot, dry, tender, and swollen, and on passing the finger higher up there was felt a semi-lunar shelf-like curtain, formed by the projection of the vaginal mucous membrane. This I could liken to nothing else better than to the fold of tissues which connect the thumb and first finger together. It was dense, swollen from the turgescence of the blood vessels contained in it, unyielding, except so far as its turgidity could be relieved by steady, continuous pressure by which the blood vessels might be in a measure emptied. It was also dry, and instead of affording a guide to the more easy passage of the head, it was a very serious obstacle to its progression.

At first this swollen, dry, turgid, yet dense substance seemed to be the posterior lip of the os which had come down before the descending head, but on further and more careful examination I satisfied my mind that it was one of those shelf-like projections which had become altered to its present condition by the long-continued expulsive force exercised upon it.

While I was well larding the vagina and this curtain of mucous membrane which I have described, and emptying the engorged blood vessels of the latter by means of the fingers moved from side to side, a slight pain came on, and showed me at once how great had been the barrier to delivery, and how readily such barrier might be removed by proper management.

There was no undue largeness of the head of the child, no unnatural ossification of it, no deformity of the pelvis in any direction, nor, in fact, anything to account for the

delay which had occurred in the delivery, except the resistance offered to the descent of the head by the membranous curtain spread out below it, and against which the head was borne down by the contraction of the uterus.

Having applied my cold hand to the abdomen I found that I could induce uterine action, and, as I considered, sufficient to obtain the birth of the child. I therefore placed my left hand upon the abdomen, and by rubbing it with some degree of force, excited the womb to action. While the left hand was thus engaged, the fingers of the right, introduced into the vagina, were employed in emptying by pressure the turgid vessels which entered into the structure of the membranous shelf, and as soon as a pain came on it was encouraged by renewed and more vigorous friction, at the same time that the tumefaction of the membranous shelf was reduced, and, as the head was borne down by the uterine contraction, the shelf itself, which so long had opposed labour, was shifted, or, perhaps, rather pushed up over the child's head by means of the forefinger.

I now felt quite confident that the labour would be soon terminated, and encouraged my patient by assuring her that one good bearing down pain would release her from her sufferings.

Not waiting to administer ergot, I proceeded with the abdominal friction, the sudden application of cold to the abdomen, and the reducing the size of the membranous curtain; and with the return of the next pain my patient was delivered from all her anguish and her suspense.

There was no difficulty encountered in the removal of the afterbirth. The child was of a natural size, and it was evident that the only cause of delay had been the membranous shelf which I have described.

I would mention that my very first care on seeing the woman was to administer sufficient brandy and cold water to rouse the entire system to action, and to procure a more ready response on the part of the womb to any efforts which we should make to obtain uterine activity.

9, Lupus-street, St. George's-square, Belgravia.

TREATMENT OF TYPHUS FEVER BY TEA; WITH CASES.

By THOMAS WRIGLEY GRIMSHAW, M.B.,

ONE OF THE PHYSICIANS TO CORK-STREET HOSPITAL; LECTURER ON
MATERIA MEDICA IN STEEVENS' HOSPITAL.

(Continued from page 463.)

Case 22.—Bessie T.—, aged 16 years; ten days ill before admission; admitted September 26th; maculated. This case was treated with two-ounce doses of infusion of tea every three hours, and was on the way to recovery when handed over to Dr. Mason on October 1st, after which she was convalescent in a few days.

Case 23.—Eliza Ludlow, aged 20; six days ill before admission; admitted September 17th. Highest temperature, 105°, on September 24th (thirteenth day). Convalescent on nineteenth day. Treatment consisted of infusion of tea, two ounces every three hours, until the thirteenth day, when the patient got suddenly worse, and ten ounces of wine were administered on this and the following day. On the sixteenth day the wine was reduced to eight ounces, and by two ounces each successive day, until the nineteenth day, when the patient was convalescent. The tea was continued along with the wine. The head symptoms were severe on the thirteenth day, and leeches were applied to the temples.

Case 24.—Margaret R.—, a case transferred from Dr. Mason on August 31st, having had rheumatic fever, from which she was convalescent. On the 15th of September she gave symptoms of having typhus, and in a few days the disease with all its character was fully established. Maculæ appeared on the 19th. The patient was treated with infusion of tea, with some sulphuric acid added, as

there was a tendency to diarrhœa. On the 24th eight ounces of wine were given, the case not being improved. The wine was increased to ten ounces on the 28th, after which the patient improved, and the wine was at once reduced by two ounces a day until two ounces were reached, which was continued until after convalescence had taken place. The tea was continued during the whole course of the case.

Case 25.—Mary W—, aged 18; ten days ill before admission; admitted September 25th; densely maculated on admission; became delirious the following day. Tea was administered in this case, but as the wakefulness was very great, the tea had to be discontinued, after which morphia and tartar-emetie were given, leeches and a blister applied to the head, before the patient was quieted. When transferred to Dr. Mason, on October 1st, she was still delirious, but soon became quiet, and is now well.

Case 26.—Mary B—, aged 40; ten days ill before admission; admitted September 12th; maculated. This case appeared to be recovering when admitted, as the spots were fading, and the temperature falling. Owing to the weakness consequent on removal from her home, she was given four ounces of wine, which was continued for two days. She was otherwise treated with two-ounce doses of infusion of tea every three hours. Convalescent on the sixteenth day.

Case 27.—Patrick B—, aged 39; six days ill before admission; admitted September 1st; densely maculated with large dark spots; cold when admitted, but easily warmed by hot jars and blankets; quite stupid, and could not be moved; pulse 90, but very weak. Infusion of tea, three ounces every third hour; wine, eight ounces. The tea was continued until convalescence took place on sixteenth day. The wine was increased to ten ounces on the twelfth day, and then gradually diminished to four ounces when convalescent. This was an unusually severe case of typhus, and at first there were slight hopes of his recovery.

Case 28.—Anthony M—, aged 20; eight days ill before admission; admitted September 3rd; maculated; complaining much of head, to which leeches were immediately applied. The highest temperature, $104^{\circ}5$, was reached on the eighth day. Complicated with some bronchitis. Treatment—Three-ounce doses of infusion of tea every three hours, until the thirteenth day, when four ounces of wine were given, as the case had assumed a very severe aspect, and the pulse became very weak. The wine was gradually increased, until it reached sixteen ounces on the seventeenth day; after the eighteenth day it was diminished. The patient was not convalescent until the twenty-fifth day. This was as severe a case of typhus as I have seen recover.

Case 29.—Mary G—, aged 38; five days ill before admission; admitted September 1st; densely maculated with very large spots. The patient was a very fat woman. Bronchitis became a very urgent complication towards the close of the case, being most so after the typhus symptoms had begun to subside and the spots were fading. This case was treated with tea and wine until the spots had disappeared, after which attention was directed to the bronchitis alone, which was treated with turpentine. Wine was given on the fourteenth day to the amount of eighteen ounces; later on the wine was almost totally replaced by whisky. The highest temperature, $104^{\circ}15$, was reached on the eighteenth day, and the patient was convalescent on the twenty-fourth day, the convalescence of the case having been prolonged by the bronchitis.

Case 30.—John R—, 15 years of age; ten days ill before admission; admitted September 21st; densely maculated; temperature $104^{\circ}5$. Treated at first with infusion of tea; but the patient being seized with cholera on the fourteenth day, it became necessary to add whisky and wine to the treatment; the former was administered in ounce doses made into punch every two hours, the wine was given to the amount of twelve ounces per day. The case, which is detailed in THE MEDICAL PRESS AND

CIRCULAR of October 31, was also complicated with abscess of the left parotid and hypopyon of both eyes.

Case 31.—Laurence F—, aged 34 years; eleven days ill before admission; admitted September 11th; densely maculated with large dark spots; highest temperature on thirteenth day. The patient was convalescent on the twenty-second day. Treated with infusion of tea, three ounces every three hours, wine six ounces, whisky two ounces. This was a severe case, which had been neglected before admission.

Case 32.—Thomas K—, aged 30 years; stated to be five days ill before admission, but probably eight or nine days; admitted September 24th; looked like a patient who had had cholera. Given large quantities of tea, wine, and whisky, without any improvement. Died on October 30th.

Case 33.—Robert M—, aged 30; fourteen days ill before admission; admitted September 21st; a few rose spots on skin, which afterwards increased in number; pain and gurgling on pressure in right iliac region; no diarrhœa; diarrhœa supervened to a very slight extent on the 27th. Treated with infusion of tea, with two ounces of dilute sulphuric acid added to each eight ounces, an ounce every two hours. On the occurrence of diarrhœa, solution of muriate of morphia, thirty minims, was added to the eight ounces of infusion of tea. The patient was convalescent on October 3rd.

It will be seen from the foregoing cases, that twenty-one cases of typhus were successfully treated by tea, without any other internal remedy of importance; and that some of these cases were of a very severe character. Case 1 got a little wine, but not sufficient to be considered as having any effect on the result of the case. Of the remaining cases, Case 23 got ten ounces of wine for a few days, but the quantity was immediately lowered; Case 24 got ten ounces of wine, for one day only, after which it was quickly reduced. In Case 25 the tea was found to disagree, and had to be discontinued; in Case 26 only a small quantity, four ounces of wine daily, was given. Case 27 got ten ounces of wine for one day, but it was also rapidly reduced. Case 28 got large quantities of wine, but this was a remarkably severe case. Thus we have six cases treated with wine and tea both, but in most of these cases only a small quantity of wine was given. Cases 29, 30, 31, and 32 got whisky in addition to the wine and tea, the two former on account of the peculiar condition of the cases; the two latter, on account of complications arising during their progress; but even in Case 30 the wine and whisky given were not in any great quantity. Case 33 is the only case of typhoid I have had an opportunity of trying the tea treatment upon, and, of course, being a single and not very severe case, the results are not sufficient to found any conclusions upon.

On the whole, the cases detailed, although not very numerous, show unusually favourable results in the treatment of fever, only one death having taken place in thirty-three cases. The success attendant upon the treatment is, I think, quite sufficient to justify the further trial of tea as a remedial agent in typhus and allied diseases.

I do not by any means wish to affirm that tea, and tea alone, will be found a "specific for fever," and that all cases can be successfully treated with it as a single remedy, but I believe that many cases can be so treated, although many others will require other remedies of a more powerfully stimulating nature. Tea will also be found to be a valuable adjunct to other remedies, as has already been shown by other observers.

I at first thought of employing caffeine, the active principle of tea and coffee, instead of infusion of tea, but found it too expensive and difficult to procure for use in hospital practice. I believe that a fluid extract of tea, deprived of its astringent matters, will be found the most convenient, and at the same time cheapest mode of administering tea as a therapeutic agent.

E C Z E M A .

If we can proceed on some sure grounds, we who through the whole day are engaged in the regular practice of medicine, the feeling of confidence which accompanies us all along relieves the mind of the largest share of what is called the harass of practice. Now, certainly, of the many disorders which fall within the daily medical treatment of every practitioner, those which arise from faulty or unhealthy quality of the blood are of constant occurrence.

In early life we know that heated states of blood quite short of any disease give rise to feverish attacks, bilious congestion, excitement of the brain, and a variety of the illnesses which we treat in children.

These "attacks" of disorder, as they are often called, appear mostly at the return of changeable damp seasons, or are felt more when the air is oppressive and loaded with moisture, chilly seasons of the year, repelling the perspiration from the skin, and throwing back on the feeble digestive organs the superabundance of the fluids in the circulation and in the blood generally. Now, as far as the period of infancy and childhood extend, this state is always relieved by acting on the various excretory organs freely—the liver, the skin, and the kidneys—or by emetics, as the old treatment was in the days of our ancestors. But also sometimes the nervous system becomes irritated, the excitement of the brain giving rise to spasmodic croup and irritable states of the mind and temper, which are the greater part of the sufferings of this earlier period.

And now, following upon this arrives the time of rapid growth, with a fresh and healthy impulse, youthful expansion of mind, and wider scope for exercise, acting most beneficially, it is said the youth has quite got over these attacks. Ourselves, fully comprehending the origin and principal cause of this class of disorders in children, we are at ease as to the result, and able to lay down a plan of treatment which will have the character of system and progressive advancement, both advantageous to the patient and to ourselves, pleasant from the confidence with which the treatment is carried forward.

But where the internal organs are weak and heated, though not thus oppressed, and eczema decidedly appears on the skin in children, then this class of aperiens which open and act on all the excretory organs is not required or to be made use of only most sparingly, for there is too great exhaustion going on from irritation. The painfully excited heat on the surface, taking down all the strength and power; and this great debility it is also really an object to remove. We cannot, however, act at all on a plan which will heat the blood; we cannot advance to this point. We must meet this difficulty half way, and endeavour to make out a plan of treatment which can supply the full amount of nourishment with the least possible irritation, heat, or excitement of the circulation. The watchful care of good nursing does the most in all cases of irritation, taken in the largest sense, it is a principal blessing and advantage—amply observable by all who are engaged in the treatment of this class of disorders specially. In its measure, indeed, we cannot fail of success, wisely to minister to the mind acted upon through the pressure of the outward natural body. Good nursing is certainly allied to good affections, and the best nursing to the best affections; for to sooth the mind of the sufferer from eczema is most essential always, and to use outward soothing applications, simple in their kind, forms a useful part of the treatment. Now, for a young patient, any one can get fine oatmeal, boil a large handful in water, adding it to each bath. This is a capital application afterwards, and at all other times. Thus, warm at the fire

℞ Hydrag. puecip. albi. ℥iv., sometimes ℥ij.

Ol. olivæ ℥iv.

Ol. verbena ℥j.

To apply on fine linen often.

There may be some advantage from a solution of bi-

borate of soda in elder flower water and glycerine, but the white precipitate liniment has the best effect. For the digestive organs nothing should be given to heat or clog them; as little sugar as can be used generally. Cod liver oil is certainly found in the Hospital for Skin Diseases very useful in this respect, that entering the circulation easily, it decidedly conveys nutriment to the skin, and it certainly fattens the tissues of the skin and of the whole body. If a little cod liver oil and some excellent cream and hot water are all shaken well together in a bottle, they are very good food, and do well for a time, but perhaps after a while the cream and the hot water and some rusks are preferred, but cream is always a capital form of nourishment. Gelatine and calves feet and broth are always light and wholesome food. Indeed, to express all in few words, it is evident that to nourish, while at the same time the blood is made of the least stimulating quality, and formed from food which least excites heat in the circulation, such a plan suited to each particular case affords the most reasonable hope of recovery.

Thus, melted isinglass can easily be put into thin broth, and toasted roll is light and can be made dry like rusk, and is very light of digestion. It is, perhaps, scarcely justifiable to mention food so largely and medicine so little; but it is obvious that the large quantities of stiff arrowroot and milk, and basins of meal and milk, good for stout children, are the continuance of disease in eczema.

M.D.T.C.D.

November, 1866.

Hospital Reports.

SIR PATRICK DUN'S HOSPITAL.

CASE OF LEAD PARALYSIS TREATED BY ELECTRICITY.

(Under the care of Professor BANKS.)

[Reported by Dr. WALTER SMITH.]

WILLIAM SHEFFIELD, aged 56, and married, by trade a house-painter, and a resident in Dublin, was admitted into Sir Patrick Dun's Hospital on the 10th of May, 1866.

At the time of his admission he was found to be labouring under partial paralysis of both upper extremities. It appeared that for the last forty years the patient had been engaged in painting, papering, or colour-grinding, and had colic twice before his present attack. He is a man of large build, and was always of very cleanly habits, at all times paying particular attention to his ablutions.

The first attack of colic took place about twenty-five years ago, and the second about nine or ten years subsequently, since which time he suffered nothing from the effects of the lead working. The right arm is the one principally affected; but the ring finger is affected in a marked manner on both hands. There is not complete drop-wrist and turning in of the hand. About a fortnight before his admission to Sir P. Dun's he had left another hospital, where he had been under treatment for a month, without deriving any benefit from it.

May 12th. Faradisation was applied for the first time to the right upper extremity. The muscles responded freely, and the patient did not complain of pain, even from a tolerably strong current. No medicine was given, except cardiac mixture.

14th. Electricity was applied to both arms, and already the patient considers that in the right limb he has more power over the fingers, but this may be ascribed to his present good spirits, as compared with his previous state of anxiety. As an instance of marked improvement, he can now button his shirt more readily than before.

16th. He can extend the ring-fingers much better, and can lay his hand flat against the wall—a feat he found difficult to accomplish at first. The current being applied

to both arms again, he feels that there is "more substance" in the muscles now.

19th. He is decidedly improved, and writes much better. The muscles of the right thumb, which were considerably atrophied, have now nearly regained their natural bulk and firmness, and he raises his arms with much more vigour; electrification continued; also the cardiac mixture, but no other medicine.

21st. Electrified both limbs again; his writing, which on admission was almost illegible, is now much firmer, and is easily read; he is improving in every respect.

23rd. Electricity continued, with most marked signs of benefit, with the exception of the ring fingers; he can now extend both hands readily; there is increased power in the deltoid muscle; he can write quite well.

25th. Both shoulders are quite strong now, and having for the first time since his admission attempted to shave himself, he accomplished that operation without any mishap; the left arm has recovered its strength, save in the ring finger; the right wrist is still weak, but is otherwise much better; the Faradisation was continued.

28th. Improving steadily.

June 1st. Electricity continued; he was able yesterday for the first time to shave easily with *one* hand; to-day he can hold a basin out straight in his right hand, while a few days ago he could not venture to lift it off the table.

4th. Continued electrification, with marks of progressive improvement.

7th. The electrification was applied for the last time. He has almost completely recovered the use of his fingers, and as he was anxious to go home, he was allowed to leave hospital, with directions to call on the 13th of June to report progress.

13th. He came up to hospital; he is gradually recovering the full use of his hands, and is now able to extend the ring finger of the left hand and keep it on a level with the others. He was cautioned against resuming work too soon; but as his means of livelihood depend on his occupation as a house-painter, he cannot refrain very long.

ST. MARY'S HOSPITAL.

HYDROCELE AND ITS TREATMENT.

By Mr. HAYNES WALTON,

SURGEON TO THE HOSPITAL AND TO THE CENTRAL LONDON
OPHTHALMIC HOSPITAL.

THE following is the summary of a clinical lecture given at St. Mary's Hospital, by Mr. Haynes Walton, in his course of clinical instruction:—

Mr. Walton commenced by telling his class that these lectures should always be strictly clinical, and based on the diseases of patients who had passed under their notice in the hospital. In the present instance he should take the subject of hydrocele, as he had recently operated on a case of this nature, and, as they might remember, he had made frequent remarks on the patient, and promised further detail in a lecture.

He gave a definition of hydrocele as a fluid tumour of the testicle or of the spermatic chord, and proceeded to speak of "Vaginal Hydrocele"—that is, hydrocele of the tunica vaginalis, and divided the varieties of this into the simple and congenital. He gave a sketch on the diagram slate of the several complications of hydrocele; but said that at present he should not go into those, though in a future lecture he would run through them.

He gave an anatomical exposition of the tunica vaginalis and its relation to the testicle, and illustrated what he said by some recent specimens. He showed from some pathological preparations the effect of inflammation on the tunica vaginalis and on the epididymis.

He showed also how it was that the body of the testicle

escaped when these parts were inflamed, namely, because it was surrounded by a dense fibrous covering which put a check to a continuation of the morbid action.

Vaginal hydrocele was decidedly a chronic affection, and the fluid of which consisted of water, albumen, uncoagulable matter, salts, and sometimes cholesterine.

The position of the testicle in hydrocele was one of importance. It was nearly always situated behind, and a little below the centre of the hydrocele, a preparation illustrative of which was exhibited. But there were varieties in the position arising out of adhesion between the tunica vaginalis; out of a multilocular condition of the tunic; and sometimes out of a mal-position of the testicle, by which it is reversed, so that the testicle might also be at the bottom of a hydrocele, at the top of it, on either side, or in front.

He considered the causes of hydrocele to be essentially of an inflammatory nature, having their seat either in the tunica vaginalis, or in the epididymis. He next passed to the physical characters of hydrocele, which he illustrated by a patient whom he brought into the theatre, and dwelt particularly on the difference in diagnosis between a hydrocele and an inguinal hernia. In the former the spermatic chord could nearly always be felt above the hydrocele, except in those rare cases, in which the hydrocele was prolonged close up to the inguinal ring; and there was no impulse given to the tumour in coughing. In hernia the swelling commenced in an opposite direction from above, and was usually largest in that direction; it received an impulse in coughing and did not conceal the testicle, which could always be felt at the bottom, except in congenital hernia. He should not at present, as before intimated, speak of the complication of hernia with hydrocele, but merely pointed out the difference between them. But the most important distinction was to be found in what was called the "light test," the examination of the hydrocele by transmitted light in a dark room, the manner of applying which was there shown. He advised this light test to be applied in all cases of doubt, as it would always give the translucent appearance except where the tunica vaginalis was thickened—a rare occurrence. He thought it better to look through a tube, as a stethoscope, for instance, when using the light.

The distinction between soft cancer, melanosis, and hydrocele was descanted on. He recommended an exploratory puncture to be made where there was doubt; and, he added, if you have doubt as to whether it be a hydrocele or a hernia, do not make a puncture, but a small dissection, as if you were going to operate for a hernia, and then you can do no harm, if a hernia be present.

Next followed the treatment, palliative and radical. The palliative was the mere tapping. The other was the process of exciting inflammation. For infants he recommended a kind of middle course; it was to puncture the hydrocele with a fine instrument, and allow the fluid to infiltrate into the scrotum, as that generally resulted in an easy and speedy cure. He thought this better than making the scrotum sore by any of the various blistering agents. The best plan of drawing away the hydrocele fluid, by tapping, was shown, and the danger of wounding the testicle or the chord was mentioned, and the avoidance of it advised by ascertaining, as far as may be, the position of the testis by touch, as pain was usually produced when it was touched, and by the light test. Respecting the radical cure, he said there were diversities of ways in bringing this about, as few subjects in surgery had received so much attention from remote antiquity to the present time. For years the seton had been applied. The same had been the case in the excision of a portion of the tunica vaginalis; in the use of the tent; the application of escharotics, and lastly the injection. The latter was the modern process, and for this different kinds of irritating substances had been lauded. The latest fashion embraced tincture of iodine, but the fact was, that there was no limit to substances that might be used with effect. He, himself, knew most of the result of the sul-

phate of zinc, which he employed of a strength of four grains to an ounce of water.

The after-treatment consisted almost entirely of rest of the patient; for it was seldom there was an excess of action, but generally the contrary, a want of it.

The treatment of congenital hydrocele was different to the above, in so much as it would endanger life to inject the hydrocele when it communicated with the cavity of the abdomen. It had been doubted whether these were cases of hydrocele at all, but rather supposed to be simple gravitation of fluid from the peritoneum. At all events, the right thing was to apply a truss to the external abdominal ring, the presence of which usually caused adhesions of the sides of the communicating aperture, which was always small; and this had the advantage in addition of preventing a hernia. As the hydrocele usually disappeared when the communication between the testicle and the belly was closed by the sides of the peritoneum adhering, there seemed to be some truth in the supposition about fluid gravitating from the peritoneal sac.

When the hydrocele did not subside under these circumstances, the injection might be used.

(To be continued.)

THE LONDON INFIRMARY FOR EPILEPSY AND PARALYSIS.

(Under the care of Dr. ALTHAUS.)

WITHIN the last few years several observations have been recorded showing that the sentient nerves, arising from the posterior roots of the spinal cord, are not indiscriminately endowed with the capability of conveying all the different kinds of sensation, but that there are special sets of nerves for the perception of pain, of temperature, of pressure, of tickling, of touch, and of locality; and that in certain affections of the nervous centres one or several of these different sets of nerves may have lost their vital properties, while others remain nearly or even quite unaffected. Thus Dr. Althaus has shown, in his paper on progressive locomotor ataxy, that in this disease sensibility to pain and the sense of touch may be diminished or gone, while the sense of temperature may be as acute as ever, and *vice versa*. Some cases of paralysis, which were lately under the care of the same gentleman at the London Infirmary for Epilepsy and Paralysis, point to the conclusion that that which holds good for the sentient nerves is also to a certain extent the case with the *motor nerves, which have to be subdivided into three different sets, as regards their relations to Faradisation, Galvanisation, and volition*. This discovery seems to be not only of pathological importance, but also opens up a prospect of therapeutical progress in cases which have hitherto appeared most intractable.

Jane B—, aged 62, a widow; had a first attack of hemiplegia about four years ago, from which, however, she soon recovered. In March, 1866, she had a second seizure, which was of a more severe character, the patient being unconscious for two days, and being completely paralysed in the left side for two months. At present (July 11th), the face and the leg have recovered—the former completely, the latter to a great extent; but the left arm is entirely useless, as only a very slight swinging movement in the shoulder-joint is possible, while the arm itself, the forearm, hand, and fingers are perfectly immovable. On applying Faradisation to the muscles, it appears that the serratus and the trapezius answer slightly to the stimulus, while all the muscles from the acromion downwards, have completely lost their excitability. Galvanisation of the nerves and muscles of the upper extremity, by a continuous current of from twenty-five to forty-five cells of Daniell's battery, has the same negative result. On the other hand, sensation is scarcely at all diminished, and the paralysed arm is 0°9 F. warmer than its fellow. The bulk of the two arms is almost exactly alike. The patient was put on a course

of iodide of potassium and hypophosphite of lime, under the influence of which her general health greatly improved. After two months, however, there was no change in the motive power of the arm. It was then determined to resort to Faradisation. The muscles even now appeared to be perfectly dormant under the Faradic stimulus, not the slightest contraction being produced by the application of a powerful current, which, however, was very distinctly felt by the patient. But from this time a marked and sudden improvement took place in the mobility of the arm, hand, and fingers, as well as in the response of the muscles to the continuous galvanic current. On October 9th all the muscles answer to the continuous galvanic current, on closing as well as on opening the circuit, yet the interrupted Faradic current even now produces no contraction in the muscles. The patient is now able to dress and feed herself, to do work about the house, &c., and is, at her desire, discharged.

Case 2.—George W—, a cobbler, aged 44; admitted on April 25th, 1866; has for the last ten weeks suffered from paralysis of the right portio dura, which he ascribes to having got wet through, and been exposed to a cold draught in a doorway. He is unable to close his eye, to laugh, or to whistle; the right nostril is "shut up," and he has great difficulty in speaking and swallowing. He complains of headache and occasional attacks of vertigo; otherwise he is in good health. Faradisation produces no contraction in the muscles of the face, even if a strong current be used; while a continuous galvanic current of ten cells of Daniell's battery causes muscular contractions on closing as well as on opening the circuit. This patient got quite well under the influence of the continuous current, and on being discharged, on June 27th, not only was the voluntary power over the facial muscles re-established, but these were also again influenced by Faradisation, entirely in the same manner as the muscles of the healthy side. Thus, in the former case, Faradisation served to restore those motor nerves which obey the orders of volition and of Galvanisation; while, in the latter case, Galvanisation restored those motor nerves which obey the orders of volition and of Faradisation.

A somewhat similar result has been noticed in several cases of lead-palsy, where those motor nerves which obey the orders of Faradisation had entirely lost their power, while the will and Galvanisation continued to exercise a feeble influence on the extensor muscles of the forearm. In these cases the internal use of iodide of potassium, together with Faradisation and Galvanisation combined, produced the desired result.

THE MEDICAL CLUB.

A MEETING was held at Hanover-square Rooms on Thursday, November 8th, with the object of establishing a club in London, for the social intercourse of members of the medical profession, British and foreign, to promote and maintain a mutual interest and fellowship between them, and to cultivate friendly relations with men of art, science, and letters, Sir WILLIAM FERUSSON, Bart., in the chair.

On taking the chair,

Sir WILLIAM FERUSSON stated that he presumed they were all aware of the object of the meeting, as they must have seen the advertisements in the daily papers and journals, and notices which, doubtless, all of them had received, as they were met with the purpose of establishing a club, similar in most respects to those great institutions which formed a peculiar feature of modern civilization. Most men were familiar with the peculiar features of modern clubs. Perhaps the oldest institution of the kind had not reached the age of half a century—he meant those larger buildings and aggregations of men, which constituted the so-called clubs of modern days, not those such as in Dr. Johnson's time, and of a prior date, which were limited to small numbers. He had nothing to say against such small clubs as those referred to, and was aware that many of them flourished vigorously even at the present time; but it was

the object of this meeting to give origin to a club which should, like others, be constituted of many hundreds, and that the prevailing element in it should be, that it would be chiefly constituted by men belonging to the medical profession. As some of the resolutions to be laid before the meeting would show, it was the earnest wish of the promoters of this scheme that men skilled in literature, art, and science at home should be associated in the movement. A proposal like the present was by no means new, for it had often been talked of in bygone years, but nothing had been seriously attempted until the present movement. He had often wondered, whilst clubs of the kind were arising in all directions, and under a great variety of auspices, that no effort had been made in the medical profession to develop such a scheme. Considering that in Her Majesty's dominions and dependencies there might be not less than twenty thousand members of that profession, it seemed to him remarkable that no such effort had been made. There were probably fourteen or fifteen thousand of the profession who were within easy reach of London, many of whom visited the metropolis once or oftener in the course of the year, and might avail themselves of the advantages of such an institution. There were thousands within the circle of London and its immediate neighbourhood who could hardly fail to take interest in it, and yet it seemed to him curious that five hundred or a thousand of these gentlemen had not joined in the formation of one. Looking to the fact that the medical profession was composed of highly educated men—educated in science perhaps beyond any other section of the community, and to the influence that it had in social life, as also the fondness of its members to associate cordially with educated men in other walks. He expressed astonishment that a movement like the present had never taken place before. It was now for the meeting to declare for or against the movement, and, for his own part, he did not see why the utmost cordiality should not prevail. He had a firm impression that out of a profession so large in numbers—some five hundred—one thousand or more would come forward and at once confirm the objects of the present movement. It could not be overlooked that the medical profession, in regard to social habits, stood in a different position to all others. In most of these the time for work as well as for leisure was perfectly known and arranged. A man could tell to a nicety when he was to be engaged and disengaged, but it was a feature with numbers of the medical profession that they held themselves at the call of the public at any minute, day and night. It was a feature in the profession of which we were proud, for we were gratified that our aid and skill should ever be of avail in behalf of our fellow-creatures at a minute's notice. He most cordially entered into this view as of leading interest, when applied to the mass of the profession. In particular, it was incumbent upon those beginning their career of labour, that they should hold themselves thus engaged day and night; but a man at forty-five was in a very different position to a youthful aspirant. Two-and-twenty or thirty years of active labour might make a man feel disposed for some independent relaxation. Then, he might long to associate more cheerily than ever with his contemporaries, many of whom had run a similar course, and the amenities of life might then appear more desirable. The members of the profession had often painful scenes and circumstances before them. They had to witness the distresses arising from bereavements in families, and frequently they could not for a time shake off such dismal impressions. Yet, they had their moments of happiness as well. It was peculiarly their office to be the first to offer congratulations on the arrival of a "little stranger," and often they had it in their power to relieve the anxieties associated with accidents and disease. Notwithstanding the intensity of his occupations, he did not see why a medical man should not have his social moments as well as others in the community. Considering the drudgery (if he might say so without offence) that all had to go through in early life—for example, the trials of the dissecting room and all others—before he could get a diploma or degrees, and looking to his anxieties in early life, he did not see why some social relaxations should not fall to the lot of the members of the profession to which they all belonged. A period might arrive in the life of any one when this might be desired, and such an institution as that about which they were met gave the desired opportunity. Even in the midst of all the anxieties

peculiar to the profession, he had often been pleased and gratified to witness how these might for a time be cast aside when members met in social intercourse. Much more that he might say would come better in association with the resolutions which would now be laid before them, and apologising for thus detaining them, he would now limit himself to the proper functions of the position which he had the honour to fill.

The Chairman then called upon the Honorary Secretary, Dr. Lory Marsh, to read the report, of which the following is a copy:—

The establishment of a club in London, for the social intercourse of members of the medical profession of this and other countries, has at different times engaged a considerable amount of attention. Almost all agree that such a club would be a great convenience; and as it is proposed to include as members gentlemen connected with other scientific societies, a further advantage will accrue by the cultivation of friendly relations with men of art, science, and letters. At present the number of members enrolled is upwards of three hundred, and doubtless many are waiting to see the local habitation of the club settled before joining. In this as in other clubs, the amount of entrance and subscription will be increased so soon as the opening of the club is decided upon; when opened, it is proposed to be worked on the proprietary principle, so that members shall not incur any personal pecuniary liability beyond the amount of their entrance and subscription.

All existing clubs are designed more or less with a view to the special convenience of some particular class of members. None of them, however, afford those conveniences which it is confidently anticipated a club of the nature we now propose to establish will possess. The club would require to be moderately economical. Members should in all cases be allowed to introduce their friends as visitors. Many of the members would reside out of London, and it is desirable they should, if possible, be provided with sleeping accommodation, so that they might find at the club a genial and comfortable home.
